Application Routing Policies | 655

Understanding Application-Based Routing | 655

About the Application Routing Policies Page | 658

Tasks You Can Perform | 658

Field Descriptions | 658

Configuring Advanced Policy-Based Routing Policy | 659

About the Rules Page (Advanced Policy-Based Routing) | 660

Tasks You Can Perform | 661

Field Descriptions | 661

Creating Advanced Policy-Based Routing Rules | 662

About the App Based Routing Page | 663

Tasks You Can Perform | 663

Field Descriptions | 663

Editing and Cloning Policies and Objects | 665

Assigning Devices to Policies | 666

Customizing Profile Names | 667

Publishing Policies | 667

Updating Policies on Devices | 668

Threat Prevention - Policies | 671

Creating Threat Prevention Policies | 671

Threat Prevention Policy Overview | 677

Benefits of Threat Prevention Policy | 678

Threat Policy Analysis Overview | 679

Implementing Threat Policy on VMWare NSX | 680

VMWare NSX Integration with Policy Enforcer and Sky ATP Overview | 680

Implementation of Infected Hosts Policy Overview | 682

Registering NSX Micro Service as Policy Enforcer Connector Instance Overview | 683

Before You Begin | 683

Infected Hosts Workflow in VMware vCenter Server | 683

Configuring VMware NSX with Policy Enforcer | 686

Example: Creating a Firewall Rule in VMWare vCenter Server Using SDSN_BLOCK Tag | 688

Threat Prevention - Sky ATP Realms | 691

Sky ATP Realm Overview | 691

Creating Sky ATP Realms and Enrolling Devices or Associating Sites | 692

Modifying Sky ATP Realm | 694

Threat Prevention - Custom Feeds | 697

Custom Feed Sources Overview | 697

Benefits of Custom Feed Sources | 698

Creating Custom Feeds: Dynamic Address, Whitelist and Blacklist | 698

Example: Creating a Dynamic Address Custom Feed and Firewall Policy | 704

Creating Custom Feeds, Infected Host | 706

Creating Custom Feeds, DDoS | 709

Configuring TTL Settings for Custom Feeds | 712

Threat Prevention - Email Management | 714

Sky ATP Email Management Overview | 714

Sky ATP Email Management: SMTP Settings | 716

Email Management: Configure IMAP | 719

Sky ATP Email Management: Whitelists and Blacklists | 722

Threat Prevention - Malware Management | 723

Sky ATP Malware Management Overview | 723

File Inspection Profiles Overview | 724

Creating File Inspection Profiles | 725

Creating Whitelists and Blacklists | 727

IPsec VPN-VPNs | 729

IPsec VPN Overview | 729

Creating IPsec VPNs | 730

Understanding IPsec VPN Modes | 736

Comparison of Policy-Based VPNs and Route-Based VPNs | 736

Understanding IPsec VPN Routing | 738

Understanding IKE Authentication | 739

Publishing IPsec VPNs | 740

Updating IPsec VPN | 741

Modifying VPN Settings | 741

Modifying General Settings | 742

Modifying Device Association | 743

Modifying Tunnel Settings | 743

Modifying Device Endpoint Settings | 743

Viewing Tunnels | 744

Importing IPsec VPNs | 744

IPsec VPN Main Page Fields | 748

IPsec VPN-Extranet Devices | 750

Creating Extranet Devices | 750

Extranet Devices Main Page Fields | 751

IPsec VPN-Profiles | 753

VPN Profiles Overview | 753

Creating VPN Profiles | 754

Editing and Cloning Policies and Objects | 762

Assigning Policies and Profiles to Domains | 763

VPN Profiles Main Page Fields | 764

Shared Objects-Geo IP | 765

Creating Geo IP Policies | 765

Geo IP Overview | 767

Deleting and Replacing Policies and Objects | 767

Shared Objects-Policy Enforcement Groups | 769

Creating Policy Enforcement Groups | 769

Policy Enforcement Groups Overview | 771

Deleting and Replacing Policies and Objects | 772

Shared Objects-Addresses | 774

Addresses and Address Groups Overview | 774

Creating Addresses and Address Groups | 775

Importing and Exporting CSV Files | 778

Assigning Addresses and Address Groups to Domains | 780

Showing Duplicate Policies and Objects | 780

Addresses Main Page Fields | 781

Shared Objects-Services | 782

Services and Service Groups Overview | 782

Creating Services and Service Groups | 783

Showing Duplicate Policies and Objects | 788

Shared Objects-Variables | 789

Variables Overview | 789

Creating Variables | 790

Editing Variables | 793

Importing and Exporting CSV Files | 793

Showing Duplicate Policies and Objects | 794

Shared Objects-Zone Sets | 795

Understanding Zone Sets | 795

Creating Zone Sets | 797

Editing and Cloning Policies and Objects | 799

Deleting and Replacing Policies and Objects | 800

Finding Usages for Policies and Objects | 801

Showing and Deleting Unused Policies and Objects | 801

Showing Duplicate Policies and Objects | 803

Viewing Policy and Shared Object Details | 803

Zone Sets Main Page Fields | 804

Shared Objects-Metadata | 806

Metadata-Based Policy Enforcement Overview | 806

Benefits of Metadata-Based Policies | 806

About the Metadata Page | 807

Tasks You Can Perform | 807

Field Descriptions | 807

Creating a Metadata | 808

Change Management-Change Requests | 810

Change Control Workflow Overview | 810

Benefits of the Change Control Workflow | 812

Setting Up the Change Control Workflow | 812

Creating a Firewall or NAT Policy Change Request | 813

About the Changes Submitted Page | 815

Tasks You Can Perform | 815

Documentation and Release Notes

To obtain the most current version of all Juniper Networks[®] technical documentation, see the product documentation page on the Juniper Networks website at <https://www.juniper.net/documentation/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <https://www.juniper.net/books>.

Documentation Conventions

Table 1 on page xxxiv defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xxxiv defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
Bold text like this	Represents text that you type.	To enter configuration mode, type the configure command: user@host> configure
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> show chassis alarms No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> Introduces or emphasizes important new terms. Identifies guide names. Identifies RFC and Internet draft titles. 	<ul style="list-style-type: none"> A policy <i>term</i> is a named structure that defines match conditions and actions. <i>Junos OS CLI User Guide</i> RFC 1997, <i>BGP Communities Attribute</i>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name: [edit] root@# set system domain-name <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> To configure a stub area, include the stub statement at the [edit protocols ospf area area-id] hierarchy level. The console port is labeled CONSOLE.
< > (angle brackets)	Encloses optional keywords or variables.	stub <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	broadcast multicast (<i>string1</i> <i>string2</i> <i>string3</i>)
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	rsvp { # Required for dynamic MPLS only
[] (square brackets)	Encloses a variable for which you can substitute one or more values.	community name members [<i>community-ids</i>]
Indentation and braces ({ })	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
; (semicolon)	Identifies a leaf statement at a configuration hierarchy level.	

GUI Conventions

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> In the Logical Interfaces box, select All Interfaces. To cancel the configuration, click Cancel.
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select Protocols>Ospf .

Documentation Feedback

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the [Juniper Networks TechLibrary](#) site, and do one of the following:

- Click the thumbs-up icon if the information on the page was helpful to you.
- Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
- E-mail—Send your comments to techpubs-comments@juniper.net. Include the document or topic name, URL or page number, and software version (if applicable).

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active Juniper Care or Partner Support Services support contract, or are

covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <https://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>
- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Create a service request online: <https://myjuniper.juniper.net>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

Creating a Service Request with JTAC

You can create a service request with JTAC on the Web or by telephone.

- Visit <https://myjuniper.juniper.net>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://support.juniper.net/support/requesting-support/>.

PART

Junos Space Security Director

[Overview](#) | 2

Overview

IN THIS CHAPTER

- Junos Space Security Director Overview | 2
- Juniper Networks Software-Defined Secure Network Overview | 21

Junos Space Security Director Overview

Security Director is a Junos Space management application designed to enable quick, consistent, and accurate creation, maintenance, and application of network security policies. It features an intuitive GUI that provides isolation from the underlying Junos Space Platform, allowing security architects, analysts, and security operators to focus on their jobs. Security Director provides visibility, simplified management, and actionable security intelligence for applications, users, IP addresses, and threats that help network managers make informed security decisions.

Security Director presents the security-focused administrator with a tabbed interface: The tabs across the top of the GUI provide workspaces in which an administrator can perform specific tasks. [Table 3 on page 2](#) shows the names of the tabs along with brief descriptions of what is accessible in that workspace.

Table 3: Tabs and Their Functionality

Tab Name	Accesses
Dashboard	Graphical security widgets that can be added, removed, and rearranged on a per user basis. These widgets offer each user a customized view of network security.
Monitor	Live threat maps and visual analysis of: <ul style="list-style-type: none">● Events received● User activity● Alerts and alarms
Devices	Device discovery and device management.

Table 3: Tabs and Their Functionality (*continued*)

Tab Name	Accesses
Configure	Security-related management including: <ul style="list-style-type: none"> • Firewall policies • IPS policies • NAT policies • UTM policies • VPN creation and management • Shared object management
Reports	Predefined security reports and the ability to create custom reports.
Administration	User and role management, logging management, and infrastructure management.

Benefits of Junos Space Security Director

- Offers a single centralized management interface that enables administrators to manage all phases of the security policy life cycle—stateful firewall, unified threat management (UTM), intrusion prevention, application firewall (AppFW), VPN, and NAT.
- Provides a simple user interface that enables new users to quickly become proficient.
- Automates the deployment of the most recent policy updates through the Policy Enforcer feature. The risk of compromise and human error is reduced as network administrators are able to work with a simple and concise rule set.
- Enables effective threat management while producing detailed data access and user activity reports. An action-oriented design enables the network administrator to detect threats across the network as they occur, quickly block the traffic going to or coming from a specific region, and apply immediate remedial action with a single click.
- Enables administrators to assess the effectiveness of each firewall rule and quickly identify the unused rules, which results in better management of the firewall environment.
- Simplifies policy creation and maintenance workflows through metadata-based policies, and streamlines threat remediation workflows through dynamic policy actions.
- Offers a seamless search function when correlating petabytes of data across hundreds of nodes.

Access and Log in

If you are working in the Junos Space Platform, you can access Security Director by selecting Security Director from the Applications drop-down list at the upper left corner of the Space GUI, as shown on the left side of [Figure 1 on page 4](#).

Figure 1: Security Director Access and Log in

After you log out of the Security Director GUI (or the login timer expires while in Security Director), the next time you log in the Security Director login screen will appear, as shown on the right side of [Figure 1 on page 4](#). Once you use the Security Director login screen, that will remain your default login location unless and until you navigate to the Space Platform URL or return to the Space Platform GUI and either log out from there or let the login timer expire.

When the Security Director application is accessed for the first time, a getting started guide will overlay the Security Director Dashboard page. The guide is designed to assist new and longtime users by providing a quick reference to where functions are located within the new GUI. The guide can be dismissed for subsequent logins and accessed later through the help button on the right side of the banner.

Using Navigational Elements

For a more personal, helpful, and customizable user experience, Juniper Networks has provided some aids within the GUI. Table 2 shows a sample of navigation, customization, and help icons.

Table 4: Navigational Elements

Element	Icon	Location
Breadcrumbs—Trace your location in the GUI. The breadcrumbs provide a path back to one of the six starting tabs: Dashboard, Monitor, Devices, Configure, Reports, and Administration.		Upper left part of main screen below the Monitor tab. Not visible on the Dashboard.
Info Tips—Hover your mouse over any available question mark icon for quick pop-up guidance.		Various places around the GUI.
Show and Hide Left-Nav—Click the hamburger icon to show or hide the left-nav section.		Left side of tab bar, below the Juniper Networks logo.
Show Hide Columns—In tabular displays, you can choose which columns are visible by clicking the icon and then selecting the check boxes on the menu.		Upper right corner of some tabular display windows such as the Reports tab and Devices tab.
Table Search—You can click this magnifying glass icon, within large tabular views, to search for specific text within any of the visible fields in the display.		Upper right corner of tabular views. Next to the Show Hide Columns icon.

Banner Overview

The dark gray bar at the top of the screen is called the Banner. It provides access to system-wide utilities such as a link back to Junos Space Platform, a global search utility, a domain switcher, a notification center, a profile management access menu, and a help button.

Figure 2: Banner

Junos Space Platform Link

Figure 3: Junos Space Platform Link

The GUI for Security Director is designed to enhance security focus. Therefore, for administration or other tasks that are not security related, you will need a way to switch back to the Space Platform GUI. In Security

Director, this can be accomplished by simply clicking the Juniper Networks logo in the upper left corner of the banner.

Search Utility

Figure 4: Search Utility

Sometimes you just need to search for things. Did I already create an address object for the corporate management network? Is there a URL category for gambling? If you find yourself in need of search capabilities, the Global Search Utility will fulfill your needs. Type a term into the search field and Security Director will show you all of the places where that term is found. The results lists are clickable, so that you can go directly to the found object simply by clicking.

Domain Switcher

Figure 5: Domain Switcher

Security Director supports multitenancy in the form of domains. Domains provide a customizable separation of managed assets and their configuration elements. See Domains Overview for more information.

Notification Center

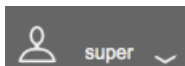

Figure 6: Notification Center

On the right side of the banner is a bell-shaped icon called the Notification Center. Clicking this icon reveals lists of the top alerts and alarms in Security Director. Clicking the View All Alarms or View All Alerts links at the bottom of the drop-down menu takes you to the detail page for the respective topic.

User Functions Menu

Figure 7: User Functions Menu

To the right of the Notification Center, there is a head-and-shoulders icon and a field showing the logged in user. Clicking your user name will allow you to access your user profile or log out of Security Director.

Help Button

Figure 8: Help Button

Access to the online Help system and the Getting Started Guide are available by clicking the right-most icon on the banner, shaped like a question mark. The help system includes access to a list of supported web browsers, user interface assistance, as well as links to technical support and full Security Director documentation.

Search Overview

You can search objects and devices from various tabs using a partial or full name, IP address, or other values. There are different categories of search in Security Director and supported patterns are regular expressions, partial word search, special character search, and so on.

Search Patterns

You can use the following regular expressions to search the objects.

- * (multiple character search)—If you do not know the full name of an object, use * at the start or end of the name.

For example, when you search with test* in addresses, ILP displays the following results as shown in [Figure 9 on page 8](#).

- test-2-SRX
- test_1-SRX

Figure 9: Multiple Character Search

Configure / Shared Objects / **Addresses**

Addresses ⓘ

<div> <div>test* ×</div> <div> <div>More ▾</div> <div>+</div> <div>✎</div> <div>×</div> </div> <div> <div>🔍</div> <div>🔼</div> <div>⋮</div> </div> </div> <div>✕ Clear All</div>						
<input type="checkbox"/>	▲ Name	Type	Hostname	IP Address	Description	Domain
<input type="checkbox"/>	▶ test-2-SRX	Host		1.1.1.1		Global
<input type="checkbox"/>	▶ test_1-SRX	Host		3.3.3.3		Global
2 items						

- ? (single character search)—You can replace a single character with ? in search text.

For example, when you search with test?org?net in addresses, ILP displays test.org.net result as shown in [Figure 10 on page 8](#).

Figure 10: Single Character Search

Addresses ⓘ

<div> <div>test?org?net ×</div> <div> <div>More ▾</div> <div>+</div> <div>✎</div> <div>×</div> </div> <div> <div>🔍</div> <div>🔼</div> <div>⋮</div> </div> </div> <div>✕ Clear All</div>						
<input type="checkbox"/>	▲ Name	Type	Hostname	IP Address	Description	Domain
<input type="checkbox"/>	▶ test.org.net	Host		3.3.3.3		Global
1 items						

Search limitations

- A partial name search with a single character replacement does not work. If the search text is split by any special character such as - , _ , / , ; , . , and ; and if you try to search with a partial name , results will not be displayed.

For example, if address object name is test-2-SRX, and you try to search test?2, then results will not be displayed.

However, you can do a full text search including as many ? in between the name like this: test?2?S?X.
See [Figure 11 on page 9](#).

Figure 11: Partial Name Search with Single Character Replacement

Search Categories

Global Search

Using global search, users can search any Security Director object including SRX Series devices with a name or an IP address. Global search checks the search text or IP address across all objects or devices of Security Director and displays the results in the user interface.

For example, if you create a firewall rule, scheduler, address, and service with same name in Security Director and search that name using the global search text box, the results are displayed with domains.

Global search results are displayed in the format Name of the Object | Type of the Object | Domain Name.
See [Figure 12 on page 10](#).

Figure 12: Global Search

ILP Search

All objects and devices pages such as, address, service, firewall policy, firewall rule, and so on have search boxes at the right corner (ILP search box). You can search using a name, a device IP address, and so on.

For example, in a firewall rules table, you can search the rule by using a name, a zone, an address, a scheduler name, and so on as shown in [Figure 13 on page 10](#).

Figure 13: ILP Search

Column Search

You can perform a granular level of search using column level search in the complex tables, which has more data, such as firewall, NAT, IPS, VPN policies, rules table, and devices table.

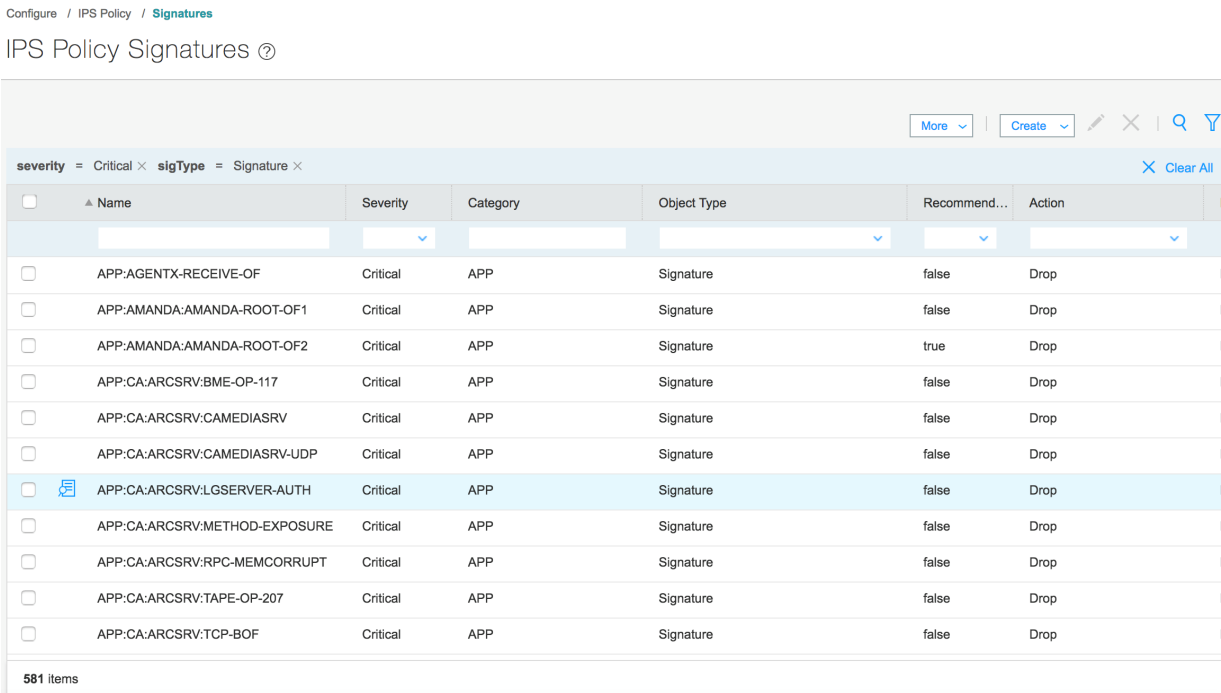

If you click the column search icon placed at the right corner of the table, near the search icon, the column search text box is displayed in the user interface. You can filter records using one or more columns. See [Figure 14 on page 11](#).

Figure 14: Column Search

For example, using the Severity and Object Type columns for IPS signature, obtain your results. See [Figure 15 on page 11](#).

Figure 15: Column Search-Example1

For example, if you want to search with an IP address, the corresponding subnet address and address group will also be listed in the search result. If the IP address of one of the address objects is 2.2.2.2 and it is part of the 2.2.2.0/24 subnet address object and ADDR-G1 is the address group, then both IP address and subnet address are displayed in the result. See [Figure 16 on page 12](#).

Figure 16: Column Search-Example 2

Item Selector Search

You can use a search text box to select items for inclusion in a rule or policy.

For example, when creating an address or service group, you can first search for the address or service object. Similarly, in firewall, IPS, and NAT rule creation, source and destination addresses can be searched in the item selector using a regular expression, a full name, and a partial name. See [Figure 18 on page 13](#).

Delimiter Search Limitations

The search text should not contain a delimiter that marks the beginning or end, such as a comma, hyphen, and so on. You can search the object by partial word or with * at the end of the text.

For example, if object names are test-SRX, test-SRX-UK, test-SRX_US, and so on, then you cannot search with test-, results will not be displayed as shown in [Figure 19 on page 13](#).

Refresh Search Index

If you have any issues while searching for newly added or existing object in any category, such as global, ILP, and column search, then you can trigger the refresh search index from the Junos Space Network Management Platform page. Based on the number of objects, such as the number of address, service, and firewall policies in Security Director, the refresh search index might take more or less time.

In Junos Space Network Management Platform page, select **Administrator > Application**. Right-click Security Director and click **Refresh Search Index**. See [Figure 21 on page 15](#).

Figure 21: Refresh Search Index

Wait for about 10-15 minutes, and then try to search objects again in Security Director.

NOTE: This operation should not be performed frequently. This can harm the overall Security Director performance.

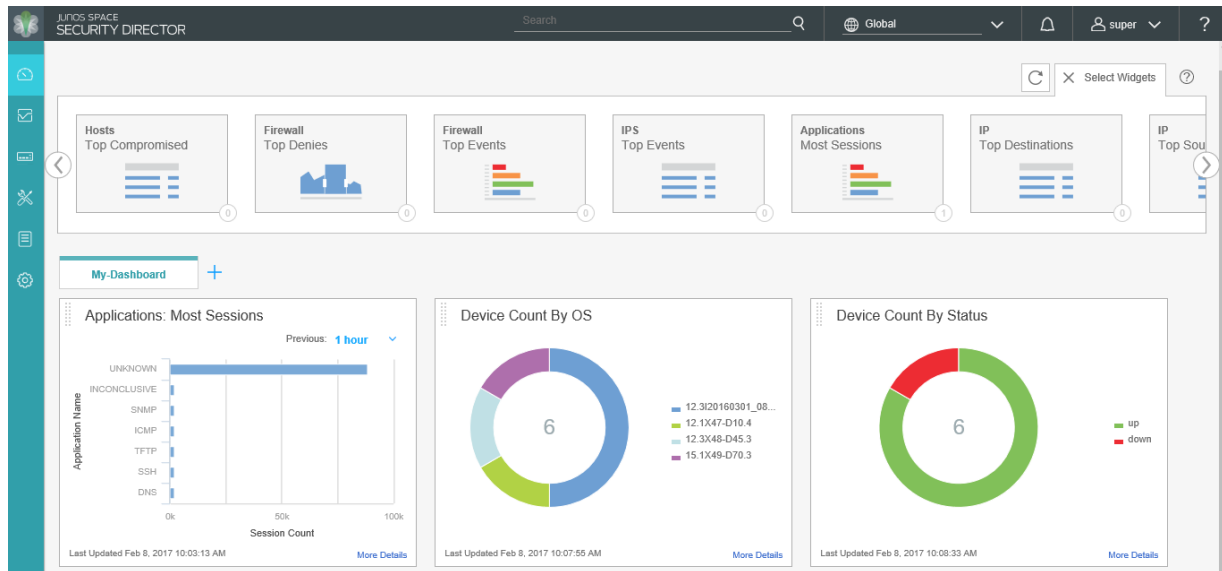

Main Workspace Overview

The main workspace of Security Director takes up the remainder of the browser window and is divided by six horizontal tabs just below the Banner. As shown in Table 1, the six tabs are: Dashboard, Monitor, Devices, Configure, Reports, and Administration. Each workspace and its accessible functions are described later in this document.

Dashboard

The Dashboard is the main landing page for Security Director. It is the first thing you will see each time you log in. Therefore, Juniper Networks has provided a means for you to be presented with the network security information that you are most interested in. You can customize the workspace in your Dashboard by adding widgets from the carousel below the banner. The placement of, and settings within, widgets are saved so that anything from device information to firewall event information or from top blocked viruses to live threat maps can be unique for each user. Once you decide on the widgets that you want to see, you can close the carousel to regain some screen space.

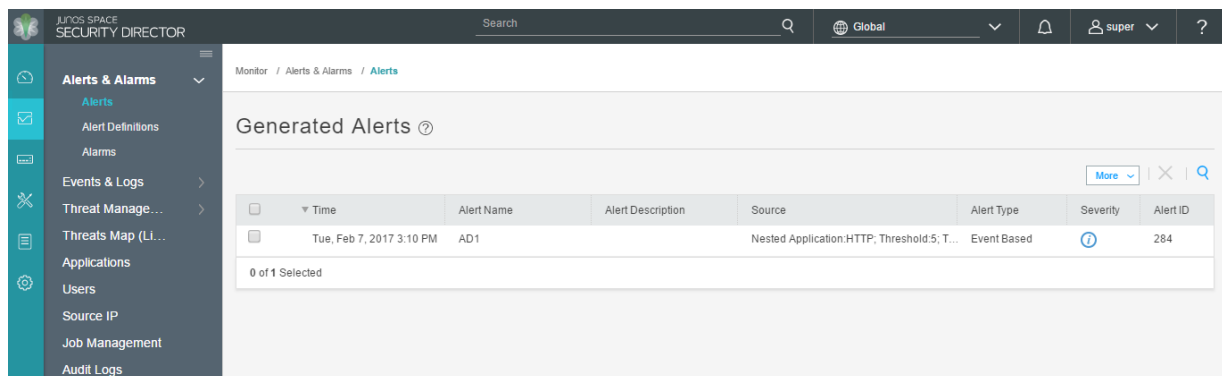

Figure 22: Security Director Dashboard Tab

Monitor

The Monitor tab provides a workspace in which graphical representations of network traffic, firewall events, live threats, and network user data are available. There is also detailed data for alerts and alarms and job management information. In this workspace, you can review the detailed information needed to understand what is happening to the managed security devices and traffic in your network.

Figure 23: Security Director Monitor Tab

Devices

The Devices tab provides a workspace in which you can add and manage Security Director devices. There are several columns of information available by default. This includes live CPU and memory data, and running software version and platform information. Schema mismatches are easily visible so that you can correct them before updating a device.

NOTE: Before working with a particular device in Security Director, ensure that the proper DMI Schema is available. If there is a mismatch between the device's software image and the schema version that Security Director is using to manage the device, unexpected behavior will result. DMI Schema management is performed in the Junos Space Platform Administration workspace.

Figure 24: Security Director Devices Tab

	Device Name	IP Address	OS Version	Schema Version	CPU	Storage	Authentication Stat
	DC-SRX1400-1 0 LSYS(s)	10.206.32.245	12.3X48-D45.3	12.1X46-D35.1 [Mismatch w...			Credentials Based

	interconnect-logical-syst...	10.206.34.198	12.3I20160301_0803_1chen	12.1X46-D35.1 [Mismatch w...			NA
	Is-DhyanLogicalSystem ...	10.206.34.198	12.3I20160301_0803_1chen	12.1X46-D35.1 [Mismatch w...			NA

Configure

The Configure tab is the workspace where all of the security configuration happens. You can configure firewall, IPS, NAT, and UTM policies, assign policies to devices, create and apply policy schedules, create and manage VPNs, and create and manage all of the shared objects needed for managing your network security.

Figure 25: Security Director Configure Tab

The screenshot shows the 'Configure / Firewall Policy / Policies' page in the Junos Space Security Director. The left sidebar contains a navigation menu with options like Firewall Policy, Policies, Devices, Schedules, Profiles, Templates, User Firewall M..., Application Fire..., SSL Profiles, IPS Policy, NAT Policy, UTM Policy, Threat Prevention, IPSec VPN, Shared Objects, and Setup Wizards. The main content area is titled 'Firewall Policies' and displays a table of policies. The table has columns for Seq., Name, Rules, Devices, Publish State, Last Modified, Created By, Modified By, and Domain. It shows two policies: 'All Devices Policy Pre' (Seq. 1) and 'All Devices Policy Post' (Seq. 2), both in 'Not Published' state. A summary at the bottom indicates '0 of 2 Selected'.

Seq.	Name	Rules	Devices	Publish State	Last Modified	Created By	Modified By	Domain
POLICIES APPLIED BEFORE 'DEVICE SPECIFIC POLICIES' (1 policy)								
1	All Devices Policy Pre	Add Rule		Not Published	Tue Jan 31,2017 4:25 PM	System		Global
DEVICE SPECIFIC POLICIES (0 policy)								
POLICIES APPLIED AFTER 'DEVICE SPECIFIC POLICIES' (1 policy)								
2	All Devices Policy Post	Add Rule		Not Published	Tue Jan 31,2017 4:25 PM	System		Global

Reports

The Reports tab provides a workspace in which you can create and send reports to other interested parties. The reports available on the Dashboard tab are a subset of the reports available here. When run, the report engine provides both graphic and numeric data for a complete visualization of the log data. Security Director comes with a predefined set of reports, and you can add your own customized reports from scratch or by cloning any of the predefined reports.

Figure 26: Security Director Reports Tab

The screenshot shows the 'Reports / Report Definitions' page in the Junos Space Security Director. The left sidebar contains a navigation menu with options like Report Definitions, Generated Reports, and Setup Wizards. The main content area is titled 'Report Definitions' and displays a table of report definitions. The table has columns for Name, Description, Type, Report Content, Schedule, Recipients, and Job ID. It shows 13 predefined reports, including 'Top IPS Attacks...', 'Top Monitored IPS Intrusions', 'Top Services on...', 'Top URL Accessed through firewa...', 'Top SECINTEL...', 'Top Destination...', 'Top Source Countries', 'Top IPS Attacks By Source Countr...', 'Top Roles', and 'Top IPS Attacks Detected'. A context menu is open over the 'Top Monitored IPS Intrusions' row, showing options like 'Run Now', 'Preview as PDF', 'Send Report', 'Edit Recipients', 'Edit Schedule', and 'Clone'. A summary at the bottom indicates '1 of 37 Selected'.

Name	Description	Type	Report Content	Schedule	Recipients	Job ID
Top IPS Attacks...	Top IPS Attacks By Destination C...	LOG	Top IPS Attacks by Destination C...	Unknown		0
<input checked="" type="checkbox"/> Top Monitored I...	Top Monitored IPS Intrusions	LOG	Top Monitored Intrusions	Unknown		0
Top Services on...	The service on which the IPS has ...	LOG	Top Services on Which IPS Event...	Unknown		0
Top URL Acces...	Top URL accessed through firewa...	LOG	Top URLs Accessed	Unknown		0
Top SECINTEL ...	Top SECINTEL and AAMW event...	LOG	Top SECINTEL events, Target Ho...	Unknown		0
Top Destination ...	Report for Top Destinations by Co...	LOG	Top Destination Countries for Den...	Unknown		0
Top Source Cou...	Report for Top Sources by Countries	LOG	Top Source Countries for Denied ...	Unknown		0
Top IPS Attacks...	Top IPS Attacks By Source Countr...	LOG	Top IPS Attacks by Source Countr...	Unknown		0
Top Roles	Top Roles By Count	LOG	Top Roles	Unknown		0
Top IPS Attacks...	Top IPS Attacks Detected	LOG	Top IPS Attacks Detected	Unknown		0

Administration

The Administration tab provides a workspace in which you can manage role-based access control (RBAC), review and manage audit logs, manage logging, review and update the IPS signature database, and manage

your login profile. Domain RBAC allows system administrators to logically divide Security Director into sections called domains. Policies, objects, logs, and services created for devices within any one domain are available for use only within that domain. User access can also be restricted to individual domains. For more information regarding RBAC, see [“Domain RBAC Overview” on page 1072](#).

Figure 27: Security Director Administration Tab

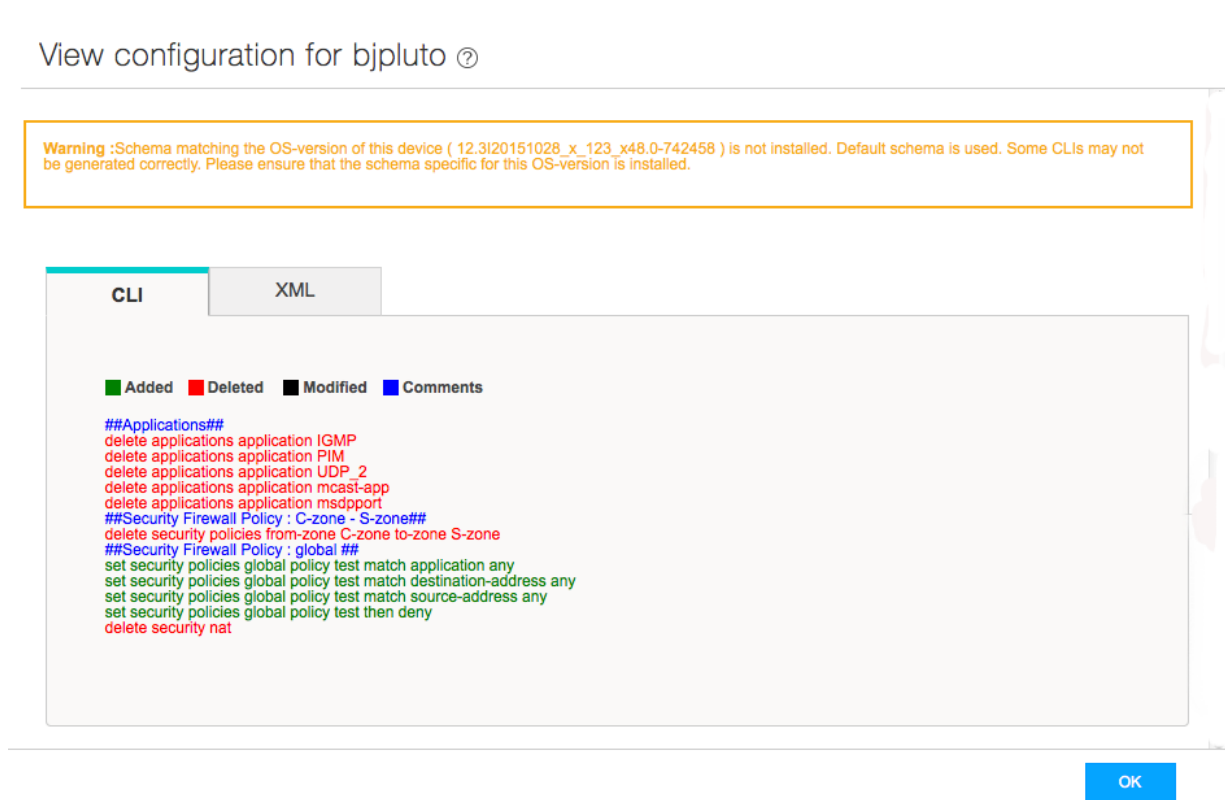

Global Features

Security Director contains assistive workflow wizards that guide you through some of its security functions. These include a rule-creation wizard and an add-device-profile wizard.

The publish workflow allows security configurations to be created or changed, assigned to devices, published and then updated to those devices. Policy changes, whether to IPS, Firewall, or any other managed policy can be staged by network operations center (NOC) personnel, previewed and approved by network administrators, and updated to the devices individually or all at once during maintenance windows or as often as needed by using the publish workflow. Figure 9 shows a sample of a configuration preview that could be used to review the changes that Security Director would make during the next update.

Cloning allows quick duplication of everything from objects, to rules, to entire policies. When dealing with complex rules or policies, cloning to make changes can ensure that there is a consistent starting point from which to make changes.

Figure 28: Configuration Update Preview

The configuration preview is available as CLI commands or as XML.

Conclusion

Security Director is a security management application designed with speed and scale in mind. Shared objects can be created and used across many security policies and devices. Firewall policies, NAT policies, and others can be created, changed, managed, and applied to individual devices or to groups of devices.

RBAC and domain features enable the Security Director administrator to allow access to many levels of users while restricting the visibility that they have into sensitive security information. Security devices, users, shared objects, and policies in one domain remain inaccessible to users who do not have access to that domain. Thus service provider organizations can provide customer isolation, allowing them to diversify their customer base. User management can be performed locally within Security Director, or remotely using central user management systems such as RADIUS.

And finally, events received by Security Director are logged and correlated in various ways, providing graphical and numerical charts that are understandable and actionable. Reports based on this information can be run and sent directly to stakeholders within an organization. The reports can show security and user trends over time, helping decision makers to craft concise and accurate security policies.

Juniper Networks Software-Defined Secure Network Overview

The Juniper Networks Software-Defined Secure Network (SDSN) provides end-to-end network visibility, allowing enterprises to secure their entire network, both physical and virtual. Using threat detection and policy enforcement, an SDSN solution automates and centrally manages security in a multi-vendor environment.

The Juniper Networks SDSN solution is comprised of the following components:

- A threat detection engine—Cloud-based Sky ATP detects known and unknown malware. Known threats are detected using feed information from a variety of sources, including command control server and GeolP. Unknown threats are identified using various methods such as sandboxing, machine learning, and threat deception.
- Centralized policy management—Junos Space Security Director, which also manages SRX Series devices, provides the management interface for the SDSN solution called Policy Enforcer. Policy Enforcer communicates with Juniper Networks devices and third-party devices across the network, globally enforcing security policies and consolidating threat intelligence from different sources. With monitoring capabilities, it can also act as a sensor, providing visibility for intra- and inter-network communications.
- Expansive policy enforcement—In a multi-vendor enterprise, SDSN enforces security across Juniper Networks devices, cloud-based solutions, and third-party devices. By communicating with all enforcement points, SDSN can quickly block or quarantine threat, preventing the spread of bi-lateral attacks within the network.
- User intent-based policies—Create policies according to logical business structures such as users, user groups, geographical locations, sites, tenants, applications, or threat risks. This allows network devices (switches, routers, firewalls and other security devices) to share information, resources, and when threats are detected, remediation actions within the network.

With user intent-based policies, you manage clients based on business objectives or user and group profiles. The following are two examples of a user intent policy:

- Quarantine users in HR in Sunnyvale when they're infected with malware that has a threat score greater than 7.
- Block any user in Marketing when they contact a Command and Control (C&C) server that has a threat score greater than 6 and then send an e-mail to an IT administrator.

Using user intent-based policies allows network devices (switches, routers, firewalls and other security devices) to share information, resources, and when threats are detected, remediation actions within the network.

Unlike rule-based policies, which can contain several rules, you can define only one set of parameters for each user intent-based policy defined on a device.

Benefits of Juniper Networks Software-Defined Secure Network

- **Management and visibility** - Enables you to view traffic across the network, dynamically deploy security policies and block threats. SDSN manages the entire network infrastructure as a single enforcement domain, thereby providing enforcement points across the network. Uses machine learning and data mining tools to offer effective threat management while producing detailed data access and user activity reports.
- **Comprehensive security** - Ensures that the same security policies are applied across all of the devices in the network. It extends security to each layer of the network, including routers, switches, and firewalls.
- **Protection from advanced malware** - Provides automated offense identification and consolidates the threat intelligence with threat hunting activities to simplify and focus attention on the highest priority offenses.
- **Automated policy or enforcement orchestration** - Provides real-time feedback between the security firewalls. Reduces the risk of compromise and human error by allowing you to focus on maximizing security and accelerating operations with a simple, concise rule set.
- **Scalability** - Supports up to 15,000 devices.
- **Third-party integration** - Provides APIs to integrate with the ecosystem partners for capabilities such as cloud access security, network access control, and endpoint protection, and additional threat intelligence feeds.

PART

Dashboard

[Overview](#) | 24

Overview

IN THIS CHAPTER

- [Dashboard Overview | 24](#)

Dashboard Overview

The Junos Space Security Director dashboard provides a unified overview of the system and network status retrieved from SRX Series devices. You can drag widgets from the carousel at the top of the page to your workspace, where you can configure them to meet your needs. When you install Security Director with Junos Space Log Director, the new Log Director dashboard is displayed.

To display the dashboard, select **Security Director > Dashboard**. The carousel displays all the widget thumbnails by default. You can customize your dashboard as per your needs. For example, you can configure a widget to display a graph with the top 10 applications with the most sessions in the last hour.

Click the refresh icon to update the dashboard or an individual widget. To change the automatic refresh interval, select an interval from the drop-down list, which ranges from 5 minutes up to 7 days. To add a widget to the Dashboard, drag the widgets from the palette or thumbnail container into the workspace. To delete a widget, click X icon in the title bar.

In addition, you can use the dashboard to:

- Navigate to the Devices page from the devices widgets by clicking the **More Details** link.
- Navigate to the Alarms page from devices most alarms widgets by clicking the **More Details** link.
- Navigate to the Events and Logs page from an event-based widget.

The dashboard page automatically adjusts the placement of the widgets to dynamically fit on the browser window without changing the order of the widgets. You can manually reorder the widgets using the drag and drop option. The widget can be reordered or moved by holding the top header section of the widget.

NOTE: If you are using Policy Enforcer and Sky ATP with Security Director, additional widgets are added to the dashboard. See *Policy Enforcer Dashboard Widgets* for those widget descriptions.

Starting in Junos Space Security Director Release 17.1, Application Top Application by Volume, IP Top Source IPs by Volume, IP Top Spams By Source IPs, Web Filtering Top Blocked Websites, Virus Top Blocked, and IP Top Source IPs by Sessions widgets are added.

Table 5: Widgets

Widget	Description
Devices Count By Platform	Displays device count grouped by platform.
Devices Count By OS	Displays device count grouped by operating system.
Device Count By Status	Displays device count grouped by the system status (Up/down).
Firewall Top Denies	Displays top requests denied by the firewall based on their source IP addresses, sorted by count.
Firewall Top Events	Displays top firewall events of the network traffic, sorted by count.
IPS Top Events	Displays top IPS events of the network traffic, sorted by count.
Applications most sessions	Displays the applications with the most sessions.
IP Top Destinations	Displays top destination IP addresses of the network traffic, sorted by count.
IP Top Sources	Displays top source IP addresses of the network traffic, sorted by count.
Devices Most CPU Usage	Displays devices with maximum CPU utilization, sorted by count.
Devices Most Memory Usage	Displays devices with maximum memory utilization, sorted by count.
Devices Most Storage	Displays devices with most storage usage, sorted by count.
Firewall Policy Rules with No Hits	Displays firewall policies with the most rules not hit, sorted by count.
Devices Most Bandwidth by Bytes	Displays devices consuming maximum bandwidth in bytes.
Zones Most Bandwidth by Bytes	Displays zones with maximum throughput rate in bytes, sorted by incoming and outgoing bytes.
Devices Most Dropped Packets	Displays firewall devices with maximum number of packet drops, sorted by count.
Zones Most Dropped Packets	Displays firewall zones with maximum number of packet drops, sorted by count.

Table 5: Widgets (continued)

Widget	Description
Devices Most Bandwidth by Packets	Devices with maximum throughput rate in packets, sorted by incoming and outgoing packets.
Zones Most Bandwidth by Packets	Displays zones with maximum throughput rate in packets, sorted by incoming and outgoing packets.
Devices Most Sessions	Displays devices with the most number of sessions, sorted by count.
Devices Most Alarms	Displays devices with maximum number of alarms, sorted by count.
Threat Map Virus	Displays world map showing total virus event count across countries.
Threat Map IPS	Displays world map showing total IPS event count across countries.
Application Top Application by Volume	Displays top applications based on volume or bandwidth.
IP Top Source IPs by Volume	Displays top source IP addresses of the network traffic by volume or bandwidth.
IP Top Spams By Source IPs	Displays top source IP addresses for spams.
Web Filtering Top Blocked Websites	Displays blocked websites, sorted by count.
Virus Top Blocked	Displays blocked viruses, sorted by count.
IP Top Source IPs by Sessions	Displays top source IP addresses of the network traffic by sessions.
NAT Top Source Translation Hits	Displays the Network Address Translation (NAT) rule names with most hits for source NAT.
NAT Top Destination Translation Hits	Displays the NAT rule names with most hits for destination NAT.

Policy Enforcer adds widgets to the dashboard that provide a summary of all gathered information on compromised content and hosts. Drag and drop widgets to add them to your dashboard. Mouse over a widget to refresh, remove, or edit the contents.

In addition, you can use the dashboard to:

- Navigate to the File Scanning page from the Top Scanned Files and Top Infected Files widgets by clicking the **More Details** link.
- Navigate to the Hosts page from the Top Compromised Hosts widget by clicking the **More Details** link.

- Navigate to the Command and Control Servers page from the C&C Server Malware Source Location widget.

NOTE: C&C and GeolIP filtering feeds are only available with the Cloud Feed or Premium license.

Table 6: Policy Enforcer Widgets

Widget	Definition
Top Malware Identified	A list of the top malware found based on the number of times the malware is detected over a period of time. Use the arrow to filter by different time frames.
Top Compromised Hosts	A list of the top compromised hosts based on their associated threat level and blocked status.
Top Infected File Types	A graph of the top infected file types by file extension. Examples: exe, pdf, ini, zip. Use the arrows to filter by threat level and time frame.
Top Infected File Categories	A graph of the top infected file categories. Examples: executables, archived files, libraries. Use the arrows to filter by threat level and time frame.
Top Scanned File Types	A graph of the top file types scanned for malware. Examples: exe, pdf, ini, zip. Use the arrows to filter by different time frames.
Top Scanned File Categories	A graph of the top file categories scanned for malware. Examples: executables, archived files, libraries. Use the arrows to filter by different time frames.
C&C Server and Malware Source	A color-coded map displaying the location of Command and Control servers or other malware sources. Click a location on the map to view the number of detected sources.

[Table 7 on page 27](#) provides the source of information for each widget type on dashboard.

Table 7: Information Source for the Widgets

Widget Type	Source
Firewall Top Events	syslog
Applications Most Sessions	syslog
IP Top Destinations	syslog
IP Top Sources	syslog

Table 7: Information Source for the Widgets (*continued*)

Widget Type	Source
Top Firewall Denies	syslog
IPS top events	syslog
Threatmap virus	syslog
Threatmap IPS	syslog
NAT Top Source Translation Hits	syslog
NAT Top Destination Translation Hits	syslog
Application Top Application by Volume	Application visibility
IP Top Source IPs by Volume	Source IP visibility
IP Top Spams By Source IPs	syslog
Web Filtering Top Blocked Websites	syslog
Virus Top Blocked	syslog
IP Top Source IPs by Sessions	Source IP visibility
Firewall policy: Rules with no hits	Firewall Rule Hit count
Devices Most CPU Usage	SRX device polling
Devices Most Memory Usage	SRX device polling
Devices Most Sessions	SRX device polling
Devices Most Bandwidth By Bytes	SRX device polling
Zones Most Bandwidth By Bytes	SRX device polling
Devices Most Dropped Packets	SRX device polling
Zones Most Dropped Packets	SRX device polling
Devices Most Bandwidth By Packets	SRX device polling

Table 7: Information Source for the Widgets (*continued*)

Widget Type	Source
Zones Most Bandwidth By Packets	SRX device polling
Devices Most Storage	SRX device polling
Device Count By Platform	Space Platform/ SD Devices
Device Count By OS	Space Platform/ SD Devices
Device Count By Status	Space Platform/ SD Devices

NOTE: In Junos Space Security Director Release 16.2R1, the following widgets display the device statistics for the root device and not for the logical systems (LSYS):

- Devices Most CPU Usage
- Devices Most Memory Usage
- Devices Most Sessions
- Devices Most Bandwidth by Bytes
- Zones Most Bandwidth by Bytes
- Devices Most Dropped Packets
- Zones Most Dropped Packets
- Devices Most Bandwidth by Packets
- Zones Most Bandwidth by Packets
- Devices Most Storage

Understanding Role-Based Access Control for the Dashboard

Role-based access control (RBAC) has the following impact on the dashboard:

- You must have Security Analyst or Security Architect role or have permissions equivalent to that role to access the dashboard.
- You must have the required permissions to edit dashboard widgets. The user role under **Administration** > **Users & Roles** must have **Event Viewer** > **Edit Dashboard** option enabled to edit the settings on dashboard widgets.

- You must have **Administration > Users & Roles > Event Viewer > View Device Logs** option enabled to view or read logs.

Release History Table

Release	Description
17.1	Starting in Junos Space Security Director Release 17.1, Application Top Application by Volume, IP Top Source IPs by Volume, IP Top Spams By Source IPs, Web Filtering Top Blocked Websites, Virus Top Blocked, and IP Top Source IPs by Sessions widgets are added.
16.2	In Junos Space Security Director Release 16.2R1, the following widgets display the device statistics for the root device and not for the logical systems (LSYS):

Events and Logs Overview

Use the Events and Logs page to get an overall, high-level view of your network environment. You can view abnormal events, attacks, viruses, or worms when log data is correlated and analyzed.

This page provides administrators with an advanced filtering mechanism and provides visibility into actual events collected by the Log Collector. Using the time-frame slider, you can instantly focus on areas of unusual activity by dragging the time slider to the area of interest to you. The slider and the Custom button

under Time Range remain at the top of each tab. Users select the time range, and then they can decide how to view the data, using the summary view or detail view tabs.

To access the Event Viewer page select **Monitor > Events & Logs > All Events**.

Events & Logs—Summary View

Click Summary View for a brief summary of all the events in your network. At the center of the page is critical information, including total number of events, viruses found, total number of interfaces that are down, number of attacks, CPU spikes, and system reboots. This data is refreshed automatically based on the selected time range. At the bottom of the page is a swim-lane view of different events that are happening at a specific time. The events include firewall, Web filtering, VPN, content filtering, antispam, antivirus, IPS, Sky ATP, Screen, and Aptrack. Each event is color-coded, with darker shades representing a higher level of activity. Each tabs provide deep information like type, and number of events occurring at that specific time.

See [Table 8 on page 34](#) the descriptions of the widgets in this view.

Table 8: Events and Logs Summary View Widgets

Widget	Description
Total Events	Total number of all the events that includes firewall, webfiltering, IPS, IPSec, content filtering, antispam, and antivirus events.
Virus Instances	Total number of virtual instances running in the system.
Attacks	Total number of attacks on the firewall.
Interface Down	Total number of interfaces that are down.
CPU Spikes	Total number of times a CPU utilization spike has occurred.
Reboots	Total number of system reboots.
Sessions	Total number of sessions established through firewall.

Events & Logs—Detail View

Click **Detail View** for comprehensive details of events in a tabular format that includes sortable columns. You can sort the events using the Group by option. For example, you can sort the events based on severity. The table includes information such as the rule that caused the event, severity for the event, event ID, traffic information, and how and when the event was detected.

Select **Export to CSV** option from the grid settings pane to export and download the log data in CSV file.

Advanced Search

Starting in Junos Space Security Director Release 16.1R1, you can perform advanced search of all events using the text field present above the tabular column. It includes the logical operators as part of the filter string. Enter the search string in the text field and based on your input, a list of items from the filter context menu is displayed. You can select a value from the list and then select a valid operator based on which you want to perform the advanced search operation. Press Enter to provide AND operator and comma for OR operator. After you have entered the search string, press Enter to display the search result in the tabular column below.

To delete the search string in the text field, click X icon.

Following are some of the examples for event log filters:

- Specific events originating from or landing within United States

Source Country = United States OR Destination Country = United States AND Event Name = IDP_ATTACK_LOG_EVENT, IDP_ATTACK_LOG_EVENT_LS, IDP_APPDDOS_APP_ATTACK_EVENT_LS, IDP_APPDDOS_APP_STATE_EVENT, IDP_APPDDOS_APP_STATE_EVENT_LS, AV_VIRUS_DETECTED_MT, AV_VIRUS_DETECTED, ANTISPAM_SPAM_DETECTED_MT, ANTISPAM_SPAM_DETECTED_MT_LS, FWAUTH_FTP_USER_AUTH_FAIL, FWAUTH_FTP_USER_AUTH_FAIL_LS, FWAUTH_HTTP_USER_AUTH_FAIL, FWAUTH_HTTP_USER_AUTH_FAIL_LS, FWAUTH_TELNET_USER_AUTH_FAIL, FWAUTH_TELNET_USER_AUTH_FAIL_LS, FWAUTH_WEBAUTH_FAIL, FWAUTH_WEBAUTH_FAIL_LS

- User wants to filter all RT flow sessions originating from IPs in specific countries and landing on IPs in specific countries

Event Name = RT_FLOW_SESSION_CREATE, RT_FLOW_SESSION_CLOSE AND Source IP = 177.1.1.1, 220.194.0.150, 14.1.1.2, 196.194.56.4 AND Destination IP = 255.255.255.255, 10.207.99.75, 10.207.99.72, 223.165.27.13 AND Source Country = Brazil, United States, China, Russia, Algeria AND Destination Country = Germany, India, United States

- Traffic between zone pairs for policy – IDP2

Source Zone = trust AND Destination Zone = untrust, internal AND Policy Name = IDP2

- UTM logs coming from specific source country, destination country, source IPs with or without specific destination IPs

Event Category = antispam, antivirus, contentfilter, webfilter AND Source Country = Australia AND Destination Country = Turkey, United States, Australia AND Source IP = 1.0.0.0, 1.1.1.3 OR Destination IP = 74.125.224.47, 5.56.17.61

- Events with specific sources IPs or events hitting http, tftp, http, and unknown applications coming from host DC-SRX1400-1 or VSRX-75.

Application = tftp, ftp, http, unknow OR Source IP = 192.168.34.10, 192.168.1.26 AND Hostname = dc-srx1400-1, vsrx-75

See [Table 9 on page 36](#) for field descriptions.

Table 9: Events and Logs Detail Columns

Field	Description
Log Generated Time	The time when the log was generated on the SRX Series device.
Log Received Time	The time when the log was received on the log collector.
Event Name	The event name of the log
Source Country	The source country name.
Source IP	The source IP address from where the event occurred.
Destination Country	Destination country name from where the event occurred.
Destination IP	The destination IP address of the event.
Source Port	The source port of the event.
Destination Port	The destination port of the event.
Description	The description of the log.
Attack name	Attack name of the log: Trojan, worm, virus, and so on.
Threat Severity	The severity level of the threat.
Policy Name	The policy name in the log.
UTM category or Virus Name	The UTM category of the log.
URL	Accessed URL name that triggered the event.
Event category	The event category of the log.
User Name	The username of the log.
Action	Action taken for the event: warning, allow, and block.
Log Source	The IP address of the log source.
Application	The application name from which the events or logs are generated
Hostname	The host name in the log.

Table 9: Events and Logs Detail Columns (*continued*)

Field	Description
Service Name	The name of the application service. For example, FTP, HTTP, SSH, and so on.
Nested Application	The nested application in the log.
Source Zone	The source zone of the log.
Destination Zone	The destination zone of the log.
Protocol ID	The protocol ID in the log.
Roles	The role name associated with the log.
Reason	The reason for the log generation. For example, a connection tear down may have an associated reason such as authentication failed.
NAT Source Port	The translated source port.
NAT Destination Port	The translated destination port.
NAT Source Rule Name	The NAT source rule name.
NAT Destination Rule Name	The NAT destination rule name.
NAT Source IP	The translated (or natted) source IP address. It can contain IPv4 or IPv6 addresses.
NAT Destination IP	The translated (also called natted) destination IP address.
Traffic Session ID	The traffic session ID of the log.
Path Name	The path name of the log.
Logical system Name	The name of the logical system.
Rule Name	The name of the rule.
Profile Name	The name of the All events profile that triggered the event.
Client Hostname	Hostname of the client.

Table 9: Events and Logs Detail Columns (*continued*)

Field	Description
Malware Info	Information of the malware.

Role-Based Access Control for Event Viewer

Role-Based Access Control (RBAC) has the following impact on the Event Viewer:

- You must have Security Analyst or Security Architect or have permissions equivalent to that role to access the event viewer.
- You cannot view event logs created in other domains. However, a super user or any user with an appropriate role who can access a global domain can view logs in a subdomain, if a subdomain is created with visibility to the parent domain.
- You can only view logs from the devices that you can access and that belong to your domain.
- You can only view, not edit, a policy if you do not have edit permissions.
- The user role under **Administration > Users & Roles** must have **Event Viewer > View Device Logs** option is enabled to view or read logs.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1R1, you can perform advanced search of all events using the text field present above the tabular column.

Creating Alerts

You can use the All Events page to create an alert.

To create an alert:

1. Select **Monitor > Events & Logs > All Events**.
2. Click **Detail View**.
3. Select data criteria to create an alert:
 - Select filter string from the drop-down list.
 - Select data aggregation from the **Group-By** drop-down list.

You can also use existing filters by selecting **Filters > Show Saved Filters**.

4. Click **Save > Create Alert**.

The Create Alert Wizard appears.

5. Complete the configuration according to the guidelines provided in [Table 10 on page 39](#).
6. Click **Finish**.

The Create Alert Wizard shows a summary of your configuration changes. You can edit the individual configuration parameters by clicking **Edit**.

7. Click **OK** to close the window.

Table 10: Create Alert Wizard Settings

Setting	Guideline
<i>General</i>	
Alert Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Alert Description	Enter a description for the alerts; maximum length is 1024 characters.
Alert Type	Displays the type of alert that is system based.
Status	Select the Active check box to view only the active alerts.

Table 10: Create Alert Wizard Settings (*continued*)

Setting	Guideline
Severity	Select the severity level of the alert: Info, minor, major, critical.
<i>Data Criteria</i>	
Trigger	Specify the data criteria based on the Time Period, Group By, and Filter By options. Filtered data only displays the subset of data that meets the criteria that you specify. Enter the event threshold value between 1- 1,000,000,000.
Time Span	Starting in Junos Space Security Director Release 16.1, you can specify the duration for triggering an alert. <ul style="list-style-type: none"> • Minutes • Hours The default duration is 30 minutes and the maximum duration is 24 hours.
<i>E-Mail</i>	
Recipients	Select or enter valid usernames or e-mail addresses of the recipients to receive alert notifications.
Comments	Enter comments for the alert notification e-mail.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, you can specify the duration for triggering an alert.

Creating Reports

You can create a report from the Event Viewer.

To create a report:

1. Select **Monitor > Events & Logs**. Note that every report must have an aggregation point.
2. Select a Group By option to create a report.
3. Select a filter from Filters > Show Saved Filters
4. Select **Save > Create Report**.
5. Complete the configuration according to the guidelines provided in the [Table 11 on page 41](#).
6. Click **Save > Create Report**.
7. Click **Finish**.

Table 11: Report Settings

Settings	Guidelines
General Information	
Report Name	Enter a unique name for the report definition that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters.
Description	Enter a description for the report definition; maximum length is 1024 characters.
Content	
Use Data Criteria from Filters	<p>The data criteria for the report is displayed.</p> <p>The details displayed are:</p> <ul style="list-style-type: none"> • Filter String—Selected filter string. • Group By—Selected group by option. • Time Span—Duration for which the data is displayed.
Schedule	

Table 11: Report Settings (*continued*)

Settings	Guidelines
Add Schedule	<p>Select the type of report schedule that you want to use:</p> <ul style="list-style-type: none"> • Run now–Select this option to schedule and publish the configuration at the current time. • Schedule at a later time–Select this option if you want to schedule and publish the configuration at a later time. <p>Select the recurring schedule for report generation. The available options are:</p> <ul style="list-style-type: none"> • Repeat–Select this option to generate the report on an hourly, daily, weekly, monthly, or yearly basis. • Every–Select the number of days, weeks, or months for which the recurring report will be generated. • Ends–Select the end date and end time for the report.
Email	
Email Recipients	<p>Add Email Recipients</p> <ul style="list-style-type: none"> • Recipients- Enter or select the e-mail addresses of the recipients. By default, you can search by first name and select registered users. You can also type in external email addresses. • Subject- Enter the subject for the e-mail notification. • Comment- Enter the comments for the e-mail notification. <p>NOTE: The reports are not sent if a specified recipient does not have permission for a device or domain included in the report configuration when the report is generated.</p>

[Using the Detailed Log View | 47](#)

Creating Filters

Filters are used to search logs and view information about filter condition, time, or fields in the logs. You can configure basic and advanced filters to match the filtering conditions. You can either load existing filters or define a new filter. A filter allows you to enter specific information that must be displayed on the

Event Viewer page; for example, the columns in the Event Viewer table, the time range, and the aggregation point. When you change an existing filter or create a new filter, the Event Viewer table is updated automatically. If filters contain time details, the time range in Event Viewer is updated with the time specified in the filter.

Filters provide:

- Quick access to critical information—If you are a firewall administrator, you might have to regularly deny traffic from a specific application or a specific set of addresses. You might also have to allow or deny specific application access to some users. To achieve these conditions, you must set user search criteria, scan through the firewall logs that match that criteria, and display the matching logs.
- Filter sharing among users—Other users in your domain can use the filters you create without modifying or deleting the filters.
- Filter usage across multiple functional areas—Filters can be used across multiple functional areas such as the Event Viewer, dashboard, alerts, and reports.

To create an Event Viewer filter:

1. Select **Monitor > Events & Logs**.

2. Click **Detail View**.

3. Click the filter text field.

The filter keys available are displayed alphabetically in a drop-down list.

4. Type the exact key in the filter text field, or select the key from the drop-down key list.

The key appears in the filter bar. While typing in the values, you are prompted with suggestions in the drop-down list whenever possible.

For example: EventName =

5. Continue to add filter expressions *<key>space <operator> space <value>*.

The key appears, along with the value combination in the filter bar.

For example: EventName = LOGIN_FAILED

6. Repeat the Step 4 and Step 5 to add additional filter expressions. Press Enter to provide AND operator and comma for OR operator.

The available filter keys are displayed alphabetically in the drop-down list.

For example: EventName = LOGIN_FAILED AND SrcIP =

7. Type in the required IP address.

For example: EventName = LOGIN_FAILED AND SrcIP = 192.168.45.350

The term operator AND/OR is displayed in the filter bar to add a different key. Starting in Junos Space Security Director Release 16.1, the term operator OR is displayed.

8. Click **Save > Save Filter**.

9. Click **OK**.

The event logs for EventName = LOGIN_FAILED AND SrcIP = 192.168.45.350 are displayed.

For examples on event log filters, see Advanced Search section in [“Events and Logs Overview”](#) on page 33.

NOTE: The filters that you have typed will appear in the filter history until the next session.

Using Filters

Filters are used to search logs and view information about filter condition, time, or fields in the logs. You can configure basic and advanced filters to match the filtering conditions. You can either load existing filters or define a new filter. A filter allows you to enter specific information that must be displayed on the Event Viewer page; for example, the columns in the Event Viewer table, the type of graph, the time period, and the aggregation point. When you change an existing filter or create a new filter, the Event Viewer table and event graph are updated automatically. If filters contain time details, the time control in Event Viewer is updated with the time specified in the filter.

You can edit, save, delete, or search filters on the Event Viewer page. To open the filter options, select **Monitor > Events & Logs > Filters > Show Saved Filters** on the Event Viewer page.

You can perform the following tasks:

1. Create Filters
2. Search Filters
3. Edit Filters
4. Save Filters
5. Delete Filters

Editing Event Viewer Filters

To edit an Event Viewer filter:

1. Select a filter.

The filter details are displayed in the filter bar.

2. Edit the filter string.

3. Click **Save**.

The filter is saved and the database is updated.

Viewing Saved Filters

You can filter the results to display only event logs matching certain criteria.

1. Select **Monitor > Events & Logs**
2. Select **Filters > Show Saved Filters** to view the saved filters.

The following are the default filters that are available:

- Top Web Apps
- Top Applications Blocked
- Top URL's Detected
- Top URL's Blocked
- Top Viruses Detected
- Top Spam Sources
- Top Services Blocked

- Top Unidentified Applications
- Top Screen Attackers
- Top Screen Victims
- Top Screen Hits
- Top Firewall Deny Sources
- Top Firewall Deny Destinations
- Top Firewall Service Deny
- Top Firewall Events
- Top FW Denies
- Top IPS Attack Detected
- Top IPS Attack Blocked
- Top IPS Attacks by Severity
- Top IPS Attack Sources
- Top IPS Attack Destinations
- Top IPS Events
- Top Webfiltering URLs Detected
- Top Source IPs
- Top Destination IPs

Deleting Event Viewer Filters

To delete an Event Viewer filter:

1. Select **Monitor > Events & Logs > Filters > Show Saved Filters**.

The View/Load Filters window appears.

2. Select the filter

3. On the top right corner of the window, click the delete button (X).

The delete confirmation window displays the message. Do you want to delete the selected filter?

4. Click **Yes** to confirm the deletion.

The selected filter is deleted.

Events and Logs-Firewall

IN THIS CHAPTER

- Firewall Events and Logs Overview | 57

Firewall Events and Logs Overview

Use the Firewall Events page to view information about security events based on firewall policies. Analyzing firewall logs yields useful security management information, such as attempts to breach your network and observing the inherent characteristics of your traffic in real time. Using the time-frame slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the Custom button to set a custom time range.

There are two ways to view your data. You can select either the Summary tab or the Details tab.

Firewall Events—Summary View

Click **Summary View** for a brief summary of all the firewall events in your network. The data presented in the line graph (also known as swim lanes) is refreshed automatically based on the selected time range. The line graph shows light blue lanes that represent all firewall events and dark blue lanes represent blocked firewall events.

Below the swim lanes are widgets displaying critical information such as top sources, top destinations, top users, and top reporting devices. See the Firewall Events Summary Widgets for the descriptions of the elements appearing in this view.

See [Table 12 on page 57](#) for descriptions of the widgets in this view.

Table 12: Widgets in Summary View

Widget	Description
Top Sources	Top source IP addresses of the network traffic; sorted by event count.
Top Destinations	Top destination IP addresses of the network traffic; sorted by event count.

Table 12: Widgets in Summary View (*continued*)

Widget	Description
Top Users	Top users of the network traffic; sorted by event count.
Top Reporting Devices	Top reporting devices in the network; sorted by event count.

Firewall Events—Details View

Click the Details View for comprehensive details of events in a tabular format that includes sortable columns. The table includes information such as the rule that caused the event, severity for the event, event ID, traffic information, and how and when the event was detected.

See [Table 13 on page 58](#) for descriptions of the columns in this view.

Table 13: Columns in Detail View

Column	Description
Time	The time when the log was received.
Event Name	The event name of the log.
Source Country	Source country name from where the event originated.
Source IP	The source IP address from where the event occurred.
Destination Country	The destination country name from where the event occurred.
Destination IP	The destination IP address of the event.
Source Port	The source port of the event.
Destination Port	Destination port of the event.
Description	The description of the log.
Policy name	Policy name in the log.
User Name	The username of the log.
Action	Action taken for the event: warning, allow, and block.
Log Source	IP address of the log source (IPv4 or IPv6).

Table 13: Columns in Detail View *(continued)*

Column	Description
Application	The application name from which the events or logs are generated.
Hostname	The host name in the log.
Service Name	The name of the application service. For example, FTP, HTTP, SSH, and so on.
Nested Application	The nested application in the log.
Source Zone	User traffic received from the zone.
Destination Zone	The destination zone of the log.
Protocol ID	The protocol ID in the log.
Roles	Role names associated with the event.
NAT Source Port	The translated source port.
NAT Destination Port	The translated destination port.
NAT Source Rule Name	The NAT source rule name.
NAT Destination Rule Name	The NAT destination rule name.
NAT Source IP	The translated (or natted) source IP address. It can contain IPv4 or IPv6 addresses.
NAT Destination IP	The translated (also called natted) destination IP address.
Traffic Session ID	The traffic session ID of the log.
Rule Name	The rule name of the log.

Events and Logs-Web Filtering

IN THIS CHAPTER

- [Web Filtering Events and Log Overview | 61](#)

Web Filtering Events and Log Overview

Use this page to view information about security events based on Web filtering policies. Web filtering allows you to permit or block access to specific websites by URL or by URL category using cloud-based lookups, a local database, or an external Websense server. Analyzing Web filtering logs yields useful security management information such as users detected accessing restricted URLs and actions taken by the system. Using the time-frame slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the Custom button to set a custom time range.

Web Filtering Events—Summary View

Click **Summary View** for a brief summary of all the Web filtering events in your network. The top of the page has a swim lane graph of all the Web filtering events against the blocked events.

You can use the widgets at the bottom of the page to view critical information such as top URLs blocked, top matched profiles, top sources, and top destinations. See [Table 14 on page 61](#) for descriptions of the widgets in this view.

Table 14: Widgets in Summary View

Widget	Description
Top URLs blocked	URL names that are blocked; sorted by event count.
Top Matched Profiles	Web filtering profile names; sorted by event count.
Top Sources	Top source IP addresses of the network traffic; sorted by event count.
Top Destinations	Top destination IP addresses of the network traffic; sorted by event count.

Web Filtering Events—Detail View

Click **Detail View** for comprehensive details of events in a tabular format that includes sortable columns. You can aggregate the events using the Group by option. For example, you can group the events based on source country. The table includes information such as the event name, UTM category, source IP address, source country and so on.

See [Table 15 on page 62](#) for descriptions of the columns in this view.

Table 15: Columns in Detail View

Column	Description
Time	Time when the event occurred.
Event Name	Event name of the log.
Source Country	Source country name from where the event originated.
Source IP	Source IP address from where the event occurred (IPv4 or IPv6).
Destination Country	Destination country name from where the event occurred.
Destination IP	Destination IP address of the event (IPv4 or IPv6).
Source Port	Source port of the event.
Destination Port	Destination port of the event.
Description	Description of the log.
UTM category or Virus Name	UTM category of the log: enhanced, local, and redirect.
URL	Accessed URL name that triggered the event.
Action	Action taken for the event: warning, allow, and block.
Log Source	IP address of the log source (IPv4 or IPv6).
Host Name	Hostname in the log.
Source Zone	User traffic received from the zone.
Roles	Role names associated with the event.
Reason	Reason for the log generation. For example, unrestricted access.

Table 15: Columns in Detail View (*continued*)

Column	Description
Path Name	The path name of the log.
Profile Name	Name of the Web filtering profile that triggered the event.

Events and Logs-VPN

IN THIS CHAPTER

- [VPN Events and Logs Overview | 64](#)

VPN Events and Logs Overview

Use this page to view information about security events based on IPSec VPN policies. The event viewer provides a view of all IPsec VPN events.

Using the time-frame slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the Custom button to set a custom time range.

There are two ways to view your data. You can select either the summary view or the detail view.

VPN Events—Summary View

Click Summary View for a brief summary of all the VPN events in your network. The top of the page has a swim lane graph of all the VPN events. You can use the widgets at the bottom of the page to view critical information such as top sources, top destinations, and top reporting devices. See [Table 16 on page 64](#) for descriptions of the widgets in this view.

Table 16: Widgets in Summary View

Widget	Description
Top Sources	Top source IP addresses of the network traffic; sorted by event count.
Top Destinations	Top destination IP addresses of the network traffic; sorted by event count.
Top Reporting Devices	Top reporting device IP addresses; sorted by event count.

VPN Events—Detail View

Click Detail View for comprehensive details of events in a tabular format that includes sortable columns. You can aggregate the events using the Group by option. For example, you can group the events based

on source country. The table includes information such as the event name, log source, host name, source country, and so on.

See [Table 17 on page 65](#) for descriptions of columns in this view.

Table 17: Columns in Detail View

Column	Description
Time	Time when the event occurred.
Event Name	Event name of the log.
Source Country	Source country name where the event originated.
Destination Country	Destination country name where the event occurred.
Destination Port	Destination port of the event.
Description	Description of the log.
Log Source	IP address of the log source (IPv4 or IPv6).
Host Name	Hostname in the log.
Rule Name	Name of the antivirus profile that triggered the event.

Events and Logs-Content Filtering

IN THIS CHAPTER

- [Content Filtering Events and Logs Overview](#) | 66

Content Filtering Events and Logs Overview

Use this page to view information about security events based on Content filtering policies. The event viewer provides a view of all content filtering events and how the events are handled by content filter. This page can be used to view traffic on the network in real time or as a debugging tool to view how content filtering is operating.

Content filtering provides basic data loss prevention functionality. Content filtering screens traffic based on MIME type, file extension, protocol commands, and embedded object type. It either permits or blocks specific commands or extensions on a protocol-by-protocol basis.

Using the time-frame slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the Custom button to set a custom time range.

There are two ways to view your data. You can select either the summary view or the detail view.

Content Filtering Events—Summary View

Click **Summary View** for a brief summary of all the content filtering events in your network. The top of the page has a swim lane graph of all the content filtering events against the blocked events. You can use the widgets at the bottom of the page to view critical information such as top blocked protocol commands, top reasons, and top sources. See [Table 18 on page 66](#) for descriptions of the widgets in this view.

Table 18: Widgets in Summary View

Widget	Description
Top Blocked Protocol commands	Top command names or file extensions blocked on a protocol-byprotocol basis.

Table 18: Widgets in Summary View (*continued*)

Widget	Description
Top Reasons	Top reasons for blocking the content. For example: Inappropriate or harmful communication.
Top Sources	Top source IP addresses of the network traffic; sorted by event count.

Content Filtering Events—Detail View

Click **Detail View** for comprehensive details of events in a tabular format that includes sortable columns. You can aggregate the events using the Group by option. For example, you can group the events based on source country. The table includes information such as the event name, UTM category, source IP address, source country, and so on.

See [Table 19 on page 67](#) for descriptions of columns in this view.

Table 19: Columns in Detail View

Column	Description
Time	Time when the event occurred.
Event Name	Event name of the log.
Source Country	Source country name from where the event originated.
Source IP	Source IP address from where the event occurred (IPv4 or IPv6).
Description	Description of the log.
UTM Category or Virus Name	UTM category of the log: enhanced, local, and redirect.
URL	Accessed URL name that triggered the event.
Argument	Type of traffic. For example, ftp and http.
Action	Action taken for the event: warning, allow, and block.
Log Source	IP address of the log source (IPv4 or IPv6).
Host Name	Hostname in the log.
Source Zone	User traffic received from the zone.

Table 19: Columns in Detail View *(continued)*

Column	Description
Roles	Role names associated with the event.
Reason	Reason for the log generation. For example, unrestricted access.

Events and Logs-Antispam

IN THIS CHAPTER

- [Antispam Events and Logs Overview | 69](#)

Antispam Events and Logs Overview

Use this page to view information about security events based on antispam policies. The event viewer provides a view of all antispam events and the action taken by the antispam scanner.

The antispam scanner inspects and block spam by scanning inbound and outbound SMTP e-mail traffic. The filtering can be server-based using an external spam block list server or local-based using local lists (blacklists and whitelists) for matching.

Using the time-frame slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the Custom button to set a custom time range.

There are two ways to view your data. You can select either the summary view or the detail view.

Antispam Events—Summary View

Click Summary View for a brief summary of all the antispam events in your network. The top of the page has a swim lane graph of all antispam events.

You can use the widget at the bottom of the page to view source IP addresses of the network traffic; sorted by event count.

Antispam Events—Detail View

Click Detail View for comprehensive details of events in a tabular format that includes sortable columns. You can aggregate the events using the Group by option. For example, you can group the events based on source country. The table includes information such as the event name, UTM category, source IP address, source country, and so on.

See [Table 20 on page 70](#) for descriptions of columns in this view.

Table 20: Columns in Detail View

Column	Description
Time	Time when the event occurred.
Event Name	Event name of the log.
Source Country	Source country name from where the event originated.
Source IP	Source IP address from where the event occurred (IPv4 or IPv6).
Description	Description of the log.
UTM Category or Virus Name	UTM category of the log: enhanced, local, and redirect.
URL	Accessed URL name that triggered the event.
Action	Action taken for the event: warning, allow, and block.
Log Source	IP address of the log source (IPv4 or IPv6).
Host Name	Hostname in the log.
Source Zone	User traffic received from the zone.
Roles	Role names associated with the event.
Reason	Reason for the log generation. For example, unrestricted access.

Events and Logs-Antivirus

IN THIS CHAPTER

- [Antivirus Events and Logs Overview | 71](#)

Antivirus Events and Logs Overview

Use this page to view information about security events based on antivirus policies. The event viewer provides a view of all antivirus events and the action taken by the virus scanner.

The antivirus scanner inspects files transmitted over several protocols to determine if the files exchanged are malicious (for example, viruses, Trojans, rootkits, and worms).

Using the time-frame slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the Custom button to set a custom time range.

There are two ways to view your data. You can select either the summary view or the detail view.

Antivirus Events—Summary View

Click **Summary View** for a brief summary of all the antivirus events in your network. The top of the page has a swim lane graph of all the antivirus events against the blocked events. You can use the widgets at the bottom of the page to view critical information such as top blocked protocol commands, top reasons, and top sources. See [Table 21 on page 71](#) for descriptions of the widgets in this view.

Table 21: Widgets in Summary View

Widget	Description
Top Sources	Top source IP addresses of the network traffic; sorted by event count.
Top Destinations	Top destination IP addresses of the network traffic; sorted by event count.
Top Reporting/Attacked Devices	Top reporting/attacked device IP addresses; sorted by event count.
Top Viruses	Top virus names detected; sorted by event count.

Table 21: Widgets in Summary View (*continued*)

Widget	Description
Top Source Countries	Top source country names where the events originated; sorted by event count.

Events and Logs-IPS

IN THIS CHAPTER

- [IPS Events and Logs Overview | 74](#)

IPS Events and Logs Overview

Use the IPS Events page to view information about security events based on IPS policies. Analyzing IPS logs yields useful security management information, such as abnormal events, attacks, viruses, or worms.

Using the time-frame slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the custom button to set a custom time range.

There are two ways to view your data. You can select either the summary view or the detail view.

IPS Events—Summary View

Click **Summary View** for a brief summary of all the IPS events in your network. The data presented in the area graph is refreshed automatically based on the selected time range.

You can use widgets to view critical information such as IPS severities, top sources, top destinations, top reporting devices, top IPS attacks, top source countries, and top destination countries. See [Table 23 on page 74](#) for descriptions of the widgets in this view.

Table 23: IPS Events Summary View Widgets

Widget	Description
IPS Severities	IPS severities of the events based on the severity level: high, medium, low.
Top Sources	Top source IP addresses of the network traffic; sorted by the number of event occurrences.
Top Destinations	Top destination IP addresses of the network traffic; sorted by the number of event occurrences.

Table 23: IPS Events Summary View Widgets (*continued*)

Widget	Description
Top Reporting/Attacked Devices	Top devices that are attacked by IPS events; sorted by the number of times users are active on the network.
Top IPS attacks	Top IPS attacks in the network traffic; sorted by the times devices are attacked.
Top Source Countries	Top source countries from where the event source originated; sorted by the number of IP addresses.
Top Destination Countries	Top destination countries targeted for the attack; sorted by the number of destination IP addresses.

IPS Events—Detail View

Click **Detail View** for comprehensive details of events in a tabular format that includes sortable columns. You can sort the events using the Group by option. For example, you can sort the events based on severity. The table includes information such as the rule that caused the event, severity for the event, event ID, traffic information, and how and when the event was detected.

NOTE: Packet capture is applicable for IPS packets. See [“Packet Capture Overview” on page 188](#).

See [Table 24 on page 75](#) for descriptions of columns in this view.

Table 24: IPS Events Detail Columns

Column	Description
Time	The time when the log was received.
Event Name	Event name of the log.
Source Country	Source country name from where the event originated.
Source IP	Source IP address from where the event occurred.
Destination Country	Destination country name from where the event occurred.
Destination IP	Destination IP address of the event.
Source Port	Source port of the event.

Table 24: IPS Events Detail Columns (*continued*)

Column	Description
Destination Port	Destination port of the event.
Description	Description of the log.
Attack name	Attack name of the log: Trojan, worm, virus, and so on.
Threat Severity	The threat severity of the event.
Policy Name	The policy name in the log.
Action	Action taken for the event: warning, allow, and block.
Log Source	The IP address of the log source.
Application	The application name from which the events or logs are generated.
Hostname	The host name in the log.
Service Name	The name of the application service. For example, FTP, HTTP, SSH, and so on.
Nested Application	Nested application name in the log.
Source Zone	The source zone of the log.
Destination Zone	The destination zone of the log.
Protocol ID	The protocol ID in the log.
NAT Source Port	Translated source port.
NAT Destination Port	Translated destination port
NAT Source IP	NAT source IP address of the log.
NAT Destination IP	NAT destination IP address of the log.
Rule Name	Name of the rule.

Screen Events and Logs Overview

You can use the Screen Events page to view the information about security events based on screen profiles. Analyzing screen logs yields information such as attack name, action taken, source of an attack, and destination of an attack.

Using the Time Range slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the Custom button to set a custom time range.

There are two ways to view your data. You can select either the summary view or the detail view.

Screen Events—Summary View

Click **Summary View** for a brief summary of all Screen events in your network. The data presented in the area graph is refreshed automatically based on the selected time range.

You can use widgets to view critical information such as top sources, top destinations, top source countries, and top destination countries. See [Table 25 on page 78](#) for descriptions of the widgets in this view.

Table 25: Screen Events Summary View Widgets

Widget	Description
Top Sources	Top source IP addresses of the network traffic; sorted by the number of event occurrences.
Top Destinations	Top destination IP addresses of the network traffic; sorted by the number of event occurrences.
Top Source Countries	Top source countries from where the event source originated; sorted by the number of IP addresses.

Table 25: Screen Events Summary View Widgets (*continued*)

Widget	Description
Top Destination Countries	Top destination countries targeted for the attack; sorted by the number of destination IP addresses.

Screen Events—Detail View

Click **Detail View** for comprehensive details of all screen events in a tabular format that includes sortable columns. You can sort the events using the Group by option. For example, you can sort the events based on threat severity. The table includes information such as the event name, source country, source IP, destination country, attack name, and so on.

See [Table 26 on page 79](#) for descriptions of columns in this view.

Table 26: Screen Events Detail View Columns

Column	Description
Log Generated Time	The time when the log was received.
Event Name	Event name of the log.
Source Country	Source country name from where the event originated.
Source IP	Source IP address from where the event occurred.
Destination Country	Destination country name from where the event occurred.
Attack Name	Attack name of the log.
Destination IP	Destination IP address of the event.
Source Port	Source port of the event.
Destination Port	Destination port of the event.
Description	Description of the log.
Threat Severity	The threat severity of the event.
Policy Name	The policy name in the log.
Action	Action taken for the event: warning, allow, and block.

Table 26: Screen Events Detail View Columns *(continued)*

Column	Description
Log Source	The IP address of the log source.
Hostname	The hostname in the log.
Source Zone	The source zone of the log.
Destination Zone	The destination zone of the log.

Events and Logs-Sky ATP

IN THIS CHAPTER

- Sky ATP Events and Logs Overview | 81

Sky ATP Events and Logs Overview

You can use the Sky ATP Events page to view the information about security events based on Sky ATP policies. Analyzing the Sky ATP logs yields information such as malware name, action taken, infected host, source of an attack, and destination of an attack.

Using the Time Range slider, you can quickly focus on the area of activity that you are most interested in. Once the time range is selected, all of the data presented in your view is refreshed automatically. You can also use the Custom button to set a custom time range.

There are two ways to view your data. You can select either the summary view or the detail view.

Sky ATP Events—Summary View

Click **Summary View** for a brief summary of all the Sky ATP events in your network. The data presented in the area graph is refreshed automatically based on the selected time range.

You can use widgets to view critical information, such as top infected hosts, top malware, top source countries, and top destination countries. See [Table 27 on page 81](#) for descriptions of the widgets in this view.

Table 27: Sky ATP Events Summary View Widgets

Widgets	Description
Top Infected Hosts	Top infected hosts based on their associated threat level and blocked status.
Top Malware	Top malware found based on the number of times the malware is detected over a period of time.
Top Source Countries	Top source countries from where the event source originated; sorted by the number of IP addresses.

Table 27: Sky ATP Events Summary View Widgets (*continued*)

Widgets	Description
Top destination countries	Top destination countries targeted for the attack; sorted by the number of destination IP addresses.

Sky ATP Events—Detail View

Click **Detail View** for comprehensive details of all Sky ATP events in a tabular format that includes sortable columns. You can sort the events using the Group by option. For example, you can sort the events based on threat severity. The table includes information such as the event name, source country, source IP, destination country, malware information, and so on.

See [Table 28 on page 82](#) for descriptions of columns in this view.

Table 28: Sky ATP Events Detail View Columns

Column	Description
Log Generated Time	The time when the log was received.
Event Name	Event name of the log.
Source Country	Source country name from where the event originated.
Source IP	Source IP address from where the event occurred.
Destination Country	Destination country name from where the event occurred.
Client Hostname	The hostname of the client requesting the DHCP server.
Malware Info	Information about the malware.
Destination IP	Destination IP address of the event.
Source Port	Source port of the event.
Destination Port	Destination port of the event.
Description	Description of the log.
Attack Name	Attack name of the log.
Threat Severity	The threat severity of the event.

Table 28: Sky ATP Events Detail View Columns (continued)

Column	Description
Policy Name	The policy name in the log.
Action	Action taken for the event: warning, allow, and block.
Log Source	The IP address of the log source.
Application	The application from where the events or logs are generated.
Hostname	The hostname in the log.
Service Name	The name of the application service. For example, FTP, HTTP, SSH, and so on.
Nested Application	The nested application in the log.
Source Zone	The source zone of the log.
Destination Zone	The destination zone of the log.
Protocol ID	The protocol ID in the log.

Apptrack Events and Logs Overview

You can use the Apptrack Events page to view information about security events based on Apptrack policies. The Apptrack logs helps you analyze the applications, the users using these applications, and bandwidth consumed by the applications.

Use the Time Range slider, to quickly focus on the area of activity that you are interested in. Once the time range is selected, the data on the page is refreshed automatically. You can also use the Custom button to set a custom time range.

There are two ways to view your data. You can select either the summary view or the detail view.

Apptrack Events—Summary View

Click **Summary View** for a brief summary of all the Apptrack events in your network. The data presented in the area graph is refreshed automatically based on the selected time range.

You can use widgets to view critical information, such as top sources, top destinations, top users, and top applications. See [Table 27 on page 81](#) for descriptions of the widgets in this view.

Table 29: Apptrack Events Summary View Widgets

Widgets	Description
Top Sources	Top source IP addresses of the network traffic; sorted by event count.
Top Destinations	Top destination IP addresses of the network traffic; sorted by event count.
Top Users	Top users of the network traffic; sorted by event count.
Top Applications	Top applications of the network traffic; sorted by event count.

Apptack Events—Detail View

Click **Detail View** for comprehensive details of all Apptack events in a tabular format that includes sortable columns. You can sort the events using the Group by option. The table includes information such as the event name, source country, source IP, destination country, and so on.

See [Table 28 on page 82](#) for descriptions of columns in this view.

Table 30: Apptack Events Detail View Columns

Column	Description
Log Generated Time	The time when the log was generated.
Log Received Time	The time when the log was received.
Event Name	Event name of the log.
Source Country	Source country name from where the event originated.
Source IP	Source IP address from where the event occurred.
Destination Country	Destination country name from where the event occurred.
Destination IP	Destination IP address of the event.
Source Port	Source port of the event.
Destination Port	Destination port of the event.
Description	Description of the log.
Policy Name	The policy name in the log.
Event Category	The event category of the log
User Name	The username of the log.
Log Source	The IP address of the log source.
Application	The application from where the events or logs are generated.
Hostname	The hostname in the log.
Service Name	The name of the application service. For example, FTP, HTTP, SSH, and so on.

Table 30: Apptrack Events Detail View Columns (*continued*)

Column	Description
Nested Application	The nested application in the log.
Source Zone	The source zone of the log.
Destination Zone	The destination zone of the log.
Protocol ID	The protocol ID in the log.
Reason	The reason for the log generation.
NAT Source Port	The translated source port.
NAT Destination Port	The translated destination port.
NAT Source Rule Name	The NAT source rule name.
NAT Destination Rule Name	The NAT destination rule name.
NAT Source IP	The translated (or natted) source IP address. It can contain IPv4 or IPv6 addresses.
NAT Destination IP	The translated (also called natted) destination IP address.
Traffic Session ID	The traffic session ID of the log.
Logical System Name	The name of the logical system.
Rule Name	The name of the rule.
Profile Name	The name of the All events profile that triggered the event.

Threat Prevention-Hosts

IN THIS CHAPTER

- [Infected Hosts Overview | 87](#)
- [Infected Host Details | 88](#)

Infected Hosts Overview

Access this page from **Monitor > Threat Prevention > Hosts**.

The hosts page lists compromised hosts and their associated threat levels. From here, you can monitor and mitigate malware detections on a per host basis.

NOTE: You must select a Sky ATP realm from the available pulldown.

Compromised hosts are systems for which there is a high confidence that attackers have gained unauthorized access. When a host is compromised, the attacker can do several things to the computer, such as:

- Send junk or spam e-mail to attack other systems or distribute illegal software.
- Collect personal information, such as passwords and account numbers.

Compromised hosts are listed as secure intelligence data feeds (also called information sources.) The data feed lists the IP address or IP subnet of the host along with a threat level; for example, 130.131.132.133 and threat level 5. Once threats are identified, you can create threat prevention policies to take enforcement actions on the inbound and outbound traffic on these infected hosts.

Export Data—Click the Export button to download compromised host data to a CSV file. You are prompted to narrow the data download to a selected time-frame.

Infected Host Details

Access this page by clicking on the host IP from the **Hosts** page.

Use the host details page to view in-depth information about current threats to a specific host by time frame. From here you can change the investigation status and the blocked status of the host.

The information provided on the host details page is as follows:

Table 31: Threat Level Definitions

Threat Level	Definition
0	Clean; no action is required.
1-3	Low threat level. Recommendation: Disable this host.
4-6	Medium threat level. Recommendation: Disable this host.
7-10	High threat level. Host has been automatically blocked.

- **Host Status**—Displays the current state by threat level, which could be any of the levels described in the table above.
- **Investigation Status**—The following states of investigation are available: Open, In progress, Resolved - false positive, Resolved - fixed, and Resolved - ignored.
- **Policy override for this host**—The following options are available: Use configured policy (not included in infected hosts feed), Always include host in infected hosts feed, Never include host in infected hosts feed.

NOTE: The blocked status changes in relation to the investigation state. For example, when a host changes from an open status (Open or In Progress) to one of the resolved statuses, the blocked status is changed to allowed and the threat level is brought down to 0. Also, when the investigation status is changed to resolved, an event is added to the log at the bottom of the page.

- Host threat level graph—This is a color-coded graphical representation of threats to this host displayed by time frame. You can change the time frame, and you can slide the graph backward or forward to zoom in or out on certain times. When you zoom in, you can view individual days within a month.
- Expand time-frame to separate events—Use this check box to stretch a period of time and see the events spread out individually.
- Past threats—The date and status of past threats to this host are listed here. The time frame set previously also applies to this list. The description for each event provides details about the threat and the action taken at the time.

Access this page from the **Monitor** menu.

NOTE: C&C and Geo IP filtering feeds are only available with a Sky ATP premium license.

NOTE: When managing Sky ATP with Security Director, you must select a Sky ATP realm from the available pulldown.

The C&C servers page lists information on servers that have attempted to contact and compromise hosts on your network. A C&C server is a centralized computer that issues commands to botnets (compromised networks of computers) and receives reports back from them. Botnets can be used to gather sensitive information, such as account numbers or credit card information, or to participate in a distributed denial-of-service (DDoS) attack.

When a host on your network tries to initiate contact with a possible C&C server on the Internet, the SRX Series device can intercept the traffic and perform an enforcement action based on real-time intelligence feed information that identifies the C&C server IP address and URL.

- **Export Data**—Click the **Export** button to download C&C data to a CSV file. You are prompted to narrow the data download to a selected time-frame.
- **Report False Positives**—Click the **FP/FN** button to launch a new screen which lets you send a report to Juniper Networks, informing Juniper of a false position or a false negative. Juniper will investigate the

report, however, this does not change the verdict. If you want to make a correction (mark system as clean) you must do it manually.

The following information is available on this page.

Table 32: Command & Control Server Data Fields

Field	Definition
C&C Server	The IP address of the suspected command and control server.
C&C Threat Level	The threat level of the C&C server as determined by an analysis of actions and behaviors.
Hits	The number of times the C&C server has attempted to contact hosts on your network.
C&C Country	The country where the C&C server is located.
Last Seen	The date and time of the most recent C&C server hit.
Protocol	The protocol (TCP or UDP) the C&C server used to attempt communication.
Client Host	The IP address of the host the C&C server attempted to communicate with.
Action	The action taken on the communication (permitted or blocked).

Command and Control Server Details

Access this page by clicking the **External Server IP** from the **Command and Control Servers** page.

Use Command and Control Server Details page to view analysis information and a threat summary for the C&C server. The following information is displayed for each server.

- Total Hits
- Threat Summary (Threat level, Location, Category, Time last seen)
- Ports and protocols used

You can filter this information by clicking on the time-frame links: 1 day, 1 week, 1 month, Custom (select your own time-frame). You can also expand the time-frame to separate events using the slider.

Hosts That have Contacted This C&C Server

This is a list of hosts that have contacted the server. The information provided in this section is as follows:

Table 33: Command & Control Server Contacted Host Data

Field	Definition
Client Host	The name of the host in contact with the command and control server.
Client IP Address	The IP address of the host in contact with the command and control server. (Click through to the Host Details page for this host IP.)
C&C Threat Level	The threat level of the C&C server as determined by an analysis of actions and behaviors.
Action	The action taken on the communication (permitted or blocked).
Protocol	The protocol (TCP or UDP) the C&C server used to attempt communication.
Port	The port the C&C server used to attempt communication.
Device Name	The name of the device in contact with the command and control server.
Date Seen	The date and time of the most recent C&C server hit.
Username	The name of the host user in contact with the command and control server.

Associated Domains

This is a list of domains the destination IP addresses in the C&C server events resolved to.

Signatures

This is a list of command and control indicators that were detected.

HTTP File Download Overview

Access this page from the **Monitor** menu.

A record is kept of all file metadata sent to the cloud for inspection. These are files downloaded by hosts and found to be suspicious based on known signatures or URLs. From the main page, click the file’s signature to view more information, such as file details, what other malware scanners say about this file, and a complete list of hosts that downloaded this file.

NOTE: When managing Sky ATP with Security Director, you must select a Sky ATP realm from the available pulldown.

Export Data—Click the Export button to download file scanning data to a CSV file. You are prompted to narrow the data download to a selected time-frame.

The following information is available on this page.

Table 34: HTTP Scanning Data Fields

Field	Definition
File Signature	A unique identifier located at the beginning of a file that provides information on the contents of the file. The file signature can also contain information that ensures the original data stored in the file remains intact and has not been modified.

Table 34: HTTP Scanning Data Fields (*continued*)

Field	Definition
Threat Level	<p>The threat score.</p> <p>NOTE: Click the three vertical dots at the top of the column to filter the information on the page by threat level.</p>
Filename	<p>The name of the file, including the extension.</p> <p>NOTE: Enter text in the space at the top of the column to filter the data.</p>
Last Submitted	The time and date of the most recent scan of this file.
URL	<p>The URL from which the file originated.</p> <p>NOTE: Enter text in the space at the top of the column to filter the data.</p>
Malware	<p>The name of file and the type of threat if the verdict is positive for malware. Examples: Trojan, Application, Adware. If the file is not malware, the verdict is "clean."</p> <p>NOTE: Enter text in the space at the top of the column to filter the data.</p>
Category	<p>The type of file. Examples: PDF, executable, document.</p> <p>NOTE: Enter text in the space at the top of the column to filter the data.</p>

HTTP File Download Details

To access this page, navigate to **Monitor > Threat Prevention > HTTP File Download**. Click on the **File Signature** to go to the File Scanning Details page.

Use this page to view analysis information and malware behavior summaries for the downloaded file. This page is divided into several sections:

Report False Positives—Click the **Report False Positive** button to launch a new screen which lets you send a report to Juniper Networks, informing Juniper of a false position or a false negative. Juniper will investigate the report, however, this does not change the verdict. If you want to make a correction (mark system as clean) you must do it manually.

Printable View—Click this link to organize the information into a print-ready format.

The top of the page provides a quick view of the following information (scroll to the right in the UI to see more boxes):

- **Threat Level**—This is the threat level assigned (0-10), This box also provides the threat category and the action taken.
- **Top Indicators**—In this box, you will find the malware name, the signature it matches, and the IP address/URL from which the file originated.
- **Prevalence**—This box provides information on how often this malware has been seen, how many individual hosts on the network downloaded the file, and the protocol used.

File Summary

Table 35: General Summary Fields

Field	Definition
Threat Level	This is the assigned threat level 0-10. 10 is the most malicious.
Global Prevalence	How often this file has been seen across different customers.
Last Scanned	The time and date of the last scan to detect the suspicious file.
File Name	The name of the suspicious file. Examples: unzipper-setup.exe, 20160223158005.exe,, wordmui.msi.
Category	The type of file. Examples: PDF, executable, document.
File Size	The size of the downloaded file.
Platform	The target operating system of the file. Example. Win32
Malware Name	If possible, Sky ATP determines the name of the malware.
Malware Type	If possible, Sky ATP determines the type of threat. Example: Trojan, Application, Adware.

Table 35: General Summary Fields (*continued*)

Field	Definition
Malware Strain	If possible, Sky ATP determines the strain of malware detected. Example: Outbrowse.1198, Visicom.E, Flystudio.
sha256 and md5	One way to determine whether a file is malware is to calculate a checksum for the file and then query to see if the file has previously been identified as malware.

In the Network Activity section, you can view information in the following tabs:

- **Contacted Domains**—If available, lists any domains that were contacted while executing the file in the Sky ATP sandbox.
- **Contacted IPs**—If available, lists all IPs that were contacted while executing the file, along with the destination IP's country, ASN, and reputation. The reputation field is based on Juniper IP intelligence data destination.
- **DNS Activity**— This tab lists DNS activity while executing the file, including reverse lookup to find the domain name of externally contacted servers. This tab also provides the known reputation of the destination servers.

HTTP Downloads

This is a list of hosts that have downloaded the suspicious file. Click the **IP address** to be taken to the Host Details page for this host. Click the **Device Serial number** to be taken to the Devices page. From there you can view device versions and version numbers for the Sky ATP configuration, including profile, whitelist, and blacklist versions. You can also view the malware detection connection type for the device: telemetry, submission, or C&C event.

Threat Prevention-Email Quarantine and Scanning

IN THIS CHAPTER

- SMTP Quarantine Overview | 98
- Email Attachments Scanning Overview | 100
- Email Attachments Scanning Details | 101

SMTP Quarantine Overview

Access this page from the **Monitor** menu.

The SMTP quarantine monitor page lists quarantined emails with their threat score and other details including sender and recipient. You can also take action on quarantined emails here, including releasing them and adding them to the blacklist.

The following information is available from the Summary View:

Table 36: Blocked Email Summary View

Field	Description
Time Range	Use the slider to narrow or increase the time-frame within the selected the time parameter in the top right: 12 hrs, 24 hrs, 7 days or custom.
Total Email Scanned	This lists the total number of emails scanned during the chosen time-frame and then categorizes them into blocked, quarantined, released, and permitted emails.
Malicious Email Count	This is a graphical representation of emails, organized by time, with lines for blocked emails, quarantined and not released emails, and quarantined and released emails.
Emails Scanned	This is a graphical representation of emails, organized by time, with lines for total emails, and emails with one or more attachments.

Table 36: Blocked Email Summary View (*continued*)

Field	Description
Email Classification	This is another graphical view of classified emails, organized by percentage of blocked emails, quarantined and not released emails, and quarantined and released emails.

The following information is available from the Detail View:

Table 37: Blocked Email Detail View

Field	Description
Recipient	The email address of the recipient.
Sender	The email address of the sender.
Subject	Click the Read This link to go to the Sky ATP quarantine portal and preview the email.
Date	The date the email was received.
Malicious Attachment	Click on the attachment name to go to the Sky ATP file scanning page where you can view details about the attachment.
Size	The size of the attachment in kilobytes.
Threat Score	The threat score of the attachment, 0-10, with 10 being the most malicious.
Threat Name	The type of threat found in the attachment, for example, worm or trojan.
Action	The action taken, including the date and the person (recipient or administrator) who took the action.

Using the available buttons on the Details page, you can take the following actions on blocked emails:

- Add domain to blacklist
- Add sender to blacklist
- Release

Recipient	Specifies the email address of the recipient.

Table 41: Blocked Email Detail View (*continued*)

Field	Description
Sender	Specifies the email address of the sender.
Subject	Click Read This to go to the Sky ATP quarantine portal and preview the email.
Date	Specifies the date the email was received.
Malicious Attachment	Click on the attachment name to go to the Sky ATP file scanning page where you can view details about the attachment.
Size	Specifies the size of the attachment in kilobytes.
Threat Score	Specifies the threat score of the attachment, in a scale of 0-10, with 10 being the most malicious.
Threat Name	Specifies the type of threat found in the attachment, for example, worm or trojan.
Action	Specifies the action taken, including the date and the person (recipient or administrator) who took the action.

Using the available buttons on the Details page, you can take the following actions on blocked emails:

- Unblock Attachment for Selected User(s)
- Unblock Attachment for All Users

RELATED DOCUMENTATION

Threat Prevention-Manual Upload

IN THIS CHAPTER

- [Manual Scanning Overview | 106](#)
- [File Scanning Limits | 107](#)

Manual Scanning Overview

Access this page from the **Monitor** menu.

If you suspect a file is suspicious, you can manually upload it to the cloud for scanning and evaluation. Click the **Manual Upload** button to browse to the file you want to upload. The file can be up to 32 MB.

Benefits of Manually Scanning Files

- Allows you to investigate files that weren't filtered by existing blacklists.
- Provides all file analysis data that accompanies known suspicious files, such as behavior analysis and network activity.

There is a limit to the number of files administrators can upload for manual scanning. File uploads are limited by realm (across all users in a realm) in a 24-hour period. You can upload two files per each active device enrolled and 10 files per each premium-licensed device in your account. For example, if you have two Sky ATP premium-licensed SRX Series devices and one other SRX Series device, Sky ATP will allow a maximum of 22 files to be allowed in a 24-hour window.

NOTE: You must have an SRX Series device registered with Sky ATP in order to use the manual file scanning feature.

Table 42: File Scanning Data Fields

Field	Definition
File Signature	A unique identifier located at the beginning of a file that provides information on the contents of the file. The file signature can also contain information that ensures the original data stored in the file remains intact and has not been modified.
Threat Level	The threat score.
Filename	The name of the file, including the extension.
Last Submitted	The time and date of the most recent scan of this file.
URL	The URL from which the file originated.
Verdict	The name of file and the type of threat if the verdict is positive for malware. Examples: Trojan, Application, Adware. If the file is not malware, the verdict is "clean."
Category	The type of file. Examples: PDF, executable, document.

File Scanning Limits

There is a limit to the number of files which can be submitted to the cloud for inspection. This limit is dictated by the device and license type. When the limit is reached, the file submission process is paused.

NOTE: This limit applies to all files, HTTP and SMTP.

Limit thresholds operate on a sliding scale and are calculated within 24-hour time-frame starting "now."

Perimeter Device	Free License (files per day)	Premium License (files per day)
SRX340	200	1,000
SRX345	300	2,000
SRX550m	500	5,000
SRX1500	2,500	10,000
SRX5400	5,000	50,000
SRX5600	5,000	70,000
SRX5800	5,000	100,000
vSRX(10mbps)	25	200
vSRX(100mbps)	200	1,000
vSRX(1000mbps)	2,500	10,000
vSRX(2000mbps)	2,500	10,000
vSRX(4000mbps)	3,000	20,000

Applications

IN THIS CHAPTER

- [Application Visibility Overview | 114](#)
- [Blocking Applications and Users | 118](#)

Application Visibility Overview

You can use the Application Visibility page to view information on bandwidth consumption, session establishment, and the risks associated with your applications.

There are two ways to view your data. You can select either the Chart view or Grid view. By default, the data is displayed in Chart view.

Chart View

Click the **Chart View** link for a brief summary of the top 50 applications consuming maximum bandwidth in your network. The data can be presented graphically as a bubble graph, heat map, or zoomable bubble graph. The data is refreshed automatically based on the selected time range. You can also use the Custom button to set a custom time range.

You can hover over your applications to view critical information such as total number of sessions, total number of blocks, category, bandwidth consumed, risk levels, and characteristics. You can also view the top five users accessing your application. Sessions appear as links, when you click a link, the All Events page appears.

Starting in Junos Space Security Director Release 16.1, you can click the **View All Users** link to show all the users accessing an application. You also see the User Visibility page in grid view with the correct filter applied.

Starting in Junos Space Security Director Release 16.1, you can click the **View All Users** link to show all the users accessing an application. You also see the User Visibility page in grid view with the correct filter applied.

[Table 45 on page 115](#) describes the widgets in Chart view.

Table 45: Application Visibility Chart View Columns

Field	Description
All Devices	Shows data for all the devices managed by Security Director. Click Edit to select individual devices to view the result.
Show By	<p>Select from the following options to view a user's data:</p> <ul style="list-style-type: none"> • Bandwidth - Shows data based on the amount of bandwidth the application has consumed for a particular time range. • Number of Sessions - Shows data based on the number of sessions consumed by the application.
Time Span	<p>Select the required time range to view a user's data.</p> <p>Use the custom option to choose the time range if you want to view data for more than one day. The time range is from 00:00 hours to 23:59 hours.</p>
Select graph	<p>Select from the following graphical representations to view an application's data:</p> <ul style="list-style-type: none"> • Bubble Graph • Heat Map • Zoomable Bubble Graph <p>By default, data is shown in the Bubble Graph format.</p>
Group By	<p>Select from the following options to view the application's data:</p> <ul style="list-style-type: none"> • Risk - Groups by critical, high, unsafe levels, and so on. • Category - Groups by category such as web, infrastructure, and so on.
Number of Sessions	Shows total number of application sessions.
Number of Blocks	Shows total number of times the application was blocked.
Bandwidth	Shows bandwidth usage of the application.
Risk Level	Shows risk associated with the application. For example, critical, high, unsafe, and so on.
Category	Shows category of the application. For example, web, infrastructure, and so on.
Characteristics	Shows characteristics of the application. For example, prone to misuse, bandwidth consumer, capable of tunneling, and so on.
Block User(s)	Blocks the user from using the application.

Table 45: Application Visibility Chart View Columns (*continued*)

Field	Description
Block Application	Blocks the usage of the application.
View All Users	Shows all the users accessing the application.

Grid View

Click the **Grid View** link for comprehensive details on applications. You can view top users by volume, top applications by volume, top category by volume, top characteristics by volume, and sessions by risk. You can also view the data in a tabular format that includes sortable columns. You can sort the applications in ascending or descending order based on application name, risk level, and so on. [Table 46 on page 116](#) describes the widgets in this view. Use these widgets to get an overall, high-level view of your applications, users, and the content traversing your network.

Table 46: Application Visibility Grid View Widgets

Widget	Description
Top Users By Volume	Top users of the application; sorted by bandwidth consumption.
Top Apps By Volume	Top applications, such as Amazon, Facebook, and so on of the network traffic; sorted by bandwidth consumption.
Top Category By Volume	Top category, such as web, infrastructure, and so on of the application; sorted by bandwidth consumption.
Top Characteristics By Volume	Top behavioral characteristics, such as prone to misuse, bandwidth consumer, and so on of the application.
Sessions By Risk	Number of events/sessions received; grouped by risk.

[Table 47 on page 117](#) describes the fields in the table below the widgets. Users are displayed by usernames or IP addresses. When you click a link, the User Visibility page in Grid view appears with the correct filter applied. Sessions are also displayed as links and when you click a link, the All Events page appears with all security events.

You can select an application or a user to perform a block operation.

Table 47: Detail View of Applications

Field	Description
Application Name	Name of the application, such as Amazon, Facebook, and so on.
Risk Level	Risk associated with the application: critical, high, unsafe, moderate, low, and unknown.
Users	Total number of users accessing the application.
Volume	Bandwidth used by the application.
Total Sessions	Total number of application sessions.
No of Rejects	Total number of sessions blocked.
Category	Category of the application, such as web, infrastructure, and so on.
Sub Category	Subcategory of the application. For example, social networking, news, and advertisements.
Characteristics	Characteristics of the application. For example, prone to misuse, bandwidth consumer, capable of tunneling.

Release History Table

Blocking Applications and Users

You can block applications and users based on network access policies, users and their job roles, and time. The blocking feature offers application control to organizations to accelerate business-critical applications, stagger non-critical applications, selectively accelerate socio-business applications, and block undesirable applications.

Blocking applications or users requires policy rules to be edited. View policy changes by clicking the policy name or view affected devices by clicking the device count. You see only policies permitting this traffic in the past 30 days.

You can block users and applications from the Application Visibility page.

To block an application:

1. Select **Monitor > Applications**. The Application Visibility page appears.
2. In Chart view, hover over the application that you want to block.

The application page appears with information on the number of sessions, bandwidth, number of blocks, risk level, category, characteristics, top five users, view all users link, and options to block applications and users.

NOTE: You see the number of sessions as links. When you click a link, the All Events page appears and displays the events that generated those sessions.

Click the **View All Users** link to display the User Visibility page in Grid view with the correct filter applied.

NOTE: In Grid view, select an application and click **Block Application**.

The Block page appears with the application name and the top five users of the application.

3. Click **Block Application** to block users from accessing the selected application.

The Block Application page appears with the policies that contain the rules required to block the application. The listed policies will be edited to block all users from accessing the selected application.

4. Click a policy to preview the policy details.

The Policy Changes Preview page appears with information on the number of rules added, modified, and deleted. You can preview the policy details. You can attach or add a schedule under the Rule options column.

5. Click **OK**.
6. Click **Save** to save your changes.
7. Click **Publish** to publish your policies.
8. Click **Update** to update your policies on devices.

To block a user:

1. Select **Monitor > Applications**. The Application Visibility page appears.
2. In Chart view, hover over the application that you want to block.

The application page appears with information on number of sessions, bandwidth, number of blocks, risk level, category, characteristics, top five users, view all users link, and options to block applications and users.

NOTE: You see the number of sessions as links. When you click a link, the All Events page appears and displays the events that generated those sessions.

When you click View All Users link, the User Visibility page in Grid view appears with the correct filter applied.

NOTE: In Grid view, select an application and click **Block Application**. The Block page appears with top five users.

3. Select a user you want to block and click **Block User(s)**.

The Block Users page appears with policies that contain the rules required to block the user from accessing the selected application.

4. Click a policy to preview the policy changes.

Starting in Junos Space Security Director 16.1, you can preview the policy details. The Policy Changes Preview page appears with information on the number of rules added, modified, and deleted. You can preview the policy details. You can attach or add a schedule under the Rule options column.

- 5. Click **OK**.
- 6. Click **Save** to save your changes.
- 7. Click **Publish** to publish your policies.
- 8. Click **Update** to update your policies on devices.

Release History Table

Release	Description

- Blocking Users and Applications | 124

User Visibility Overview

You can use the User Visibility page to view information related to the bandwidth consumption, session establishment, and the risks associated with the users.

Starting in Junos Space Security Director Release 16.1, users are displayed on the page by username and, if the user name is not available, by source IP address.

There are two ways to view your data. You can select either the Chart View or Grid View.

Chart View

By default, the user's data is shown in the Chart view. It shows the top 50 users consuming maximum bandwidth in your network. The data can be presented graphically as a bubble graph, heat map, or zoomable bubble graph. The data is refreshed automatically based on the selected time range.

You can hover over a username or source IP to view critical information such as total number of sessions and bandwidth consumed. The sessions are shown as links. When you click a link, the All Events page appears with all security events.

Starting in Junos Space Security Director Release 16.1, you can view all the applications accessed by the user by clicking the **View All Applications** link. When you click the **View All Applications** link, the Application Visibility page in Grid view is displayed with the correct filter applied.

You can block a user or an application.

[Table 48 on page 122](#) shows the different filters you can use to view the user's data in Chart view.

Table 48: Chart View Filters

Filter Name	Description
All Devices	Shows data for all the devices managed by Security Director. Click Edit to select individual devices to view the result.
Show By	<p>Select from the following options to view the user's data:</p> <ul style="list-style-type: none"> • Bandwidth - Shows data based on the amount of bandwidth the user has consumed for a particular time range. • Number of Sessions - Shows data based on the number of sessions consumed by the user.
Time Span	<p>Select the required time range to view the user's data.</p> <p>Use the custom option to choose the time range if you want to view data for more than one day. The date range is from 00:00 hours to 23:59 hours.</p>
Select Graph	<p>Select from the following graphical representation to view a user's data:</p> <ul style="list-style-type: none"> • Bubble Graph • Heat Map • Zoomable Bubble Graph <p>By default, data is shown in the Bubble Graph format.</p>
Number of Sessions	Shows total number of user sessions.
Bandwidth	Shows bandwidth usage of the user.
Block User	Blocks the user from using the application.
Block Application(s)	Blocks the usage of the application.
View All Applications	Shows all the applications accessed by the user.

Grid View

Click **Grid View** to view the user's data in the tabular format. [Table 49 on page 123](#) and [Table 50 on page 123](#) describe the fields on this page. You can view top users by volume and top applications by volume. Grid view provides a detailed view of all the users. By default, data is sorted based on the bandwidth usage.

Table 49: Grid View Widgets

Widget Name	Description
Top Users By Volume	List the top five users sorted by their bandwidth consumption.
Top Apps By Volume	List the top five applications being accessed in your network for the specified time range.

The sessions and applications are shown as links. When the user clicks a session link, the All Events page appears with all security events. When the user clicks an application link, the Application Visibility page in Grid view appears with the correct filter applied.

Table 50: Detailed View of the User

Field Name	Description
User Name	Shows the name of a user.
Volume	Shows the bandwidth consumption of a user.
Total Sessions	Shows the number of user sessions.
Applications	Shows all the applications used by a user for the time range.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, users are displayed on the page by username and, if the user name is not available, by source IP address.
16.1	Starting in Junos Space Security Director Release 16.1, you can view all the applications accessed by the user by clicking the View All Applications link.

- Blocking Source IP Addresses | 130

Source IP Visibility Overview

Starting in Junos Space Security Director Release 16.1, you can use the Source IP Visibility page to view information related to bandwidth consumption, session establishment, and the risks associated with the source IP addresses.

There are two ways to view your data. You can select either the Chart View link or Grid View link. The top 50 source IP addresses are displayed for a time span of one day, by default.

Chart View Overview

Click the **Chart View** link for a brief summary of the top 50 source IP addresses consuming the maximum bandwidth in your network. The data can be presented graphically as a bubble graph, heat map, or zoomable bubble graph. The data is refreshed automatically based on the selected time range.

You can hover over the source IP addresses to view critical information such as total number of sessions, total bandwidth consumption, and top five applications, bandwidth consumption, and sessions for each application. To view all the applications of an IP address, click **View All Applications**.

By default, the data is shown in the chart view. [Table 51 on page 127](#) shows the different filters you can use to view the source IP address data in chart view.

Table 51: Source IP Visibility—Filters in Chart View

Filter	Description
All Devices	By default, data is shown for all the devices in the network. Click Edit to select individual devices to view them in the chart.

Table 51: Source IP Visibility—Filters in Chart View (*continued*)

Filter	Description
Show By	<p>Select the following options from the list to view the source IP address data:</p> <ul style="list-style-type: none"> • Bandwidth—Shows data based on the amount of bandwidth the source IP address has consumed for a particular time range. • Number of Sessions—Shows data based on the number of sessions consumed by the source IP addresses.
Time Span	<p>Select the required time range from the list to view the source IP address data.</p> <p>Use the Custom option to choose the time range if you want to view data for more than one day. The date range is from 00:00 hours to 23:59 hours.</p>
Select Graph	<p>Select the way you want to view the source IP address data:</p> <ul style="list-style-type: none"> • Bubble graph • Heat map • Zoomable bubble graph <p>By default, data is shown in the bubble graph format.</p>

Grid View Overview

Click the **Grid View** link for comprehensive details of source IP addresses. You can view top source IP addresses by volume and top applications by volume. You can also view the data in a tabular format that includes sortable columns. You can sort the source IP addresses in ascending or descending order. Use the widgets to get an overall, high-level view of your source IP addresses. You can use the detailed view to get more information about the applications, source IP addresses, and content traversing your network.

The column width, sort order, and column index are continual. The next time you log in, they will be right where you left them.

[Table 52 on page 128](#) and [Table 53 on page 129](#) describe the fields on this page.

Table 52: Source IP Visibility—Widgets in Grid View

Widget	Description
Top IPs By Volume	Lists top five IP addresses sorted by their bandwidth consumption.
Top Apps By Volume	Lists top five applications being accessed in your network for the specified time range.

Table 53: Source IP Visibility—Detailed View

Field	Description
Source IP	Shows the source IP addresses.
Volume	Shows the bandwidth consumption of the source IP address.
Total Sessions	Shows the number of sessions of the source IP address. Click this field to see the logs that contributed to these sessions, in the All Events page.
Applications	Shows all the applications used by the source IP address. Click the application to see a detailed view of the applications in the Application Visibility page.

You can invoke the block workflow for any source IP from the grid view.

To invoke the block workflow for a source IP address, you can perform one of the following tasks:

- Select a source IP address and click **Block IP**. The Block page appears.
- Select a source IP address and click **Block User**. The Block Users page appears.
- Select a source IP address, and then select the required applications from the Top 5 Applications field and click **Block Application(s)**. The Block Application page appears.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, you can use the Source IP Visibility page to view information related to bandwidth consumption, session establishment, and the risks associated with the source IP addresses.

RELATED DOCUMENTATION

| [Blocking Source IP Addresses](#) | 130

Blocking Source IP Addresses

You can block a source IP address from accessing either all applications or only selected applications by editing policy rules. Then you can view the policy changes by clicking the policy name or view affected devices by clicking the device count. Also, you can click the policy to view the affected rules, edit the rules, and save them, if required.

To block the source IP address:

1. Select **Monitor > Source IP**.

The Source IP Visibility page appears.

2. In the Chart View, hover over the source IP address for which you want to block applications.

A pop up window appears showing the information on the number of sessions, bandwidth consumption, and top five applications of that particular IP address.

NOTE: Click **View All Applications** to view all the applications of the source IP address on the Application Visibility page. You can select an application and block it by clicking **Block Application**.

3. Block the source IP address from accessing all applications by clicking **Block IP**.

The Block Application page appears.

Block the source IP address from accessing a particular application by selecting the application listed under the Top 5 Applications table, and then click **Block Application(s)**.

The Block User page appears. All the policies that need to be edited to block the IP address from accessing the applications are listed under the Policy Name column.

4. Select the required policies to edit the rules to block the IP address.
5. Select **Run now** to immediately publish or update the changes or select **Schedule at a later time** to publish or update the changes later.
6. Click **Save** to save the configuration settings.

Click **Publish** to publish the changes.

Click **Update** to update the changes.

Live Threat Map

IN THIS CHAPTER

- Threat Map Overview | 132
- Blocking Threat Events | 134

Threat Map Overview

The threat map allows you to visualize geographical regions for incoming and outgoing traffic. You can view blocked and allowed threat events based on feeds from IPS, antivirus, and antispam engines. Unsuccessful login attempts for devices are also displayed. An event count for each attack object can be viewed by clicking a specific geographical location. This is useful for viewing unusual activity that could indicate a possible attack. If you have deployed your firewall devices across the globe, you can find the country that is attacking your firewall devices the most by using the threat map.

Threats are color-coded and can be seen at the bottom of the page. You also get a quick view of total number of threats blocked and allowed, an individual count of threats blocked and allowed for each event, as well as the top targeted devices, top destination countries, and top source countries.

You can click any individual source or destination point on the map to review information about the threat events, including the number of threat events, type of threat, time of events, source IP, and destination IP. You can also perform further analysis of the attack by clicking the attack type and viewing the filtered list of events from the Event Viewer.

Starting in Junos Space Security Director Release 16.1, you can click a country on the threat map to bring up the respective country page. You can view the total threat events since midnight, followed by inbound and outbound threat events. You see the highest top five inbound and outbound IP addresses. You can also view all IP addresses with the option to block one or more of them. In addition, you can block all traffic or only the inbound and outbound traffic for the selected country.

Click **View Details** to see more details for the country on the right panel. In addition, you can see total number of inbound and outbound threats for each event.

[Table 54 on page 133](#) describes different types of threats blocked and allowed.

Table 54: Types of Threats

Attack	Description
IPS Threat Events	<p>Intrusion detection and prevention (IDP) attacks detected by the IDP module.</p> <p>The information reported about the attack includes:</p> <ul style="list-style-type: none"> • Source of attack • Destination of attack • Type of attack • Session information • Severity • Policy information that permitted the traffic. • Action: traffic permitted or dropped.
Spam Events	<p>E-mail spam that is detected based on the blacklist spam e-mails.</p> <p>The information reported about the attack includes:</p> <ul style="list-style-type: none"> • Source • Action: E-mail is rejected or allowed. • Reason for identifying as e-mail spam.
Virus Events	<p>Virus attacks detected by the antivirus engine.</p> <p>The information reported about the attack includes:</p> <ul style="list-style-type: none"> • Source of the infected file • Destination • Filename • URL used for accessing the file
Device Authentications	<p>The firewall authentication messages generated due to unauthorized attempts to access the network. The reported information contains the reason for authentication failure and the source of the request.</p>
Screen	<p>A type of threat detected by SRX Series devices. The information reported about the attack includes:</p> <ul style="list-style-type: none"> • Attack name • Action taken • Source of the attack • Destination of the attack

Table 54: Types of Threats (*continued*)

Attack	Description
Sky ATP	<p>A type of threat detected by SRX Series devices in collaboration with Sky ATP software. The information reported about the attack includes:</p> <ul style="list-style-type: none"> • Malware name • Action taken • Infected host • Source of the attack • Destination of the attack

NOTE: Threats with unknown geographical IP addresses are displayed as undefined.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, you can click a country on the threat map to bring up the respective country page.

[Blocking Threat Events | 134](#)

Blocking Threat Events

Starting in Junos Space Security Director Release 16.1, you can block all traffic or block only the inbound and outbound traffic for a selected country. When you click a country on the threat map, the country page appears with details on total threat events since midnight, followed by inbound and outbound threat events. You can see the highest top five inbound and outbound IP addresses. You can select one or more IP addresses to block.

Blocking an IP address or a country requires policy rules to be edited. View policy changes by clicking the policy name or view affected devices by clicking the device count. Only policies permitting this traffic in the past 30 days are shown.

NOTE: Click **View Details** to see more details for the country on the right panel.

Click **View All** to view all the inbound and outbound IP addresses.

Following block operations are described below:

- To block IP addresses
- To block all traffic
- To block outbound traffic
- To block inbound traffic

To block IP addresses:

1. Select **Monitor > Threats Map (Live)**.

A geographical map is displayed with incoming and outgoing traffic.

2. Click a country in the map.

The corresponding country page appears with details on the threat events since midnight, as well as the highest top five inbound and outbound IP addresses. You can also view the details of the inbound and outbound events for the selected country.

3. Click the **Inbound** or the **outbound** tab, and then select one or more IP addresses.

4. Click **Block IP Address**.

The Block (Outbound or Inbound) IP Address page appears with policies that contain the rules. The listed policies are edited to block all inbound or outbound traffic from the selected IP addresses.

5. Click a policy.

The Policy Preview Changes page appears with the number of rules added, modified, and deleted. You can preview the policy rules.

6. Click **OK** to close the Policy Changes Preview page.

7. Click **Save** to save your changes.

8. Click **Publish** to publish your changes.

9. Click **Update** to update your changes.

To block all traffic:

1. Select **Monitor > Threats Map (Live)**.

A geographical map is displayed with incoming and outgoing traffic.

2. Click a country.

The corresponding country page appears with details on the threat events since midnight, as well as the highest top five inbound and outbound IP addresses. You can view the details of the inbound and outbound events for the selected country.

3. Click **Block all traffic** to block all traffic from the selected country.

The Block all traffic page is displayed with the policies that contain the rules to be edited to block all the traffic from the selected country.

4. Click a policy.

The Policy Changes Preview page is displayed with the number of rules added, modified, and deleted. You can preview the rules.

5. Click **OK** to close the Policy Changes Preview page.

6. Click **Save** to save your changes.

7. Click **Publish** to publish your changes.

8. Click **Update** to update your changes.

You can block traffic sent from one country to another country (outbound traffic).

To block outbound traffic:

1. Select **Monitor > Threats Map (Live)**.

A geographical map is displayed with incoming and outgoing traffic.

2. Click a country that is sending traffic to another country.

The corresponding country page appears with details on the threat events since midnight, as well as the highest top five inbound and outbound IP addresses.

3. Click **Block outbound**.

The Block Outbound page is displayed with the policies that contain the rules to be edited to block all outbound traffic from the selected country.

4. Click a policy.

The Policy Changes Preview page is displayed with the number of rules added, modified, and deleted. You can preview the rules.

5. Click **OK** to close the Policy Changes Preview page.

6. Click **Save** to save your changes.

7. Click **Publish** to publish your changes.

8. Click **Update** to update your changes.

You can block traffic coming to a country from another country (inbound traffic).

To block inbound traffic:

1. Select **Monitor > Threats Map (Live)**.

A geographical map is displayed with incoming and outgoing traffic.

2. Click a country that is receiving traffic from another country.

The corresponding country page appears with details on the threat events since midnight, as well as the highest top five inbound and outbound IP addresses.

3. Click **Block inbound**.

The Block Inbound page is displayed with the policies that contain the rules to be edited to block all the inbound traffic to the destination country.

4. Click a policy.

The Policy Changes Preview page is displayed with the number of rules added, modified, and deleted. You can preview the rules.

5. Click **OK** to close the Policy Changes Preview page.

6. Click **Save** to save your changes.

7. Click **Publish** to publish your changes.

8. Click **Update** to update your changes.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, you can block all traffic or block only the inbound and outbound traffic for a selected country.

Alerts and Alarms - Overview

IN THIS CHAPTER

- [Alerts and Alarms Overview](#) | 139

Alerts and Alarms Overview

Alerts and notifications are used to notify administrators about significant events within the system. Notifications can also be sent through e-mail. You will be notified when predefined network traffic condition is met. Alert trigger threshold is number of network traffic events crossing a pre-defined threshold within a period of time. Alarms workspace shows active alarms of devices currently managed by Security Director.

Alerts and notifications provide options for:

- Defining alert criteria based on a set of predefined filters. You can use the filters defined in the Filter Management window on the Event Viewer page to generate alerts.
- Generating an alert message and notifying you when an alert criteria are met.
- Searching for specific alerts on the Generated Alerts page based on alert ID, description, alert definition, alert type, or recipient e-mail address.
- Supporting event-based alerts.

For example, If you are an administrator, you can define a condition such that if the number of firewall-deny events crosses a predefined threshold in a given time range for a specific device, you receive an e-mail alert.

NOTE: If a threshold is crossed and remains so for a long duration, new alerts are not generated. Alerts are generated again when the number of logs matching the alert criteria drops below the threshold and crosses the threshold again.

Understanding Role-Based Access Control for the Alerts and Alert Definitions

Role-Based Access Control (RBAC) has the following impact on the alerts:

NOTE: You must have Security Analyst or Security Architect role or have permissions equivalent to that role to access the alerts and alert definitions.

You must have the following privileges under Administration > Users & Roles > Roles:

- **Create Alert Definition** under Create Role > Privileges > Alerts > Alert Definitions to create alerts.
- **Modify Alert Definition** to modify alerts.
- **Delete Alert Definition** to delete alerts.
- **User account** under Role Based Access Control to search for user accounts in alert definitions.

Using Generated Alerts

Use the Generated Alerts page to view the system event-based alerts in response to a configured alert definition. The generated alerts help you to identify problems that appear in your monitored network environment. You can view statistics such as the number of critical and non-critical alerts.

Before You Begin

- Read the “[Alerts and Alarms Overview](#)” on page 139 topic.
- Review the Generated Alerts main page for an understanding of existing generated alarms. See “[Alert Definitions Main Page Fields](#)” on page 149 for field descriptions.
- You must add the following configuration to the managed SRX devices:

```
set snmp trap-group sdfm version all
set snmp trap-group sdfm destination-port 10164
set snmp trap-group sdfm categories authentication
set snmp trap-group sdfm categories chassis
set snmp trap-group sdfm categories link
set snmp trap-group sdfm categories routing
set snmp trap-group sdfm categories startup
set snmp trap-group sdfm categories rmon-alarm
set snmp trap-group sdfm categories vrrp-events
set snmp trap-group sdfm categories configuration
```

```
set snmp trap-group sdfm categories services
set snmp trap-group sdfm categories chassis-cluster
set snmp trap-group sdfm categories sonet-alarms
set snmp trap-group sdfm targets x.x.x.x (eth0 IP of space)
```

Using the Generated Alerts Page

To use the Generated Alerts page:

- 1. Select **Monitor > Alerts & Alarms > Alerts**. The Alerts page appears.
- 2. Use the guidelines provided in to learn about the page.

Table 55: Generated Alerts

Action	Guidelines
Jump to Event Viewer	Select the generated alert and then right-click or click More > Jump to Events and Logs . The corresponding events that triggered the alert are displayed.
Detail View	Select the generated alert and then right-click or click More > Detail View .
Clear All Selections	Select the generated alert and then right-click or click More > Clear All Selections .

Alerts and Alarms-Alert Definitions

IN THIS CHAPTER

- [Creating Alert Definitions | 144](#)
- [Editing Alert Definitions | 146](#)
- [Cloning Alert Definition | 147](#)
- [Deleting Alert Definitions | 148](#)
- [Searching Alert Definitions | 149](#)
- [Alert Definitions Main Page Fields | 149](#)

Creating Alert Definitions

Use the Alert Definitions page to generate alerts that warn you of problems in your monitored environment. An alert definition consists of data criteria for triggering an alert. An alert is triggered when the event threshold exceeds the data criteria that is defined.

You can create an alert definition to monitor your data in real time. You can identify issues and attacks before they impact your network.

For example, if you are an administrator, you can define a condition such that if the number of firewall deny events crosses a predefined threshold in a given time frame for a specific device, you receive an email alert.

Before You Begin

- Read the [“Alerts and Alarms Overview” on page 139](#) topic.
- Review the Alert Definitions main page for an understanding of your current data set. See [“Alert Definitions Main Page Fields” on page 149](#) for field descriptions.

Configuring Alert Definitions

To create an alert definition:

1. Select **Monitor > Alert & Alarms > Alert Definitions**.
2. Click the + icon.
3. Complete the configuration according to the guidelines provided in [Table 56 on page 145](#).
4. Click **Ok**.

A new alert definition with the configured alert triggering condition is created. You can view the generated alerts from the alert definition to troubleshoot the issues with your system.

Table 56: Alert Definitions Settings

Setting	Guideline
<i>General</i>	
Alert Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Alert Description	Enter a description for the alerts; maximum length is 1024 characters.
Alert Type	Displays the type of alert that is system based.
Status	Select the Active check box to view only the active alerts.
Severity	Select the severity level of the alert: Info, minor, major, critical.
<i>Trigger</i>	
Use Data Criteria from Filters	<p>Specifies the data criteria from the list of default and user-created filters that are saved from the Event Viewer.</p> <p>To add saved filters:</p> <ul style="list-style-type: none"> • Click the Use data criteria from filters link. The Add Saved Filters page appears. • Select the filters to be added. • Click OK.
Add Data Criteria	Specifies the data criteria based on the Time period, Group By, and Filter By option. Filtered data only displays the subset of data that meets the criteria that you specify.
<i>Recipient(s)</i>	

Table 56: Alert Definitions Settings (*continued*)

Setting	Guideline
Email address(es)	Specify the e-mail addresses for the recipients of the alert notification.
Custom Message	Enter a custom string for identifying the type of alert in the alert notification e-mail.

Alerts and Alarms-Alarms

IN THIS CHAPTER

- [Using Device Alarms | 151](#)
- [Device Alarms Main Page Fields | 153](#)

Using Device Alarms

Use this page to view system-generated alarms. Alarms provide information about the status and the health state of the system. The alarms received from the Junos Space platform are viewed from Security Director. These generated alarms can help you to troubleshoot issues associated with your system.

NOTE: On the right side of the banner is a bell-shaped icon called the Notification Center. Clicking this icon reveals lists of the most recent critical alerts and alarms in Security Director. Clicking the **View All Alarms** or **View All Alerts** link takes you to the detail page for the respective topic.

Before You Begin

- Read the [“Alerts and Alarms Overview” on page 139](#) topic.
- Configure the SRX Series devices to send SNMP traps to the Junos Space platform. The alarms displayed are new alarms based on the SNMP traps received by Security Director.
- In case of Space cluster, the SNMP target should be the eth0 IP address of all the nodes in Space cluster.
- The existing alarms prior to SNMP target configuration will not be displayed in Security Director.
- To view the alarms in Security Director, add the following configuration to the managed SRX Series devices through the CLI:

```
set snmp trap-group sdfm version all
```

```
set snmp trap-group sdfm destination-port 10164
```

- set snmp trap-group sdfm categories authentication
 - set snmp trap-group sdfm categories chassis
 - set snmp trap-group sdfm categories link
 - set snmp trap-group sdfm categories routing
 - set snmp trap-group sdfm categories startup
 - set snmp trap-group sdfm categories rmon-alarm
 - set snmp trap-group sdfm categories vrrp-events
 - set snmp trap-group sdfm categories configuration
 - set snmp trap-group sdfm categories services
 - set snmp trap-group sdfm categories chassis-cluster
 - set snmp trap-group sdfm categories sonet-alarms
 - set snmp trap-group sdfm targets x.x.x.x (eth0 IP of space)
- Review the Device Alarms main page for an understanding of existing device alarms. See [“Device Alarms Main Page Fields” on page 153](#) for field descriptions.

Using the Device Alarms Page

To use the Device Alarms page:

1. Select **Monitor > Alerts & Alarms > Alarms**. The Alarms page appears.
2. Use the guidelines provided in [Table 59 on page 152](#) to learn about the page.

Table 59: Generated Alarms

Action	Guidelines
View Alarm Details	Select the generated alarm and then right click or click More > Detail View .

VPN

IN THIS CHAPTER

- [IPsec VPN Monitoring Overview | 154](#)
- [About the Overview Page | 157](#)
- [Managing Monitored and Unmonitored VPNs | 159](#)
- [About the Monitored Tunnels Page | 160](#)
- [About the Devices Page | 161](#)

IPsec VPN Monitoring Overview

You can view the status of IPsec VPNs and their tunnels between device endpoints after configuring, publishing, and updating them in Security Director. The status is displayed in dashboard and tabular format. The number of tunnels for each VPN depends on the type of VPN, such as site-to-site, full-mesh, or hub-and-spoke. Security Director only supports route-based tunnel mode. You can view the tunnel status of IPsec VPNs configured on devices that are managed by Security Director.

IPsec VPN monitoring micro-service runs at specified intervals and updates the status of the IPsec VPN tunnel as up or down. It polls log collector data every 5 minutes by default and SRX Series device every 6 hours.

The following configuration should be done to send all the logs including KMD logs to Security Director log collector:

```
set system syslog host <IP> any any
```

```
set system syslog host <IP> structured-data
```

Here, **IP** is the log collector IP and **any any** means all the system logs will be sent to Security Director Log Collector.

[Figure 29 on page 155](#) shows the overview page. It displays the dashboards for monitoring current VPNs, its tunnels, and historical tunnel status pattern in the past.

In the Monitored Tunnels dashboard, you can view the total number of IPsec VPN tunnels and the number of tunnels that are up and down. Each block is a tunnel and is sorted by both modified date and created

date. Modified tunnels appears first followed by created tunnels. You can hover over each block to view the tunnel endpoints, status, when the tunnel was created and modified, and the IP addresses of the devices. If the status is down, then a reason is also displayed.

In the VPNs Overview dashboard, you can view the number of IPsec VPNs and their status. Hover over the chart to view the status as up or down.

In the No. of Monitored Tunnels Flipped Up/Down dashboard, you can select a duration from the period drop-down list to view the tunnel status pattern in the past. Based on the selected duration, a time range and graph are displayed with the tunnel status data. Hover over the graph to view the number of tunnels and its status during a particular time slot.

Figure 29: Overview Page

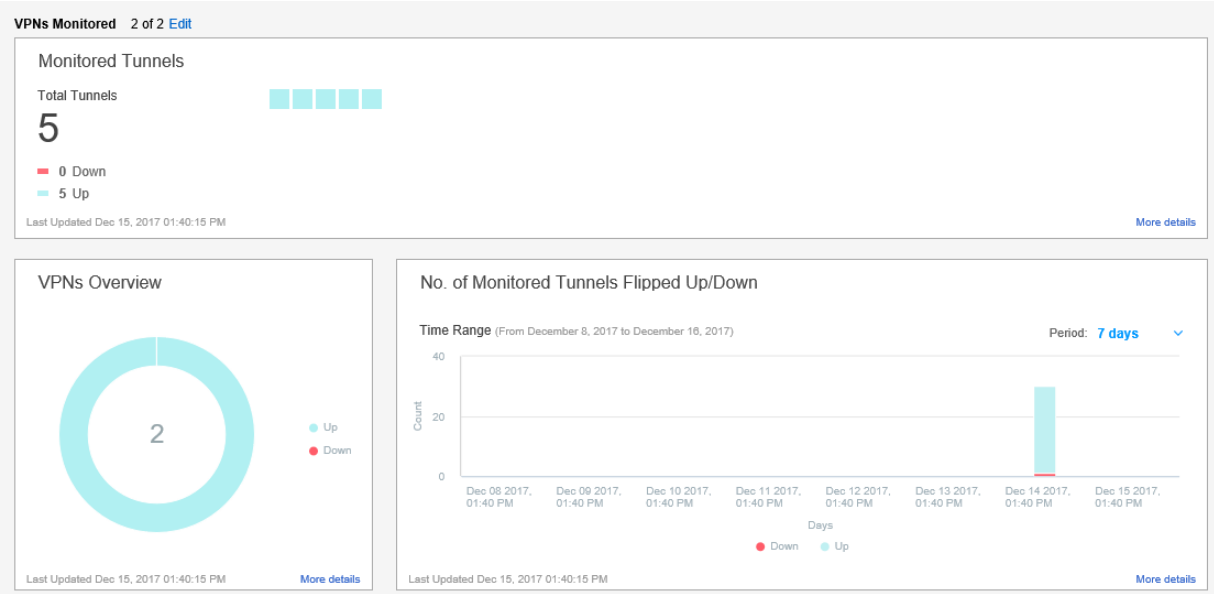

Figure 30 on page 156 shows the Monitored Tunnels page. It displays tunnel statistics in tabular format. It shows the IPsec VPNs and displays their tunnel status as up, down, or unknown. A reason is provided only for tunnels with a down status. You also see devices and their endpoints.

In previous releases of Security Director, network administrators had to analyze the VPN logs on an SRX Series device to check the status of VPNs and their tunnels. It required administrators to have expertise in parsing VPN logs to get the information they needed. Network Administrators can now view the IPsec VPN and its tunnel status directly in Security Director. A reason is displayed in the Security Director user interface when a tunnel is down.

Managing Monitored and Unmonitored VPNs

You can select IPsec VPNs for which you want to monitor status. You can view the total number of monitored VPNs in the Overview page. You can select VPNs that you want to start and stop monitoring in the Manage Monitoring VPNs page.

To start and stop monitoring VPNs:

1. Select **Monitor > VPN > Overview**.
2. Click **Edit**.
The Manage Monitoring VPNs page is displayed.
3. Select **All** to monitor the status of all the VPNs. Select **Any** to monitor the status of specific VPNs.
4. If you select **Any**, then you can select IPsec VPNs and use the > or < arrow to move them from Monitored VPNs to Unmonitored VPNs and vice versa. You can enter an IPsec VPN to search for in the text box.
5. Click **OK**.

You can view the total number of VPNs monitored in the Overview page.

Using Job Management in Security Director

Use the Job Management page to view all jobs that have been scheduled to run or have run from Junos Space Security Director. By default, jobs are sorted by the Scheduled Start Time column. Depending on your user account settings, you can view all jobs or only your jobs.

Before You Begin

- Read the [“Overview of Jobs in Security Director” on page 165](#) topic.
- Review the Job Management main page for an understanding of the existing jobs See [“Job Management Main Page Fields” on page 177](#) for field descriptions.

Using the Job Management Page

To use the Job Management page:

1. Select **Monitor > Job Management**.

The Job Management page appears.

2. Use the guidelines provided in [Table 64 on page 164](#) to learn about the page.

Table 64: Job Management Page Actions

Action	Guideline
View the details of a job	<p>Double-click a job or click the Detailed View icon that appears when you mouse over the job to view the details of that job.</p> <p>The Job Details page appears displaying the details of the audit log. See “Viewing the Details of a Job in Security Director” on page 167.</p>
Archive and purge audit logs	<p>Click the Archive/Purge icon in the toolbar to purge jobs after archiving them.</p> <p>The Archive/Purge Jobs page appears. See “Archiving and Purging Jobs in Security Director” on page 165.</p>
Cancel jobs	<p>Select one or more scheduled or in-progress jobs. From the right-click or More menu, and select Cancel Jobs. See “Canceling Jobs in Security Director” on page 169.</p>
Reassign Jobs	<p>Reassign scheduled or recurring jobs of one user to another user. See “Reassigning Jobs in Security Director” on page 170.</p>
Reschedule a job or modify the recurrence settings of a job	<p>Reschedule a scheduled job or modify the recurrence settings of a job. See “Rescheduling and Modifying the Recurrence of Jobs in Security Director” on page 172.</p>
Retry on Failed Devices	<p>Retry jobs that did not complete successfully on devices on which they were configured to re-run. See “Retrying a Failed Job on Devices in Security Director” on page 173.</p>

RELATED DOCUMENTATION

[Using Audit Logs in Security Director | 179](#)

Overview of Jobs in Security Director

A job is an action that is performed on any object that is managed by Junos Space, such as a device, service, or user. The Job Management page lets you monitor the status of jobs that have run or are scheduled to run in Junos Space. Jobs can be scheduled to run immediately or in the future.

Depending on the settings in your user account or remote profile, you can view only your own jobs or all jobs.

NOTE: A user with the Super Administrator or Job Administrator role assigned can view all jobs triggered by all users.

Junos Space maintains a history of job status for all jobs. When a job is initiated from a workspace, Junos Space assigns a unique ID to that job, which serves to identify the job (along with the job type) on the Job Management page. The following is a list of some of the job types supported in Security Director:

- Discover Network Elements
- Audit Log Archive/Purge
- Export Roles
- Export Device Configuration
- Add Application
- Resync Network Elements
- Role Assignment
- Delete Device

RELATED DOCUMENTATION

[Using Job Management in Security Director | 163](#)

[Job Management Main Page Fields | 177](#)

Archiving and Purging Jobs in Security Director

The Archive/Purge Jobs page enables you to archive and then purge jobs. You can purge jobs before a specified date and time. Jobs can be archived locally (on any node that is in the UP state) or to a remote server. When you archive jobs locally, the archive files are stored in the default `/var/lib/mysql/archive`

directory on the active Junos Space node. When you archive jobs to a remote server, the archive files are stored in the directory that you specify.

To archive and purge jobs:

1. Select **Monitor > Job Management**.

The Job Management page appears.

2. Click the **Archive/Purge** icon.

The Archive / Purge Jobs page appears.

3. Specify the jobs to be archived and purged according to the guidelines provided in [Table 65 on page 166](#).

4. Click **OK**.

A job is triggered and you are taken to the Job Management page. After a few seconds, the Job Detail: Job Archive and Purge page pops up displaying details of the job.

5. Click **OK** to close the Job Details page.

You are returned to the Job Management page.

Table 65: Archive/Purge Jobs Settings

Setting	Guideline
Archive Jobs Before	Specify a date and time (in MM/DD/YYYY and HH:MM:SS formats) before which jobs should be archived and purged. NOTE: You specify the time in the local time zone of the client computer, but the jobs are purged according to the time zone configured on the Junos Space server.
Archive Mode	Specify whether jobs are archived locally (on the active node) or on a remote server.
Job Type	Select the job type from the list to archive jobs of that type, or select the All option to archive all jobs, and then purge them from the database. Jobs that are already initiated or completed in Junos Space appear in the Job Type list. Jobs that are in progress or scheduled are not archived
Username	Enter the username of the user on the remote server.
Password	Enter the password of the user on the remote server.
Confirm Password	Reenter the password of the user on the remote server.

Table 65: Archive/Purge Jobs Settings (continued)

Setting	Guideline
Remote Server IP Address	<p>Enter the IPv4 or IPv6 address of the remote server.</p> <p>NOTE:</p> <ul style="list-style-type: none"> Depending on whether the Junos Space fabric is configured with only IPv4 addresses or both IPv4 and IPv6 addresses, Junos Space Platform allows you to enter an IPv4 address or either an IPv4 or IPv6 address respectively for the remote server. The IPv4 and IPv6 addresses that you use must be valid addresses. Refer to http://www.iana.org/assignments/ipv4-address-space for the list of restricted IPv4 addresses and http://www.iana.org/assignments/ipv6-address-space for the list of restricted IPv6 addresses.
Remote Server Directory	<p>Enter the full path of the directory (ending with /) on the remote server where the jobs will be archived.</p> <p>NOTE: The directory must already exist on the remote server.</p>
Purge jobs from all accessible domains	Select this check box to purge jobs from all domains to which you have access.
Type	<p>Specify whether the archive and purge operation should be run immediately or later.</p> <p>If you specify that the operation should be run later, you must specify a start date and time (in MM/DD/YYYY and HH:MM:SS 24-hour or AM/PM formats) for the archive and purge operation.</p>

Viewing the Details of a Job in Security Director

You can view the details of a job, which allows you to view information about the job at a quick glance on one page, from the Job Management page.

To view the details of a job:

1. Select **Monitor > Job Management**.

The Job Management page appears.

2. Double-click the job for which you want to view the details. Alternatively, select the job and from the More or right-click menu, select **View Job Details**.

The Job Details page appears. The fields displayed vary depending on the job:

- For a Discover Network Elements job, the IP Address and Hostname fields are displayed.
- For some jobs, the details of the job are displayed in a table. For example, for device discovery jobs, the device targets and their statuses are displayed; for network resynchronization jobs, the device IP addresses and their status are displayed.
- For some jobs, like Export Roles, Resync Network Elements, and so on, you can export the job details.
- For some jobs, you can retrigger the failed job or retry the job on failed targets and you can schedule jobs to run immediately or later.

[Table 66 on page 168](#) describes some of the fields on the Job Details page.

3. Click **OK**.

You are returned to the Job Management page.

Table 66: Job Details Fields

Field	Description
Job Type	Type of job. Job types indicate what tasks or operations are performed.
Job ID	ID of the job.
Job Name	Name of the job. For most jobs, the name is the job type with the job ID appended. However, for some jobs, the job name is supplied by the user as part of the workflow.
Job State	State of job execution: <ul style="list-style-type: none"> • Scheduled–Job is scheduled to run in the future. • Success–Job completed successfully. • Failure–Job failed and was terminated. • In Progress–Job is in progress. • Canceled–Job was canceled by a user. • Pending–Job is pending.
Percent	Percentage of the job that is completed.
User or Owner	Username of the owner who initiated the job.

Table 66: Job Details Fields (*continued*)

Field	Description
Scheduled Start Time	Date and time when the job is scheduled to start. NOTE: The time is stored as UTC time in the database but mapped to the local time zone of the client from which the UI is accessed.
Actual Start Time	Time when Junos Space Platform begins to execute the job. In most cases, the actual start time is the same as the scheduled start time.
End Time	Time when the job was completed or terminated if the job execution failed.
Summary	Operations executed for the job.

Canceling Jobs in Security Director

You can cancel jobs that are scheduled for execution as long as they are in the Scheduled, In Progress, or Pending state. You can also cancel jobs that are not completed for a long time or jobs that are hindering the execution of other jobs in the queue.

If you are a user who is assigned the privileges of a Job Administrator, you can cancel jobs scheduled by any user. If you are a user who is assigned the privileges of a Job User, you can cancel only those jobs that are scheduled by you. If you are assigned a role that does not allow you to cancel any job, you cannot cancel any job in the Jobs workspace.

NOTE:

- If Junos Space determines that the job operation cannot be interrupted, the job runs to completion; otherwise, the job is canceled.
- When you cancel jobs that are in-progress, some tasks associated with the job might be completed, depending on the stage at which you canceled the job. The status of the job on the Job Management page appears as Canceled.

To cancel one or more jobs:

1. Select **Monitor > Job Management**.

The Job Management page appears.

2. Select the jobs that you want to cancel. From the right-click or More menu, select **Cancel Jobs**.

The Cancel Job page appears, displaying the list of jobs selected for cancellation.

3. Click **Yes** to confirm that you want to cancel the selected jobs.

You are returned to the Job Management and the status of the jobs that were canceled changes to **Cancelled**.

RELATED DOCUMENTATION

[Using Job Management in Security Director | 163](#)

Reassigning Jobs in Security Director

You can reassign jobs owned by a user to another user within the same domain from the Job Management page. When you reassign a job, you transfer the ownership of the jobs from one user to another. To reassign the jobs of one user to another user, you must be assigned the privileges of a Job Administrator.

One scenario for reassigning jobs is if a user who is the owner of scheduled jobs is deleted from Junos Space. The jobs for that owner are canceled, so you can reassign the scheduled jobs to another user.

NOTE: You can reassign only scheduled and recurring jobs. You cannot reassign jobs that are completed, pending, in progress, or canceled.

To cancel one or more jobs:

1. Select **Monitor > Job Management**.

The Job Management page appears.

2. Select the jobs that you want to reassign. From the right-click or More menu, select **Reassign Jobs**.

The Reassign Jobs page appears, displaying the list of users to whom you can reassign the jobs.

3. Select the user to whom you want to reassign the jobs.

4. Click **OK** to reassign the jobs.

The Reassign Jobs Warning page appears asking you to confirm the reassignment.

NOTE: If the user to whom you have reassigned the jobs does not have the proper privileges, then a message indicating that the jobs cannot be reassigned because of role restrictions is displayed along with the list of jobs that cannot be reassigned. Click OK to close the page and go to the Job Management page.

5. Click **Confirm**.

You are returned to the Job Management page, and a status message about the reassignment is displayed at the top of the page.

Rescheduling and Modifying the Recurrence of Jobs in Security Director

You can reschedule a job and modify its recurrence from the Job Management page. You can reschedule and modify jobs only in the following cases:

- The job supports scheduling and recurrence, and it is currently in the Scheduled state.
- The schedule of a job in the Failed or Success state is a recurring job
- The job was created as a recurring job. This behavior is true for all scheduled jobs except the following:
 - Backing up configuration files
 - Backing up the MySQL and PostgreSQL database
 - Generating reports

To reschedule and modify the recurrence of jobs triggered by any user in Junos Space Platform, you must be assigned the privileges of a Job Administrator. However, you can reschedule or modify the recurrence settings of jobs that are scheduled by you.

To reschedule and modify the recurrence of a scheduled job:

1. Select **Monitor > Job Management**.

The Job Management page appears.

2. Select the jobs that you want to reschedule. From the right-click or More menu, select **Reschedule Job**.

The Reschedule Job page appears.

3. Modify the schedule and the recurrence settings for the job according to the guidelines provided in [Table 67 on page 172](#).

4. Click **OK** to reschedule the job.

You are returned to the Job Management page.

Table 67: Reschedule Job Settings

Setting	Guideline
Type	Specify whether the job should be run immediately or later. If you specify that the operation should be run later, you must specify a start date and time (in MM/DD/YYYY and HH:MM:SS 24-hour or AM/PM formats) for the job.
Recurrence	Specify whether the job should be done on a recurring basis.

Table 67: Reschedule Job Settings (*continued*)

Setting	Guideline
Repeat	<p>Specify the periodicity of the recurrence:</p> <ul style="list-style-type: none"> • Minutes • Hourly • Daily • Weekly • Monthly • Yearly
Every	Specify the period at which the job reschedule should recur. For example, if you specified a periodicity in hours (Hourly), enter the number of hours after which the job retry should recur.
On	<p>Specify one or more days on which you want the job to recur.</p> <p>NOTE: This field is displayed only when you specify a weekly periodicity (Weekly).</p>
Ends	<p>Specify one of the following:</p> <ul style="list-style-type: none"> • Select Never to continue (without an end date) the recurring operation at the specified recurrence interval. • Select On and specify a date and time on which to stop the recurring operation.
Summary	Displays a summary of the recurrence.

Retrying a Failed Job on Devices in Security Director

You can retry jobs that did not complete successfully on devices where they were configured to run from the Job Management page. Retrying a failed job allows you to save time because you do not need to create the job again and execute it, but can retry the failed job.

The following jobs can be retried if they fail:

- Deploy Configuration
- Discover Network Elements
- Reboot Devices
- Resynchronize Network Elements

To retry a job on the devices on which it failed:

1. Select **Monitor > Job Management**.

The Job Management page appears.

2. Select the job that you want to retry. From the right-click or More menu, select **Retry on failed devices**.

The Retry on *Job-Name* page appears, displaying the list of devices on which you can retry the job.

3. Specify the parameters for the job retry according to the guidelines provided in [Table 68 on page 174](#).

4. Click **OK** to retry the jobs.

The Job Details page appears displaying the details of the job.

5. Click **OK**.

You are returned to the Job Management page.

Table 68: Retry Job Settings

Setting	Guideline
Type	Specify whether the job should be run immediately or later. If you specify that the operation should be run later, you must specify a start date and time (in MM/DD/YYYY and HH:MM:SS 24-hour or AM/PM formats) for the job.
Recurrence	Specify whether the job should be done on a recurring basis. This field is displayed if the job was created as a recurring job.
Repeat	Specify the periodicity of the recurrence: <ul style="list-style-type: none"> • Minutes • Hourly • Daily (default) • Weekly • Monthly • Yearly

Table 68: Retry Job Settings (*continued*)

Setting	Guideline
Every	Specify the period at which the job retry should recur. For example, if you specified a periodicity in hours (Hourly), enter the number of hours after which the job retry should recur.
On	<p>Specify one or more days on which you want the job to recur.</p> <p>NOTE: This field is displayed only when you specify a weekly periodicity (Weekly).</p> <p>The day on which the retry is scheduled is disabled. For example, if you scheduled the retry on a Wednesday, then Wed is selected by default and disabled. You can select other days by enabling the corresponding check boxes.</p>
Ends	<p>Specify one of the following:</p> <ul style="list-style-type: none"> • Select Never to continue (without an end date) the recurring operation at the specified recurrence interval. • Select On and specify a date and time on which to stop the recurring operation.
Summary	Displays a summary of the recurrence.

Exporting the Details of a Job in Security Director

You export the details of a job if you want to view the details of a job in an external application or e-mail the information. You can export the details of the following jobs as a comma-separated values (CSV) file:

- Delete Device
- Export Physical Inventory
- Resync Network Elements
- Reboot Devices
- Discover Network Elements
- Upload RSA Keys

- Export View active configuration
- Resolve key conflict

To export the details of a job:

1. Select **Monitor > Job Management**.

The Job Management page appears.

2. Double-click the job for which you want to view the details. Alternatively, select the job and from the More or right-click menu, select **View Job Details**.

The Job Details page appears.

3. Click the Export icon.

After a few seconds, a dialog box pops up.

4. Select whether to open the file directly or save the file to your client.

5. Click **OK**.

The file is opened or saved depending on the option that you chose.

6. Click **OK**.

You are returned to the Job Management page.

Export audit logs	<p>Click the Export button to export audit logs as a comma-separated values (CSV) file. The Export Audit Log page appears displaying options for exporting the audit logs. See “Exporting Audit Logs in Security Director” on page 184.</p>

RELATED DOCUMENTATION

| [Using Job Management in Security Director | 163](#)

Understanding Audit Logs in Security Director

The Audit Logs feature in Security Director enables you to track login history, device management tasks, services that were provisioned on devices, and other user-initiated tasks. Tasks that are not initiated by users, such as device-driven activities like resynchronization of network elements, are not recorded in audit logs.

Administrators can use audit logs to review events. For example, administrators can identify the user accounts associated with an event, determine the chronological sequence of events—that is, what happened before and during an event—, and so on.

NOTE: Security Director also tracks all externally initiated non-READ REST APIs, and login and logout APIs.

Administrators can sort and filter audit logs. For example, administrators can use audit log filtering to track user accounts that were added on a specific date, track configuration changes across a particular type of

device, view services that were provisioned on specific devices, monitor user login and logout activities over time, and so on.

NOTE: To use the audit log service to monitor user requests and track changes initiated by users, you must be assigned the Audit Log Administrator role.

You can manage the volume of audit log data stored by purging log files from the Junos Space database without archiving them or by purging log files after archiving them. When you archive logs before purging them, the archived log files are saved in a single file in compressed comma-separated values (CSV) format (extension .csv.gz). Audit logs can be archived locally (on the active node in the Junos Space fabric) or to a remote server. When you archive data locally, the archived log files are saved in the `/var/lib/mysql/archive` directory on the active Junos Space node.

You can schedule the purging of audit logs (with or without prior archiving) for a later date and schedule the purging on a recurring basis.

You can export audit logs in CSV format without purging them from the system.

RELATED DOCUMENTATION

[Using Audit Logs in Security Director](#) | 179

Purging or Archiving and Purging Audit Logs in Security Director

Junos Space enables you to manage the volume of audit log data stored by purging log files from the Junos Space database without archiving them or by purging log files after archiving them. You can purge audit logs before a specified date and time or audit logs that are older than a specified number of days. Audit logs can be archived locally (on any node that is in the UP state) or to a remote server.

To archive and purge or only audit logs:

1. Select **Monitor > Audit Logs**.

The Audit Logs page appears.

2. Click the **Archive/Purge** button.

The Archive / Purge Audit Logs page appears.

- Specify the audit logs to be purged, or archived and purged, according to the guidelines provided in [Table 71 on page 182](#).

- Click **OK**.

The Audit Log Archive/Purge page appears asking you to confirm the purge, or archive and purge, operation.

- Click **Yes** to continue with the purge, or archive and purge, operation.

The Job Detail: Audit Log Archive/Purge page appears displaying the details of the job.

- Click **OK** to close the Job Details page..

You are returned to the Audit Logs page.

Table 71: Archive/Purge Audit Logs Settings

Setting	Guideline
Purge Logs	Specify a date and time (in MM/DD/YYYY and HH:MM:SS formats) before which audit logs should be purged or that audit logs that are older than a specified number of days should be purged. NOTE: You specify the time in the local time zone of the client computer but the audit logs are purged according to the time zone configured on the Junos Space server.
Purge audit logs from all accessible domains	Select this check box to purge audit logs from all domains to which you have access. By default, audit logs are purged only from a domain that you accessed, so this check box is cleared.
Archive logs before purge	Select this check box to archive audit logs before they are purged. This check box is selected by default. CAUTION: If you choose not to archive the audit logs before purging, the audit logs are deleted from the Junos Space database and cannot be recovered.
Archive Mode	Specify whether audit logs are archived locally (on the active node) or on a remote server.
Username	Enter a valid username of a user on the remote server. The username and password will be used to access the remote server.
Password	Enter a valid password of the user on the remote server.
Confirm Password	Reenter the password of the user on the remote server.

Table 71: Archive/Purge Audit Logs Settings (*continued*)

Setting	Guideline
Remote Server IP Address	Enter the IPv4 address of the remote server.
Remote Server Directory	<p>Enter the full path of the directory (ending with /) on the remote server where the audit logs will be archived.</p> <p>NOTE: The directory must already exist on the remote server.</p>
Type	<p>Specify whether the purge, or archive and purge, operation should be run immediately or later.</p> <p>If you specify that the operation should be run later, you must specify a start date and time (in MM/DD/YYYY and HH:MM:SS 24-hour or AM/PM formats) for the purge or archive and purge operation.</p>
Recurrence	<p>Specify whether the purge, or archive and purge, operation should be done on a recurring basis.</p> <p>NOTE: This field is enabled only when you specify (in the Purge Logs field) that audit logs that are older than a specified number of days should be purged.</p>
Repeat	<p>Specify the periodicity of the recurrence:</p> <ul style="list-style-type: none"> • Minutes • Hourly • Daily (Default) • Weekly • Monthly • Yearly
Every	Specify the period at which the purge should recur. For example, if you specified a periodicity in hours (Hourly), enter the number of hours after which the purge should recur.
On	<p>Specify one or more days on which you want the purge to recur.</p> <p>NOTE:</p> <ul style="list-style-type: none"> • This field is displayed only when you specify a weekly periodicity (Weekly). • The day on which the purge is scheduled is disabled. For example, if you scheduled a job on a Wednesday, then Wed is selected by default and disabled. You can select other days by enabling the corresponding check boxes.

Table 71: Archive/Purge Audit Logs Settings (*continued*)

Setting	Guideline
Ends	<p>Specify one of the following:</p> <ul style="list-style-type: none"> • Select Never to continue (without an end date) the recurring purge operation at the specified recurrence interval. • Select On and specify a date and time on which to stop the recurring purge operation.
Summary	Displays a summary of the recurrence.

Packet Capture

IN THIS CHAPTER

- [Packet Capture Overview | 188](#)
- [About the Packets Captured Page | 189](#)
- [Setting the Purge Policy | 191](#)

Packet Capture Overview

The packet capture tool captures IDP attack packets sent by SRX Series devices. It is installed as part of Security Director installation and runs on the Junos Space Network Management setup. You can use it to help you analyze network traffic and troubleshoot network problems.

Based on a preconfigured set of rules, SRX Series devices classify the packets as normal or an attack. When there is an attack, an SRX Series device sends the attack packets to the Junos Space Network Management Platform. You must configure the SRX Series device to send the attack packets to the Junos Space Network Management Platform.

Junos Space Network Management Platform runs a load balancer bound with a Virtual IP address. You must configure SRX Series devices with the Virtual IP address as the destination for forwarding captured packets. Junos Space Network Management Platform receives those packets and stores them. You can view the attack information and download packets that constitute the attack from the Security Director application.

The ports that are opened between the SRX Series devices and Security Director are:

- Port 2050 (UDP) - Used to receive attack packets sent by SRX series devices.
- Port 2051 (TCP) - Used by Security Director to fetch the attack packets stored in Junos Space Network Management Platform database.

For information on modifying the IPS configuration on SRX Series devices, see [“Modifying the IPS Configuration for Security Devices” on page 259](#).

NOTE: Packet capture is applicable only for IPS packets.

Network administrators and security engineers use packet capture to perform the following tasks:

- Monitor network traffic and analyze traffic patterns.
- Identify and troubleshoot network problems.
- Detect security breaches in the network, such as unauthorized intrusions, spyware activity, or ping scans.

This tool captures the entire packet, including the Layer 2 header, and saves the contents to the Junos Space Network Management Platform Database in .pcap format. You can download attack packets captured by SRX Series devices and analyze these packets externally using tools such as Wireshark, tcpdump, tshark, and so on.

NOTE: PCAPs can be suppressed by the log suppression mechanism, which is enabled by default. To disable log suppression, see [suppression](#). To configure SRX IDP packet capture, see [Configuring Security Packet Capture](#).

About the Packets Captured Page

To access this page, click **Monitor > Packet Capture**.

Use the Packets Captured page to view all the packets captured by SRX Series devices, and then download the attack packets.

Tasks You Can Perform

You can perform the following tasks from this page:

- Download the packets captured. Click **Download** to download the packet capture file. To download the attack packets from the Event Viewer, see [“Downloading Packets Captured” on page 52](#).
- Set purge policy. See [“Setting the Purge Policy” on page 191](#).
- View the attack details. See [“Viewing Policy and Shared Object Details” on page 532](#).
- Filter the packets based on attack name, date, and time of attack. Click the filter drop-down list and enter the filter criteria to filter the packets.

Field Descriptions

[Table 74 on page 190](#) provides guidelines on using the fields on the Packets Captured page. You can sort the attack packets in ascending or descending order based on attack name, system time, and attack time.

Table 74: Fields on the Packets Captured Page

Field	Description
Attack Name	Name of the attack packet.
Packets ID	ID of the captured packet.
Device IP	IP address of the SRX Series device that captured the packet.
System Time Stamp	Time when the system received the packet from the SRX Series device.
Attack Time Stamp	Time when the attack occurred.
Download	Link to download the packet capture file.

Setting the Purge Policy 191
Viewing Policy and Shared Object Details 532

Setting the Purge Policy

The purge policy enables you to purge the attack packets from the database based on the configured days or the storage space. Junos Space Security Director deletes packets when either of the conditions is met. You can set the purge policy based on the time and storage.

To set the purge policy:

1. Select **Monitor > Packet Capture**.

The Packets Captured page is displayed.

2. Click **Purge**.

The Set Purge Policy page is displayed.

3. Enter the details according to the guidelines in [Table 75 on page 191](#).

4. Click **OK**.

Table 75: Purge Policy Setting

Field	Description
Time-based policy (days)	Number of days an attack entry is available in the database. The default number of days is 60.
Storage-based policy (MB)	Maximum space that the database can occupy. The default storage space is 500 MB.

NOTE: Cleanup takes place once every day at 1 AM.

NSX Inventory-Security Groups

IN THIS CHAPTER

- About the Security Groups Page | 192
- Viewing Members of a Security Group | 193

About the Security Groups Page

To access this page, select Security Director > Monitor > NSX Inventory > Security Groups.

Use the Security Groups page to view a list of security groups obtained from NSX and the corresponding dynamic address groups created by Security Director.

The security groups updates are automatically synchronized by Security Director. By default, the resynchronization interval is set to 3 hours. You can modify the interval time by editing the application configuration file in the Policy Enforcer VM at `/etc/nsxmicro/conf/application.conf`. In the configuration file, modify `nsx_resync_interval = <value in seconds>` [default is set to 3 hours, 3*60*60].

Run the command **service nsxmicro restart** to restart the NSX micro service to load the new resynchronization interval.

Tasks You Can Perform

You can perform the following task from this page:

- View members of the security group.

Field Descriptions

[Table 76 on page 193](#) provides guidelines on using the fields on the Security Groups page.

Table 76: Fields on the Security Groups Page

Field	Description
NSX Manager	Specifies the name of the NSX Manager from which the corresponding security group is obtained.
Name	Specifies the name of the security group.
Members	Click View to view the list of VMs belonging to a security group. If the vCenter is associated with the NSX Manager, the members list shows the VM names with IPv4 and IPv6 addresses.
DAG Name	Specifies the name of a dynamic address group created for each security group. The dynamic address group name is created in the format <i><NSX Manager name>-<security group name></i> .
Definition	Specifies the definition of a security group.

Deploying the vSRX as an Advanced Security Service in a VMware NSX Environment | 331

Viewing Members of a Security Group

Use the View Members page to view the list of VMs belonging to a security group.

To view the list of virtual machines:

1. Select **Monitor > NSX Inventory > Security Groups**.

The Security Groups page appears.

2. In the Members column, click **View**.

The View Members page appears. [Table 77 on page 194](#) describes the fields on this page.

Table 77: Fields on the View Members Page

Field	Description
Security Group	Specifies the name of the security group.
VM Name	Specifies the name of the VM that belongs to the security group.
IP Address	Specifies the IPv4 address of the VM.
IPv6 Address	Specifies the IPv6 address of the VM.

About the Virtual Machines Page

To access this page, select Security Director > Monitor > vCenter Server Inventory > Virtual Machines.

Use the Virtual Machines page to view the complete list of VMs that are dynamically fetched by the associated vCenter.

Tasks You Can Perform

You can perform the following tasks from this page:

- View security groups associated with each VM.
- View a list of vNICs for each VM and the network that each of vNIC is linked to.

Field Descriptions

Table 78 on page 195 provides guidelines on using the fields on the Virtual Machines page.

Table 78: Fields on the Virtual Machines Page

Field	Description
VM Name	Specifies the name of the VM.
vCenter	Specifies the vCenter details.

Table 78: Fields on the Virtual Machines Page (*continued*)

Field	Description
OS on VM	Specifies the operating system on each VM. For example: Red Hat, CentOS, and so on.
Security Groups	Click View to view a list of security groups associated with each VM.
Network Details	Click View to view a list of vNICs for each VM with their corresponding IPv4 and IPv6 addresses.
State	Specifies whether the VM is switched on or off.
Status	Specifies whether the VM is connected to the ESXi host or not.

Using Features in Security Devices

Use the Security Devices page to view the devices managed by Junos Space Security Director.

Before You Begin

- Read the [“Security Devices Overview” on page 203](#) topic.
- Review the Security Devices main page for an understanding of the existing devices. See [“Security Devices Main Page Fields” on page 288](#) for field descriptions.

Using the Security Devices Page

To use the Security Devices page:

1. Select **Devices > Security Devices**.
The Security Devices page appears.
2. Use the guidelines provided in [Table 81 on page 200](#) to learn about the page.

Table 81: Security Devices Page Actions

Action	Guideline
View the details of a device	Right-click a device and select View Device Details from the shortcut menu, or click the Detailed View icon, which appears when you mouse over a device entry, to view the details of that device. The Device Detail page appears displaying the basic information about the device, the services on the device, the device status, and monitoring information. See “Viewing Security Device Details” on page 288 .

Table 81: Security Devices Page Actions (continued)

Action	Guideline
Update Changes	Select one or more devices and click Update Changes to update all security-specific configurations or pending services on the selected devices. The Update page appears. See “Updating Security-Specific Configurations or Services on Devices” on page 203.
Resynchronize with Network	Select the devices that you want to resynchronize. Click the Resynchronize with Network button, or from the More or right-click menu, select Operations > Resynchronize with Network . The Resynchronize Devices page appears. See “Resynchronizing Managed Devices with the Network in Security Director” on page 204.
Upload Keys	Click the Upload Keys button to upload authentication keys to the devices. See “Uploading Authentication Keys to Devices in Security Director” on page 206.
Modify Configuration	Select one or more devices and, from the More or shortcut menu, select Configuration > Modify Configuration to modify the configuration on the selected device. The Modify Configuration page appears. See “Modifying the Configuration of Security Devices” on page 208.
View Active Configuration	Select one or more devices. From the More or right-click menu, select Configuration > View Active Configuration . The View Active Configuration page appears. See “Viewing the Active Configuration of a Device in Security Director” on page 269.
Preview Configuration	Select a device and, from the More or shortcut menu, select Configuration > Modify Configuration and then click Preview Configuration to preview the configuration changes that will be pushed to the security device. You can preview the changes in either CLI or XML format. See “Previewing Device Configurations” on page 283.
Delete Devices	Select one or more devices. From the More or right-click menu, select Operations > Delete Devices to delete the selected devices. The Delete Devices page appears. See “Deleting Devices in Security Director” on page 271.
Reboot Devices	Select the devices that you want to reboot. From the More or right-click menu, select Operations > Reboot Devices . The Reboot Devices page appears. See “Rebooting Devices in Security Director” on page 272.
Resolve Key Conflict	To resolve key conflicts on one or more devices, select the devices. From the More or right-click menu, select Operations > Resolve Key Conflict . The Resolve Key Conflict page appears. See “Resolving Key Conflicts in Security Director” on page 273. NOTE: This menu entry is enabled only if a device has a key conflict.

Table 81: Security Devices Page Actions (*continued*)

Action	Guideline
Launch Device WebUI	To access the device WebUI of the device to manage it directly, select the device for which you want to launch the Web UI. From the More or right-click menu, select Access > Launch Device WebUI . The Juniper Web Device Manager page appears in a separate browser tab or window. See “Launching a Web User Interface of a Device in Security Director” on page 274 .
SSH To Device	Select the device to which you want to connect. From the More or right-click menu, select Access > SSH to Device . The SSH to Device page appears. See “Connecting to a Device by Using SSH in Security Director” on page 275 .
Device Change	<p>Select a device and, from the More or shortcut menu, select Device Change to do the following tasks:</p> <ul style="list-style-type: none"> • Select Import Device Change to import out-of-band changes, which are made on the device and managed by Security Director. See “Importing Device Changes” on page 278. • Select View Device Change to check the status of the security configuration changes, either in CLI or XML format. See “Viewing Device Changes” on page 279. <p>These changes are made on the device and managed by Security Director.</p>
View Inventory Details	<p>To view the physical inventory, and physical and logical interfaces, on the device, select one or more devices, and from the More or right-click menu, select View Inventory Details.</p> <p>The subsequent page appears with the Physical Inventory tab highlighted. See “Viewing and Exporting Device Inventory Details in Security Director” on page 280.</p>
Import Configuration	Select a device and, from the More or shortcut menu, select Import to import firewall, NAT, and IPS policies from a security device to Security Director. Resolve any conflicts, if needed. See “Importing Security Policies to Security Director” on page 277 .
Refresh Certificate	Select a device and, from the More or shortcut menu, select Refresh Certificate for device certificate synchronization. See “Refreshing Device Certificates” on page 284 .
Assign Device to Domain	To assign devices to a domain, select one or more devices and, from the More or shortcut menu, select Assign Device to Domain . See “Assigning Security Devices to Domains” on page 285 .
Acknowledge Device Fingerprint	<p>To acknowledge the SSH fingerprints received from the device or resolve any SSH fingerprint conflicts between the fingerprints stored in the Junos Space database and that on the device, select one or more devices. From the More or right-click menu, select Acknowledge Device Fingerprint. See “Acknowledging Device SSH Fingerprints in Security Director” on page 286.</p> <p>NOTE: This menu entry is visible only when a device has a fingerprint conflict.</p>

Security Devices Overview

You can use Junos Space Security Director to simplify the management of security devices running Junos OS. If you have multiple devices in your network, you can manage them in one place from the Security Devices page.

To manage devices using Security Director, you must first discover the devices by using the Device Discovery workflow. After you discover your devices, you can manage them using the Security Devices page. You can view information about the device such as the device schema version, CPU and storage, and different status information for the device. For more information, see [“Security Devices Main Page Fields”](#) on page 288.

You can also perform various actions such as uploading keys, modifying the device configuration, updating devices, viewing and importing device changes, viewing the inventory details, and so on. See [“Using Features in Security Devices”](#) on page 200.

Updating Security-Specific Configurations or Services on Devices

You can update all security-specific configurations or pending multiple services on the selected devices.

To update the changes:

1. Select **Devices > Security Devices**.
2. Select a device and then click **More**.
3. Click **Update Changes**.

The Update page appears.

You can also right-click the selected device and select **Update Changes**.

4. Enable policy rematch to allow the firewall to keep its existing sessions during a policy update from Security Director.
5. Enable the required service types to update the selected policies on the device. For example, enable Firewall Policy to update the firewall policies on the device.
6. Select Run now to update the configuration or pending services on the selected device at that time.
7. Select Schedule at a later time to update the configuration or pending services on the selected device at the specified time. Complete the following tasks:
 1. Choose a date from the date picker by clicking the date picker icon.
 2. Enter the time.
 3. Select the time format from the drop-down menu.
8. Click **Update**.

All the security-specific configurations or pending services on the selected devices are updated.

Resynchronizing Managed Devices with the Network in Security Director

You can manually resynchronize a managed device at any time. When you resynchronize a managed device, the configuration changes made on the device are synchronized with the Junos Space database. For example, when a managed device is updated by a device administrator using the CLI or the GUI of the device and you trigger a manual resynchronization, the device configuration in the Junos Space database is synchronized with the configuration on the physical device.

To resynchronize one or more devices:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices that you want to resynchronize. Click the **Resynchronize with Network** button, or from the More or right-click menu, select **Operations > Resynchronize with Network**.

The Resynchronize Devices page appears listing the devices to be resynchronized.

3. Click **OK** to confirm the resynchronization.

The Job Details: Resync Network Elements page appears pops up displaying details of the resynchronization job.

4. Click **OK** to close the Job Details page.

You are returned to the Security Devices page.

Performing Commit Check

You can verify the syntax of the configuration changes for firewall, NAT, IPS, VPN, and APBR before the configuration is pushed to the security devices.

To perform commit check on one or more devices:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select one or more devices and click **Commit Check** button.

The Commit Check page appears.

NOTE: If you select a device with connection status as up, configuration status as In sync, and pending service as some valid service, then only commit check will be enabled for a device.

3. Enable the service types for which you want to execute the commit check.

4. Click **OK** to complete the commit check.

The Job Details page appears with the status of commit check for the first device in the grid.

5. Click **OK** to close the Job Details page.

NOTE: To check the job details for commit check on all the selected devices, select **Monitor > Job Management**. The devices with no pending services shows the state as failure.

Uploading Authentication Keys to Devices in Security Director

You can authenticate a device by using credentials (username and password) or by key-based authentication. Junos Space supports RSA keys for key-based authentication. In the Security Devices page, you can upload authentication keys to one or more devices.

NOTE: You can generate the authentication keys from the Fabric page in the Administration workspace of Junos Space Network Management Platform.

To upload authentication keys to one or more devices:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. From the More or right-click menu, select **Upload Keys**.

The Upload Keys page appears.

3. Specify the parameters for uploading keys according to the guidelines provided in [Table 82 on page 207](#).

4. Click **OK** to confirm the key upload.

The Job Details: Upload RSA keys page appears, displaying details of the uploaded job.

5. Click **OK** to close the Job Details page.

You are returned to the Security Devices page.

Table 82: Upload Keys Settings

Setting	Guideline
<i>Upload Keys</i>	
Upload Type	<p>Specify how you want to upload keys:</p> <ul style="list-style-type: none"> • Select Add Manually to add the device details and authentication keys manually. • Select Import from CSV to import the device details and authentication keys from a comma-separated values (CSV) file. <p>Click the CSV Sample link to view or download a sample CSV file.</p>

Modifying the Configuration of Security Devices

You can use the Modify Configuration page to modify the configuration of one or more managed devices. You cannot modify the configuration of unmanaged devices, devices of the TCA Series family, and devices with the configuration status “waiting for deployment.”

To modify the configuration of one or more security devices:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices whose configuration you want to modify.

3. From the More or right-click menu, select **Configuration > Modify Configuration**.

The Modify Configuration page appears with the Basic Setup section selected by default. See [Table 83 on page 210](#) for the configurations that you can modify.

NOTE: Depending on whether you selected one device or more than one device, the configuration that you can modify differs. If you select only one device, all sections can be modified. If you select more than one device, only the Basic Setup, Syslog, and Security Logging sections can be modified; in addition, configuration parameters that are unique to the device, such as hostname, cannot be modified.

4. After you have modified the configuration, you can perform the following actions:

- Click the **Save** button to save the configuration changes that you made. The changes that you made are saved to the Junos Space database and you are returned to the Security Devices page.
- Click the **Preview Changes** button to preview the changes that you made. The Preview Configuration Changes page appears with the CLI tab selected by default. The CLI tab displays the Junos OS commands corresponding to the changes that you made. For an XML view of the configuration, click the **XML** tab. Click **Close** to close the page and you are returned to the Modify Configuration page.
- Click the **Save and Deploy** button to save the configuration changes and deploy the saved configuration to the device.

- If the configuration was not modified, the Deploy Configuration page appears displaying a message indicating that no changes were made. Click **OK** to close the page.

You are returned to the Modify Configuration page.

- If the configuration was modified, then the changes are saved to the Junos Space database and the Deploy Configuration page appears.
 - In the **Type** field, specify whether you want to deploy the configuration immediately or deploy the configuration later. If you choose to deploy the configuration later, you must specify a date and time in the DD/MM/YYYY HH:MM:SS AM/PM/24-hour formats.
 - Click **OK**.

The Job Details: Deploy Configuration page appears displaying the details of the job.

- Click **OK** to close the Job Details page.

You are returned to the Security Devices page.

- Click **Cancel** to discard the configuration changes that you made. The changes are discarded and you are returned to the Security Devices page.

Table 83: Modify Configuration

Modifying the Basic Configuration for Security Devices

You can use the Basic Setup section on the Modify Configuration page to modify the basic configuration for a device. You can modify settings related to hostname and device name, system time, basic protocols, users, DNS, and SNMP.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/p for a particular release and device. There you can find detailed information on the configuration parameters for that

To modify the basic configuration:

- 1. Select **Devices > Security Devices**.

The Security Devices page appears.

- 2. Select the devices whose configuration you want to modify.

- 3. From the More or right-click menu, select **Configuration > Modify Configuration**.

The Modify Configuration page appears with the Basic Setup section selected by default.

- 4. Modify the configuration according to the guidelines provided in [Table 84 on page 211](#).

- 5. After modifying the configuration, you can cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 84: Basic Setup

If the fields entered are valid, a DNS server is created and a confirmation message is displayed at the top of the Modify Configuration page. • Delete DNS servers—Select one or more DNS servers and click the X icon to delete the DNS servers. The Warning page appears. Click Yes to confirm the deletion. The selected DNS servers are deleted.
<i>SNMP</i>	
Location	Specify the location where the device is physically located.

Table 84: Basic Setup (*continued*)

Setting	Guideline
Community	<p>Existing SNMP communities are displayed in a table with the name and authorization for each community. You can perform the following actions:</p> <ul style="list-style-type: none"> • Add an SNMP community— <ol style="list-style-type: none"> 1. Click + to add an SNMP community on the device. The Add SNMP Community page appears. 2. Specify the following fields: <ul style="list-style-type: none"> • Name—Specify the name of the SNMP community string. • Authorization—Select the authorization for the SNMP community. If you select read-only, the user can read the information from the device by using the SNMP GET command. If you select read-write, in addition to reading the information, the user can also modify the configuration on the device using the SNMP SET command. 3. Click OK. If the fields entered are valid, an SNMP community is created and a confirmation message is displayed at the top of the Modify Configuration page. • Modify an SNMP community—Select an SNMP community and click the pencil icon to modify the settings. The Edit SNMP Community page appears, showing the same fields that are presented when you create an SNMP community. You can modify some of the fields on this page. See the preceding bullet for an explanation of the fields. • Delete SNMP community entries—Select one or more SNMP community entries and click the X icon to delete the communities. The Warning page appears. Click Yes to confirm the deletion. The selected SNMP communities are deleted.

Table 84: Basic Setup (*continued*)

Setting	Guideline
Trap Target	<p>Existing SNMP trap groups are displayed in a table with the name and category for each trap group. You can perform the following actions:</p> <ul style="list-style-type: none"> • Add an SNMP trap group— <ol style="list-style-type: none"> 1. Click + to add an SNMP trap group on the device. The Add SNMP Trap Group page appears. 2. In the Name field, specify the name of the SNMP trap group. 3. Select the SNMP trap types or categories to be associated with the trap group. 4. Click OK. If the fields entered are valid, an SNMP trap group is created and a confirmation message is displayed at the top of the Modify Configuration page. • Modify an SNMP trap group—Select an SNMP trap group and click the pencil icon to modify the settings. The Edit SNMP Trap Group page appears, showing the same fields that are presented when you create an SNMP trap group. You can modify some of the fields on this page. See the preceding bullet for an explanation of the fields. • Delete SNMP trap groups—Select one or more trap groups and click the X icon to delete the trap groups. The Warning page appears. Click Yes to confirm the deletion. The selected SNMP trap group are deleted.

Table 85: Add NTP Server Settings

Setting	Guideline
Name	Specify the name or IP address of the remote NTP server.
Key	Specify the key number used to encrypt authentication fields in all packets sent to the NTP server.
Version	Specify the version number used in outgoing NTP server packets.
Prefer	Specify the NTP server as the preferred server if you configured more than one.

Table 86: Add User Settings

Setting	Guideline
Username	Enter the username of the user (up to 64 characters) on the device.

Table 86: Add User Settings (*continued*)

Setting	Guideline
User ID	<p>Enter a user ID, which is a numeric identifier that is associated with the username.</p> <p>If you do not assign a user ID to a username, the system automatically assigns one when the configuration is pushed to the device.</p> <p>Range: 100 through 64,000.</p>
Full Name	Enter the full name of the user on the device; all alphanumeric characters are allowed except colon (:).
Password	Enter a password that is a minimum of six characters long and that must contain at least one uppercase letter, one lowercase letter, one number, and one special character.
Confirm Password	Re-enter the password for confirmation purposes.
Login Type	<p>Select the login type of the user, which defines the access privileges for a user. The following login types are available:</p> <ul style="list-style-type: none"> • Super-user—All permissions. • Operator—Clear, network, reset, trace, and view permissions. • Read-only—View permissions. • Unauthorized—No permissions. • Wheel—Custom or vendor-specific login type.

Modifying the Static Routes Configuration for Security Devices

You can use the Static Routes section on the Modify Configuration page to view, create, edit, or delete static routes on the device. You can activate or deactivate a static route or toggle the status of one or more static routes.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/p for a particular release and device. There you can find detailed information on the configuration parameters for that

To modify the static routes configuration:

- 1. Select **Devices > Security Devices**.

The Security Devices page appears.

- 2. Select the devices whose configuration you want to modify.

- 3. From the More or right-click menu, select **Configuration > Modify Configuration**.

The Modify Configuration page appears.

- 4. Click the **Static Routes** link in the left-navigation menu.

The Static Routes section on the Modify Configuration page is displayed. The existing static routes are displayed in a table. The actions that you can perform in this page are provided in [Table 87 on page 217](#).

- 5. After modifying the configuration, you can cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 87: Static Routes Actions

Action	Guideline
Create a static route	<p>Click the + icon to create a static route.</p> <p>The Create Static Route page appears. Complete the configuration according to the guidelines provided in Table 88 on page 218 and click OK.</p> <p>The static route is created and you are returned to the Static Routes section on the Modify Configuration page.</p> <p>NOTE: You must configure either a next hop or a next table for each static route that you configure.</p>

Table 87: Static Routes Actions (*continued*)

Action	Guideline
Modify a static route	<p>Select a static route and click the pencil icon.</p> <p>The Edit Static Route page appears, showing the same fields that are presented when you create a static route. You can modify some of the fields on this page. See Table 88 on page 218 for an explanation of the fields. After you have modified the static route, click OK.</p> <p>The changes are saved and you are returned to the Static Routes section on the Modify Configuration page.</p>
Delete static routes	<p>Select one or more static routes and click the X icon to delete the routes.</p> <p>The Warning page appears. Click Yes to confirm the deletion. The selected static routes are deleted.</p>
Activate static routes	<p>Select one or more deactivated static routes. From the More or right-click menu, select Activate.</p> <p>The static routes are activated and their status is changed to Activated.</p>
Deactivate static routes	<p>Select one or more activated static routes. From the More or right-click menu, select Deactivate.</p> <p>The static routes are deactivated and their status is changed to Deactivated.</p>
Toggle the status of a static route	<p>Select one or more static routes. From the More or right-click menu, select Toggle.</p> <p>The activated static routes are deactivated and the deactivated static routes are activated.</p> <p>NOTE: The Toggle option is enabled only when the selected static routes are a mix of activated and deactivated records.</p>

Table 88: Create Static Route Settings

Setting	Guideline
<i>Basic Information</i>	
	Select the type of IP address (IPv4 or IPv6).
IP Address	Enter the IPv4 or IPv6 address depending on the type of IP address specified.
Subnet	Enter the subnet for the IPv4 address or the prefix for the IPv6 address.

Table 88: Create Static Route Settings (*continued*)

Setting	Guideline
<i>Next Hop</i>	
Next Hop	<p>You can perform the following actions in this field:</p> <ul style="list-style-type: none"> • Add a next hop— <ol style="list-style-type: none"> 1. Click + to add a next hop on the device. The Create Next Hop page appears. 2. Complete the configuration according to the guidelines provided in Table 89 on page 220. 3. Click OK. If the fields entered are valid, a next hop is created the entry is displayed in the table. • Modify next hop settings—Select a next hop and click the pencil icon to modify the settings. The Edit Next Hop page appears, showing the same fields that are presented when you create a next hop. See Table 89 on page 220 for an explanation of the fields. • Delete next hop entries—Select one or more next hops and click the X icon to delete the next hops. The Warning page appears. Click Yes to confirm the deletion. The selected next hop entries are deleted.
<i>Qualified Next Hop</i>	
	<p>You can perform the following actions in this field:</p> <ul style="list-style-type: none"> • Add a next hop— <ol style="list-style-type: none"> 1. Click + to add a qualified next hop on the device. The Create Qualified Next Hop page appears. 2. Complete the configuration according to the guidelines provided in Table 90 on page 221. 3. Click OK. If the fields entered are valid, a qualified next hop is created the entry is displayed in the table. • Modify qualified next hop settings—Select a qualified next hop and click the pencil icon to modify the settings. The Edit Qualified Next Hop page appears, showing the same fields that are presented when you create a qualified next hop. See Table 90 on page 221 for an explanation of the fields. • Delete qualified next hop entries—Select one or more qualified next hops and click the X icon to delete the qualified next hops. The Warning page appears. Click Yes to confirm the deletion. The selected qualified next hop entries are deleted.
<i>Next Table</i>	

Table 88: Create Static Route Settings (*continued*)

Setting	Guideline
Next Table	Select the name of next routing table to the destination.
<i>Advanced Options</i>	
Preference	Enter a preference for the next hop; the lower the number the higher the route preference. Range: 0 through 2,147,483,647
Metric	Enter a metric value, which signifies the cost for an access route, for the next hop. Range: 0 through 2,147,483,647
Discard	Specify that packets addressed to this destination are dropped and ICMP (or ICMPv6) unreachable messages are not sent to the originator of the packet.
Resolve Choices	Specify whether indirectly-connected next hops should be resolved (Resolve) or not (No Resolve). Select None if no action is required.
Retain Choices	Specify whether the route should be deleted from the forwarding table (No Retain) or retained (Retain) when the routing protocol process shuts down normally. Select None if no action is required.
Install Choices	Specify whether the route should be installed in the forwarding table or not. Select None if no action is required.
Readvertise Choices	Specify whether the route should be readvertised by routing protocols or not. Select None if no action is required.

Table 89: Create Next Hop Settings

Setting	Guideline
	Specify the next hop as an IP address or an interface name.
IP Address	Enter an IPv4 or IPv6 address for the next hop depending on the type of IP address specified for the static route.
Interface	Select the interface name to be used as the next hop.

Table 90: Create Qualified Next Hop Settings

Setting	Guideline
	Specify the qualified next hop as an IP address or an interface name.
IP Address	Enter an IPv4 or IPv6 address for the qualified next hop depending on the type of IP address specified for the static route.
Interface	Select the interface name to be used as the qualified next hop.
Preference	Enter a preference for the qualified next hop; the lower the number the higher the route preference. Range: 0 through 2,147,483,647
Metric	Enter a metric value, which signifies the cost for an access route, for the qualified next hop. Range: 0 through 2,147,483,647

Modifying the Routing Instances Configuration for Security Devices

You can use the Routing Instances section on the Modify Configuration page to view, create, edit, or delete routing instances on the device. You can activate or deactivate a routing instance or toggle the status of one or more routing instances.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/product/) for a particular release and device. There you can find detailed information on the configuration parameters for that device.

To modify the routing instances configuration:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices whose configuration you want to modify.

3. From the More or right-click menu, select **Configuration > Modify Configuration**.

The Modify Configuration page appears.

4. Click the **Routing Instances** link in the left-navigation menu.

The Routing Instances section on the Modify Configuration page is displayed. The existing routing instances are displayed in a table. The actions that you can perform in this page are provided in [Table 91 on page 222](#).

5. After modifying the configuration, you can cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 91: Routing Instances Actions

Action	Guideline
Create a routing instance	<p>Click the + icon to create a routing instance.</p> <p>The Create Routing Instance page appears. Complete the configuration according to the guidelines provided in Table 92 on page 223 and click OK.</p> <p>The routing instance is created and you are returned to the Routing Instances section on the Modify Configuration page.</p>
Modify a routing instance	<p>Select a routing instance and click the pencil icon.</p> <p>The Edit Routing Instance page appears, showing the same fields that are presented when you create a routing instance. You can modify some of the fields on this page. See Table 92 on page 223 for an explanation of the fields. After you have modified the routing instance, click OK.</p> <p>The changes are saved and you are returned to the Routing Instances section on the Modify Configuration page.</p>
Delete routing instances	<p>Select one or more routing instances and click the X icon to delete the routes.</p> <p>The Warning page appears. Click Yes to confirm the deletion. The selected routing instances are deleted.</p>

Table 91: Routing Instances Actions (*continued*)

Action	Guideline
View or configure static routes for an existing routing instance	View or configure static routes for the routing instance by clicking the view/configure link in the Static Route column. The Static Routes page appears. The field and actions on this page are the same as the ones in the Static Routes section on the Modify Configuration page. See “Modifying the Static Routes Configuration for Security Devices” on page 216 .
Activate routing instances	Select one or more deactivated routing instances. From the More or right-click menu, select Activate . The routing instances are activated and their status is changed to Activated .
Deactivate routing instances	Select one or more activated routing instances. From the More or right-click menu, select Deactivate . The routing instances are deactivated and their status is changed to Deactivated .
Toggle the status of a routing instance	Select one or more routing instances. From the More or right-click menu, select Toggle . The activated routing instances are deactivated and the deactivated routing instances are activated. NOTE: The Toggle option is enabled only when the selected routing instances are a mix of activated and deactivated records.

Table 92: Create Routing Instance Settings

Setting	Guideline
Name	Enter a name for the routing instance; no special characters are allowed and the keyword <i>default</i> cannot be used. The routing instance name must be unique and must contain a corresponding IP unicast table.
Description	Enter a description for the routing instance. We recommend that you enter a maximum of 255 characters.
Instance type	Specify the type of routing instance from the list. Select virtual-router for non-VPN-related applications and forwarding for filter-based forwarding applications where interfaces are not associated with instances.
Interfaces	From the interfaces displayed in the Available column, select one or more interfaces to associate with the routing instance. Interfaces will be displayed only when instance type is virtual-router.

Modifying the Syslog Configuration for Security Devices

You can use the Syslog section on the Modify Configuration page to view and modify the parameters related to system logging on the device.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/p for a particular release and device. There you can find detailed information on the configuration parameters for that

To modify the system log parameters:

1. Select **Devices > Security Devices**.
The Security Devices page appears.
2. Select the devices whose configuration you want to modify.
3. From the More or right-click menu, select **Configuration > Modify Configuration**.
The Modify Configuration page appears.
4. Click the **Syslog** link in the left-navigation menu.
The Syslog section on the Modify Configuration page is displayed.
5. Modify the configuration according to the guidelines provided in [Table 98 on page 229](#).
6. After modifying the configuration, you can cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 98: Syslog Settings

Setting	Guideline
<i>General Settings</i>	
Time Format	<p>Specify whether the time format should be included in system log messages generated for the device. By default, the timestamp specifies the month, day, hour, minute, and second at which the message was logged.</p> <p>If you select Enable, you can specify whether the milliseconds are included in the timestamp, the year is included in the timestamp, or both the milliseconds and the year are included in the timestamp.</p>

Table 98: Syslog Settings (*continued*)

Setting	Guideline
Source Address	Specify the IPv4 or IPv6 address to be used as the source address that is included in system log messages.
Log Rotation Frequency	Configure the time interval (in minutes) at which Junos Space checks for the system log file size. When the log file size exceeds the previously specified size limit, the log file is archived and a new log file is created. The range is 1 through 59 and the default is 15 minutes.
Allow Duplicates	Select this check box if you do not want to suppress syslog messages that were logged earlier. This check box is cleared by default.

Host Configuration

	<p>The existing host configuration entries are displayed in a table. You can perform the following actions:</p> <ul style="list-style-type: none"> Click the + icon to configure the facility and severity levels of messages to be logged in the remote destination. The Create Contents page appears. Complete the configuration according to the guidelines provided in Table 102 on page 236 and click OK. The system log message's facility and severity levels are created and you are returned to the Create Host Configuration page. Select an entry and click the pencil icon to modify the facility and severity levels of messages to be logged in the remote destination. The Edit Contents page appears showing the same fields that are presented when you configure the facility and severity levels of messages to be logged in the remote destination. Refer to Table 102 on page 236 for an explanation of the fields. After you have modified the system log message's facility and severity levels that are associated with the host, click OK. The changes are saved and you are returned to the Create Host Configuration page. Select one or more configured facility and severity levels, and click the X icon to delete the entries. The Warning page appears. Click Yes to confirm the deletion. The selected facility and severity levels are deleted.
<i>Advanced Options</i>	
Allow Duplicates	Select this check box if you want to allow repeated messages in the system log output. By default, this check box is cleared, which means that repeated messages are not logged in the output.
Explicit Priority	Select this check box to include the priority, which is a combination of the facility and severity, in syslog messages.
Facility Override	Specify an alternative facility that will replace the default facility used when messages are directed to a remote destination. For more information, see the https://www.juniper.net/documentation/en_US/junos/topics/reference/general/syslog-facilities-remote-logging.html topic.
Log Prefix	Specify the prefix to be used for all syslog messages for the specified host.
Source Address	Specify the IPv4 or IPv6 address to be used as the source address that is included in system log messages for the host.
Port	Specify the port number for the remote syslog folder. The range is 0 through 65,535 and the default is 514.

Table 99: Create Host Configuration Settings (*continued*)

Setting	Guideline
Structured Data	<p>Select this check box to log messages to a file in structured-data format instead of the standard Junos OS format. The structured-data format complies with IETF RFC 5424. By default, this check box is selected.</p> <p>Select the Brief check box to suppress the English language text that appears by default at the end of a message to describe the error or event. By default this check box is cleared.</p>

Table 100: Create File Configuration Settings

Setting	Guideline
Name	Enter the name of the file in which the data should be logged. The filename must not contain spaces, and it can contain some special characters (\$ ^ < > @ # ! * - = _ .).
Match	Enter a regular expression up to a maximum of 255 characters that must appear or must not appear in a message for the messages to be logged to a file.

Contents

The table displays the existing facility and severity configured for system log messages. You can perform the following actions:

- Click the + icon to configure the facility and severity levels of messages to be logged in the remote destination.

The Create Contents page appears.

Complete the configuration according to the guidelines provided in [Table 102 on page 236](#) and click **OK**.

The system log message's facility and severity levels are created and you are returned to the Create File Configuration page.

- Select an entry and click the pencil icon to modify the facility and severity levels of messages to be logged in the remote destination.

The Edit Contents page appears showing the same fields that are presented when you configure the facility and severity levels of messages to be logged in the remote destination. Refer to [Table 102 on page 236](#) for an explanation of the fields.

After you have modified the system log message's facility and severity levels that are associated with the file, click **OK**.

The changes are saved and you are returned to the Create File Configuration page.

- Select one or more configured facility and severity levels, and click the X icon to delete the entries. The Warning page appears. Click **Yes** to confirm the deletion. The selected facility and severity levels are deleted.

Advanced Options

Allow Duplicates	Select this check box if you want to allow repeated messages in the system log output. By default, this check box is cleared, which means that repeated messages are not logged in the output.

Table 102: Create Contents Settings

Setting	Guideline
Facility	Select the facility to which the system log message belongs. Each system log message belongs to a facility, which categorizes messages based on the source by which they are generated, such as a software process, or that relate to a similar condition or activity, such as authentication attempts.
Severity	Select the severity level for the system log message. Each system message is pre-assigned a severity level, which indicates how seriously the triggering event affects routing platform functions. When you configure logging for a facility and destination, you specify a severity level for each facility.

Modifying the Security Logging Configuration for Security Devices

You can use the Security Logging section on the Modify Configuration page to view and modify the parameters related to security logging on the device.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/p for a particular release and device. There you can find detailed information on the configuration parameters for that

To modify the system log parameters:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices whose configuration you want to modify.

3. From the More or right-click menu, select **Configuration > Modify Configuration**.

The Modify Configuration page appears.

4. Click the **Security Logging** link in the left-navigation menu.

The Security Logging section on the Modify Configuration page is displayed.

5. Modify the configuration according to the guidelines provided in [Table 103 on page 238](#).

6. After modifying the configuration, you can cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 103: Security Logging Settings

Setting	Guideline
<i>General Settings</i>	
Mode	<p>Select how security logs are processed and exported:</p> <ul style="list-style-type: none"> • Stream—Specify that security logs are processed directly in the forwarding plane. • Event—Specify that security logs are processed directly in the control plane.
Source Address	Specify the IPv4 or IPv6 address to be used as the source address when exporting security logs.
Format	<p>Specify the security log format for the device:</p> <ul style="list-style-type: none"> • Syslog—Unstructured Junos OS system logs. • Sd-syslog—Structured Junos OS system logs. • Binary—Non-ASCII (binary) Junos OS system logs.
Disable Logging	Select this check box to disable security logging for the device. This check box is cleared by default.
UTC Timestamp	Select this check box to include the UTC timestamp in the security logs. This check box is cleared by default.
Event Rate	<p>For the event mode, specify the rate (in logs per second) at which event logs are processed by the control plane.</p> <p>Range: 1 through 1500.</p>
<i>Stream</i>	

Table 103: Security Logging Settings (*continued*)

Setting	Guideline
	<p>The existing stream configuration entries are displayed in a table. You can do the following:</p> <ul style="list-style-type: none"> • Create a stream configuration–Click the + icon to create a stream configuration. The Create Stream Configuration page appears. Complete the configuration according to the guidelines provided in Table 104 on page 240 and click OK. The stream configuration is created and you are returned to the Security Logging page. • Modify a stream configuration–Select a stream configuration and click the pencil icon The Edit Stream configuration page appears, showing the same fields that are presented when you create a stream configuration. You can modify some of the fields on this page. Refer to Table 104 on page 240 for an explanation of the fields. After you have modified the stream configuration, click OK. The changes are saved and you are returned to the Security Logging page. • Delete stream configurations–Select one or more stream configurations and click the X icon to delete the stream configurations. The Warning page appears. Click Yes to confirm the deletion. The selected stream configurations are deleted.
<i>File</i>	
File Name	Specify the filename for the binary log file.
File Path	Specify the file path for the binary log file.
File Size	Specify the maximum size (in MB) of the binary log file. Range: 1 through 10.
Maximum No. of Files	Specify the maximum number of binary log files. Range: 2 through 10.
<i>Cache</i>	
Limit	Specify the maximum number of security log entries to keep in memory. The range is 1 through 4,294,967,295 and the default is 1000.

Table 103: Security Logging Settings (*continued*)

Setting	Guideline
Exclude	<p>The existing exclude configuration entries are displayed in a table. An exclude configuration is a list of auditable events that can be excluded from the audit log. You can do the following:</p> <ul style="list-style-type: none"> • Create an exclude configuration–Click the + icon to create an exclude configuration. The Create Exclude Configuration page appears. Complete the configuration according to the guidelines provided in Table 105 on page 241 and click OK. The exclude configuration is created and you are returned to the Security Logging page. • Modify an exclude configuration–Select an exclude configuration and click the pencil icon. The Edit Exclude Configuration page appears, showing the same fields that are presented when you create an exclude configuration. You can modify some of the fields on this page. Refer to Table 105 on page 241 for an explanation of the fields. After you have modified the exclude configuration, click OK. The changes are saved and you are returned to the Security Logging page. • Delete exclude configurations–Select one or more exclude configurations and click the X icon to delete the exclude configurations. The Warning page appears. Click Yes to confirm the deletion. The selected exclude configurations are deleted.

Table 104: Create Stream Configuration Settings

Setting	Guideline
Name	Enter the name of the security log stream, which should be a string containing alphanumeric characters and some special characters (_).
Host	Specify the IPv4 or IPv6 address of the server to which the security logs will be streamed.
Port	<p>Enter the port number for the system log listening port.</p> <p>The range is 0 through 65,535 and the default is 514.</p>
Severity	<p>Select the severity threshold for security logs.</p> <p>Only the logs with the specified severity threshold are logged.</p>
Category	Select the category of events to be logged.

Table 104: Create Stream Configuration Settings (*continued*)

Setting	Guideline
Format	<p>Specify the format of the security log for the device:</p> <ul style="list-style-type: none"> • Syslog–Unstructured Junos OS system logs. • Sd-syslog–Structured Junos OS system logs. • welf–Web Trends Extended Log Format.

Table 105: Create Exclude Configuration Settings

Setting	Guideline
Name	Specify the name of the exclude configuration.
<i>Destination Filters</i>	
IP Address	Specify the destination IPv4 or IPv6 address from which security alarms are not included in the audit log.
Port	<p>Specify the destination port number from which security alarms are not included in the audit log.</p> <p>The range is 0 through 4,294,967,295.</p>
<i>Source Filters</i>	
IP Address	Specify the source IPv4 or IPv6 address from which security alarms are not included in the audit log.
Port	<p>Specify the source port number from which security alarms are not included in the audit log.</p> <p>The range is 0 through 4,294,967,295.</p>
<i>Other Filters</i>	
Event ID	<p>Enter the event ID of the security event.</p> <p>The audit log does not include security alarms for the specified event ID.</p>
Failure	Select this check box to restrict the logging only to failed events. By default, this check box is cleared, which means failed and successful events are logged.
Interface	Enter the name of the interface from which security alarms are not included in the security log.

Table 105: Create Exclude Configuration Settings (*continued*)

Setting	Guideline
Policy Name	Enter the name of the security policy for which security alarms are not included in the security log.
Process	Enter the name of the process (that is generating the events) for which security alarms are not included in the security log.
Protocol	Enter the name of the protocol for which security alarms are not included in the security log.
Success	Select this check box to restrict the logging only to successful events. By default, this check box is cleared, which means failed and successful events are logged.
Username	Enter the username of the authenticated user for which security alarms that are enabled by the user are not included in the security log.

[Security Devices Overview | 203](#)

Modifying the Screens Configuration for Security Devices

You can use the Screens section on the Modify Configuration page to modify the security screen configuration for a device. You can modify settings related to screen name, denial of service, anomalies, and reconnaissance.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/p for a particular release and device. There you can find detailed information on the configuration parameters for that

To modify the system log parameters:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices whose configuration you want to modify.

3. From the More or right-click menu, select **Configuration > Modify Configuration**.

The Modify Configuration page appears.

4. Click the **Screens**.

The Screens page appears.

5. For the SRX Series devices, modify the configuration according to the guidelines provided in [Table 106 on page 243](#).

Starting Junos Space Security Director Release 16.2, you can configure screens for MX Series routers. For the MX Series routers, modify the configuration according to the guidelines provided in [Table 107 on page 252](#).

6. After modifying the configuration, you can cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 106: Screens for SRX Series Devices

Setting	Guideline
Name	Modify the name of the screen.
Description	Modify the description of the screen.

Table 106: Screens for SRX Series Devices (*continued*)

Setting	Guideline
Generate alarms without dropping packets	Select this check box to generate an alarm when detecting an attack but not to block the attack.
<i>Denial of Service</i>	
Land attack protection	<p>Select this option to prevent land attacks, where an attacker sends spoofed IP packets with headers containing the target's IP address for the source and destination IP address.</p> <p>Combining the SYN flood defense with IP spoofing protection prevents land attacks</p>
Teardrop attack protection	Select this option to prevent a teardrop attack, which exploits the reassembly of fragmented IP packets. The device drops any packets that have such a discrepancy.
ICMP fragment protection	<p>Select this option to block any ICMP packet that has the More Fragments flag set or that has an offset value.</p> <p>Because ICMP packets contain very short messages, there is no legitimate reason for ICMP packets to be fragmented. If an ICMP packet is so large that it must be fragmented, something is amiss.</p>
Ping of death attack protection	<p>Select this option to prevent a ping-of-death attack, which occurs when sending IP packets exceeding the maximum allowed size (65,535 bytes).</p> <p>Although the TCP/IP specification requires a specific packet size, many ping implementations allow larger packet sizes. Larger packets can trigger a range of adverse system reactions, including crashing, freezing, and restarting.</p>
Large size ICMP packet protection	Select this option to drop ICMP packets with a length greater than 1024 bytes.
Block fragment traffic	Select this option to deny IP fragments on a security zone and to block all IP packet fragments that are received at interfaces bound to that zone.
SYN-ACK-ACK proxy protection	<p>Select this option to prevent a SYN-ACK-ACK attack, which occurs when the attacker establishes multiple telnet sessions without allowing each session to terminate.</p> <p>After the number of connections from the same IP address reaches the SYN-ACK-ACK proxy threshold, the device rejects further connection requests from that IP address.</p>

Table 106: Screens for SRX Series Devices (*continued*)

Setting	Guideline
WinNuke attack protection	<p>Select this option to detect attacks in Windows NetBIOS communications.</p> <p>Each WinNuke attack triggers an attack log entry in the event alarm log. WinNuke is a DoS attack targeting any computer on the Internet running Windows.</p>
<i>Anomalies</i>	
Bad option	Select this option to detect and drop any packet with an incorrectly formatted IP option in the IP packet header (IPv4 or IPv6). The device records the event in the screen counters list for the ingress interface.
Security	Select this option to detect packets where the optional header field is IP option 2 (security), and the event is recorded in the screen counters list for the ingress interface.
Unknown protocol	Select this option to discard all received IP frames with protocol numbers greater than 137 for IPv4 and 139 for IPv6. These protocol numbers are undefined or reserved.
Strict source route	<p>Select this option to detect packets where the optional header field is IP option 9 (strict source routing), and the event is recorded in the screen counters list for the ingress interface.</p> <p>This option specifies the complete route list for a packet to take on its journey from source to destination. The last address in the list replaces the address in the destination field.</p>
Source route	<p>Select this option either to block any packets set with loose or strict source route options or to detect such packets and then record the event in the counters list for the ingress interface.</p> <p>Source routing allows users at the source of an IP packet transmission to specify the IP addresses of the devices that they want an IP packet to take on its way to its destination.</p>
Timestamp	Select this option to detect packets where the optional header field is IP option 4 (Internet timestamp), and the event is recorded in the screen counters list for the ingress interface. This option records the time (in Universal Time) when each network device receives the packet during its trip from the point of origin to its destination.

Table 106: Screens for SRX Series Devices (*continued*)

Setting	Guideline
Stream	<p>Select this option to detect packets where the optional header field is IP option 8 (stream ID), and the event is recorded in the screen counters list for the ingress interface.</p> <p>This option provides a way for the 16-bit SATNET stream identifier to be carried through networks that do not support streams.</p>
Loose source route	<p>Select this option to detect packets where the optional header field is IP option 3 (loose source routing), and the event is recorded in the screen counters list for the ingress interface.</p> <p>This option specifies a partial route list for a packet to take on its journey from source to destination.</p>
Record route	<p>Select this option to detect packets where the optional header field is IP option 7 (record route), and the event is recorded in the screen counters list for the ingress interface.</p> <p>This option records the IP addresses of the network devices along the path that the IP packet travels</p>
SYN fragment protection	<p>Select this option to detect packets where the optional IP header field indicates that the packet has been fragmented and the SYN flag is set in the TCP header.</p> <p>A fragmented SYN packet is anomalous, and, as such, it is suspect. To be cautious, block such unknown elements from entering your protected network.</p>
SYN and FIN flags set protection	<p>Select this option to detect an illegal combination of flags that attackers can use to consume sessions on the target device.</p> <p>Both the SYN and FIN control flags are not normally set in the same TCP segment header. The SYN flag synchronizes sequence numbers to initiate a TCP connection. The FIN flag indicates the end of data transmission to finish a TCP connection. Their purposes are mutually exclusive. A TCP header with the SYN and FIN flags set is anomalous TCP behavior, causing various responses from the recipient, depending on the OS.</p>
Fin flag without ACK flag set protection	<p>Select this option to detect an illegal combination of flags and to reject packets that have this combination.</p> <p>Because a TCP header with the FIN flag set but not the ACK flag is anomalous TCP behavior, there is no uniform response to this. The OS might respond by sending a TCP segment with the RST flag set.</p>

Table 106: Screens for SRX Series Devices (*continued*)

Setting	Guideline
<i>ICMP</i>	
Icmpv6-malformed	Select this option to verify whether the ICMPv6 packet received matches the defined criteria and performs the specified action on matching packets.
<i>IP</i>	
Ipv6-extension-header-limit	Specify the maximum number of permitted extension headers in a packet.
Ipv6 malformed header	Select this option to enable checks and filters for IPv6 packet headers. After these functions are enabled, the system checks incoming IPv6 packet to match the defined criteria for a specified action.
Ipv6 extension header	Select this option to selectively screen one or more extension headers.
Routing header	Select this option to inspect the routing-header type field and report a custom attack if a match with the specified value is found.
Fragment Header	Select this option to verify that there is only one fragment header.
Malformed shim6-header	Enable the IPv6 shim header screen option.
No-next-header	Select this option to detect whether the packet is an unknown protocol packet.
Mobility header	Select this option to allow nodes to remain reachable as the nodes move around in the IPv6 network.
AH-header	Select this option to provide data integrity and data authentication for IPv6 packets.
ESP-header	Select this option to provide both encryption and authentication for IPv6 packets.
HIP-header	Select the IPv6 Host Identify Protocol header screen option.
hop-by-hop-header	Select this option to verify that this is the first extension header to follow the IPv6 basic header.
Jumbo-payload-option	Select this option to set the payload length field in the IPv6 header to zero in every packet.

Table 106: Screens for SRX Series Devices (*continued*)

Setting	Guideline
Router-alert-option	Enable this option to notify transit routers to more closely examine the contents of an IP packet.
Quick-start-option	Select this option to allow TCP to determine the allowed sending rate at the beginning of a transport session and after an idle period of time.
CALIPSO-option	Select the Common Architecture Label IPv6 Security Option for including explicit sensitivity labels for IPv6 packets in multi-level security networking environments.
RLP-option	Select the Routing Protocol for Low-Power and Lossy Networks screen option in low power networks to convey routing information in every packet that a router forwards.
SMF-DPD-option	Select the Simplified Multicast Forwarding IPv6 Duplicate Packet Detection screen option for mobile ad hoc and wireless mesh networking use.
Destination-header	Select the IPv6 destination header screen option specifically to deliver information to the destination node.
Home-address-option	Select the home address screen option to assign an IP address to a device within its home network.
ILNP-nonce-option	Select the Identifier-Locator Network Protocol nonce screen option to separate the two functions of network addresses---identifying network endpoints and assisting routing by separating topological information from node identity.
line-Identification-option	Enable the line identification screen option.
Tunnel-encapsulation-limit-option	Select the tunnel encapsulation limit option to specify the number of additional levels of encapsulation allowed to be prepended to a packet.
<i>Flood Defense</i>	

Table 106: Screens for SRX Series Devices (*continued*)

Setting	Guideline
Limit sessions from the same source	<p>Set the number of concurrent sessions that can be initiated from a source IP address.</p> <p>When you set a source-based session limit, it can:</p> <ul style="list-style-type: none"> • Stem an attack such as the Nimda virus (which is actually both a virus and a worm) that infects a server and then begins generating massive amounts of traffic from that server. Because all the virus-generated traffic originates from the same IP address, a source-based session limit ensures that the firewall can control such excessive amounts of traffic. • Mitigate attempts to fill up the firewall's session table if all the connection attempts originate from the same source IP address.
Limit sessions from the same destination	<p>Set the number of concurrent sessions that can be directed to a single destination IP address. This ensures that the device allows only an acceptable number of concurrent connection requests—no matter what the source—to reach any one host.</p>
ICMP flood protection	<p>Select this option to prevent an ICMP flood attack, where ICMP echo requests use all resources in responding, such that valid network traffic can no longer be processed.</p> <p>The threshold value defines the number of ICMP packets per second allowed to ping the same destination address before the device rejects further ICMP packets.</p>
UDP flood protection	<p>Select this option to prevent a UDP flood attack, where an attacker sends IP packets containing UDP datagrams to slow down resources, such that valid connections can no longer be handled.</p> <p>The threshold value defines the number of UDP packets per second allowed to ping the same destination IP address or port pair. When the number of packets exceeds this value within any 1-second period, the device generates an alarm and drops subsequent packets for the remainder of that second.</p>
SYN flood protection	<p>Select this option to prevent a SYN flood attack, where the connecting host continuously sends TCP SYN requests without replying to the corresponding ACK responses.</p> <p>When the number of SYN segments per second exceeds the set threshold, the device will either start proxying incoming SYN segments by replying with SYN/ACK segments and storing the incomplete connection requests in a connection queue, or it will drop the packets.</p>

Table 106: Screens for SRX Series Devices (*continued*)

Setting	Guideline
Attack Threshold	<p>Set the number of SYN packets per second (pps) required to trigger a SYN proxy response. The default value is 200 pps, and you can set the attack threshold from 1 to 500,000 pps.</p> <p>Although you can set the threshold to any number, you need to know the normal traffic patterns at your site to set an appropriate threshold for it. For example, if for an e-business site that normally gets 20,000 SYN segments per second, you might want to set the threshold to 30,000 pps. If a smaller site normally gets 20 SYN segments per second, you might consider setting the threshold to 40 pps.</p>
Alarm Threshold	<p>Set the number of proxied, half-completed TCP connection requests per second after which the device enters an alarm in the event log.</p> <p>The value you set for an alarm threshold triggers an alarm when the number of proxied, half-completed connection requests to the same destination address per second exceeds that value.</p>
Source Threshold	<p>Set the number of SYN segments that the device can receive per second from a single source IP address before the device begins dropping connection requests from that source. The default value is 4000 per second, and you can set the source threshold from 4 to 500,000 per second.</p> <p>Tracking a SYN flood by source address uses different detection parameters from tracking a SYN flood by destination address. When you set a SYN attack threshold and a source threshold, you put both the basic SYN flood protection mechanism and the source-based SYN flood tracking mechanism in effect.</p>
Destination Threshold	<p>Set the number of SYN segments received per second for a single destination IP address before the device begins dropping connection requests to that destination. The default value is 4000 per second, and you can set the destination threshold from 4 to 1,000,000 per second.</p> <p>If a protected host runs multiple services, you might want to set a threshold based on destination IP address only—regardless of the destination port number.</p>
Timeout	<p>Set the maximum length of time before a half-completed connection is dropped from the queue. The default value is 20 seconds, and you can set the timeout from 1 to 50 seconds. When either a source or destination threshold is not configured, the system will use the default threshold value.</p> <p>You can decrease the timeout value until you see any connections dropped during normal traffic conditions.</p>

Table 106: Screens for SRX Series Devices (*continued*)

Setting	Guideline
<i>Reconnaissance</i>	
IP spoofing	<p>Select this option to prevent an IP spoofing attack, where an invalid source address is inserted in the packet header to make the packet appear to come from a trusted source.</p> <p>The mechanism to detect IP spoofing relies on route table entries. When the device detects the packet with a spoofed source IP address, it discards the packet.</p>
IP sweep	<p>Select this option to prevent an IP sweep attack, where an attacker sends ICMP echo requests (pings) to multiple destination addresses. If a target host replies, the reply reveals the target's IP address to the attacker. If the device receives 10 ICMP echo requests within the number of microseconds specified in this statement, then it flags this as an IP sweep attack and rejects the eleventh and all further ICMP packets from that host for the remainder of the second.</p> <p>The threshold value defines the maximum number of microseconds during which up to 10 ICMP echo requests from the same host are allowed into the device.</p>
TCP sweep	<p>Select this option to prevent a TCP sweep attack, where an attacker sends TCP SYN packets to the target device as part of the TCP handshake. If the device responds to those packets, then the attacker gets an indication that a port in the target device is open, which makes the port vulnerable to attack. If a remote host sends TCP packets to 10 addresses in 0.005 seconds (5000 microseconds), then the device flags this as a TCP sweep attack.</p>
UDP sweep	<p>Select this option to prevent a UDP sweep attack, where an attacker sends UDP packets to the target device. If the device responds to those packets, then the attacker gets an indication that a port in the target device is open, which makes the port vulnerable to attack. If a remote host sends UDP packets to 10 addresses in 0.005 seconds (5000 microseconds), then the device flags this as an UDP sweep attack.</p>
Port scan	<p>Select this option to prevent a port scan attack, where the available services are scanned in the hopes that at least one port will respond, thus identifying a service to target.</p> <p>A port scan occurs when one source IP address sends IP packets containing TCP SYN segments to 10 different destination ports within a defined interval. The default interval is 5000 microseconds.</p>

Table 107: Screens for MX Series Routers

Setting	Guideline
Name	Modify the name of the screen.
Match Direction	<p>Specify the direction in which the rule match is applied.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> • Input—Apply the rule match on the input side of the interface. • Output—Apply the rule match on the output side of the interface. • Input-Output—Apply the rule match bidirectionally.
Service Set	Select a service set from the list that you have already created to define a collection of services to be performed by an Adaptive Services interface (AS) or Multiservices line cards (MS-DPC, MS-MIC, and MS-MPC).
<i>Rule Settings</i>	
TCP	<ul style="list-style-type: none"> • By Source—Enable this option to limit sessions based on numbers generated from the configured source (IP or subnet) or application. <ul style="list-style-type: none"> • Max Sessions Allowed—Enter the maximum number of open sessions per application or IP address. • Max Packets Allowed—Enter the maximum peak packets per second per application or IP address. • Rate Per Second—Enter the maximum number of sessions per second per application or IP address. • By Destination—Enable this option to limit sessions based on numbers generated from the configured destination (IP or subnet) or application. <ul style="list-style-type: none"> • Max Sessions Allowed—Enter the maximum number of open sessions per application or IP address. • Max Packets Allowed—Enter the maximum peak packets per second per application or IP address. • Rate Per Second—Enter the maximum number of sessions per second per application or IP address. • By Pair—Enable this option to apply limit to paired stateful firewall and NAT flows (forward and reverse). <ul style="list-style-type: none"> • Max Sessions Allowed—Enter the maximum number of open sessions per application or IP address. • Max Packets Allowed—Enter the maximum peak packets per second per application or IP address. • Rate Per Second—Enter the maximum number of sessions per second per application or IP address. • TCP SYN Defense—Enable this option to prevent a SYN flood attack, where the connecting host continuously send TCP SYN requests without replying to the corresponding ACK responses. • TCP SYN Fragment—Enable this option to detect packets where the option IP header field indicates that the packet has been fragmented and the SYN field is set in the TCP header. • TCP Winnuke—Enable this option to detect attacks in Windows NetBIOS communications. Each WinNuke attack triggers an attack log entry in the event alarm log.

Modifying the Zones Configuration for Security Devices

You can use the Zones section on the Modify Configuration page to modify the security zone configuration for a device. You can modify settings related to zone name, system services, protocols, application tracking, and associate screen to the zone.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/p for a particular release and device. There you can find detailed information on the configuration parameters for that

To modify the system log parameters:

1. Select **Devices > Security Devices**.
The Security Devices page appears.
2. Select the devices whose configuration you want to modify.
3. From the More or right-click menu, select **Configuration > Modify Configuration**.
The Modify Configuration page appears.
4. Click the **Screens**.
The Screens page appears.
5. Modify the configuration according to the guidelines provided in [Table 108 on page 255](#).
6. After modifying the configuration, you can cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 108: Zones Settings

Setting	Guideline
Name	Modify the zone name.
Description	Modify the description of the zone.
Application Tracking	Enable this option to maintain the application usage statistics on a device. By default, when each session closes, application track generates a message that provides the byte and packet counts and duration of the session, and then sends the message to the syslog host device.

Table 108: Zones Settings *(continued)*

Setting	Guideline
Interfaces	Select the interfaces from the Available column to include in the selected list for the zones.
<i>System Services</i>	

Table 108: Zones Settings (*continued*)

Setting	Guideline
Is Except	<p>Select this option to disable specific incoming system service traffic, but only when the all system services option is defined.</p> <p>The following system services are supported:</p> <ul style="list-style-type: none"> • all—Enable traffic from the defined system services available on the Routing Engine (RE). Use the Is Except option to disallow specific system services. • any-service—Enable all system services on the entire port range including the system services that are not defined. • dns—Enable incoming DNS services. • finger—Enable incoming finger traffic. • ftp—Enable incoming FTP traffic. • http—Enable incoming Web authentication traffic. • https—Enable incoming Web authentication traffic over Secure Sockets Layer (SSL). • ident-reset—Enable the access that has been blocked by an unacknowledged identification request. • ike—Enable Internet Key Exchange (IKE) traffic. • lsping—Enable label switched path ping service. • netconf—Enable incoming NETCONF service. • ntp—Enable incoming Network Time Protocol (NTP) traffic. • ping—Allow the device to respond to ICMP echo requests. • r2cp—Enable incoming Radio Router Control Protocol traffic. • reverse-ssh—Reverse SSH traffic. • reverse-telnet—Reverse Telnet traffic. • rlogin—Enable incoming rlogin (remote login) traffic. • rpm—Enable incoming real-time performance monitoring (RPM) traffic. • rsh—Enable incoming remote shell (rsh) traffic. • sip—Enable incoming Session Initiation Protocol traffic. • snmp—Enable incoming SNMP traffic (UDP port 161). • snmp-trap—Enable incoming SNMP traps (UDP port 162). • ssh—Enable incoming SSH traffic. • telnet—Enable incoming Telnet traffic. • tftp—Enable TFTP services. • traceroute—Enable incoming traceroute traffic (UDP port 33434). • xnm-clear-text—Enable incoming Junos XML protocol traffic for all specified interfaces. • xnm-ssl—Enable incoming Junos XML protocol-over-SSL traffic for all specified interfaces.

Table 108: Zones Settings (*continued*)

Setting	Guideline
<i>Protocols</i>	
Is Except	<p>Select this option to disable specific incoming protocol traffic, but only when the all protocol option is defined.</p> <p>The following protocols are supported:</p> <ul style="list-style-type: none"> • all—Enable traffic from all possible protocols available. Use the Is Except option to disallow specific protocols. • bfd—Enable incoming Bidirectional Forwarding Detection (BFD) protocol traffic. • bgp—Enable incoming BGP traffic. • dvmrp—Enable incoming Distance Vector Multicast Routing Protocol (DVMRP) traffic. • igmp—Enable incoming Internet Group Management Protocol (IGMP) traffic. • ldp—Enable incoming LDP traffic (UDP and TCP port 646). • msdp—Enable incoming Multicast Source Discovery Protocol (MSDP) traffic. • nhrp—Enable incoming Next Hop Resolution Protocol (NHRP) traffic. • ospf—Enable incoming OSPF traffic. • ospf3—Enable incoming OSPF version 3 traffic. • pgm—Enable incoming Pragmatic General Multicast (PGM) protocol traffic (IP protocol number 113). • pim—Enable incoming Protocol Independent Multicast (PIM) traffic. • rip—Enable incoming RIP traffic. • ripng—Enable incoming RIP next generation traffic. • router-discovery—Enable incoming router discovery traffic. • rsvp—Enable incoming RSVP traffic (IP protocol number 46). • sap—Enable incoming Session Announcement Protocol (SAP) traffic. SAP always listens on 224.2.127.254:9875. New addresses and ports can be added dynamically. This information must be propagated to the Packet Forwarding Engine (PFE). • vrrp—Enable incoming Virtual Router Redundancy Protocol (VRRP) traffic.
<i>Traffic Control Options</i>	
TCP Rst	Enable this option to send a TCP packet with the RST (reset) flag set to 1 in response to a TCP packet with any flag other than SYN set and that does not belong to an existing session.
Screen	Select a security screen for a security zone to detect and block various kinds of traffic that the device determines as potentially harmful.

Table 108: Zones Settings (continued)

Setting	Guideline
Interface Services and Protocols	Display the selected interfaces and system services and protocols for the interface.

Modifying the IPS Configuration for Security Devices

You can use the IPS section on the Modify Configuration page to modify the sensor configuration for a device. You must configure the SRX Series device to send attack packets to the Junos Space Network Management Platform. Select the device and configure the parameters such as host IP address for receiving packets, source IP address, maximum sessions, threshold logging interval, total memory, and port.

NOTE: Refer to the Junos OS documentation available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/product/ for detailed information on the configuration parameters for a device.

To modify packet log parameters:

1. Select **Devices > Security Devices**.
The Security Devices page appears.
2. Select a device to modify the configuration.
3. From the More or right-click menu, select **Configuration > Modify Configuration**.
The Modify Configuration page appears.
4. Select **IPS**.

The Sensor Configuration screen appears.

5. Modify the configuration according to the guidelines provided in [Table 109 on page 260](#).

Table 109: Sensor Configuration Details

Setting	Guidelines
Host IP for receiving packets	The Virtual IP address of the Junos Space Network Management Platform server for SRX Series devices to send packets.
Source address	The interface IP address of the SRX Series device through which packets are sent.
Max Sessions	The maximum number of packet capture sessions expressed as a percentage of the IDP session capacity for the device.
Threshold logging interval	The minimum time interval in minutes between log messages for maximum sessions or memory reached.
Total Memory	The maximum amount of memory allocated to capture packets for a device. This value is expressed as a percentage of the memory available on the device.
Port	<p>The port number of the server for SRX Series devices to send the packet capture object.</p> <p>The port is 2050, which is opened on Junos Space Network Management Platform server on installing Security Director to receive packets from SRX series devices.</p>

Configuring Aruba ClearPass for Security Devices

Use the Aruba Clear Pass page to configure the Aruba ClearPass as the authentication source for the integrated ClearPass authentication and enforcement feature. The SRX Series device and Aruba ClearPass collaborate to protect your network resources by enforcing security at the user identity level and controlling user access to the Internet.

The ClearPass Policy Manager (CPPM) can authenticate users across wired, wireless, and VPN infrastructures. The integrated ClearPass feature allows the CPPM and the SRX Series device to collaborate in multiple environments in which they are deployed together.

To configure Aruba ClearPass:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices whose configuration you want to modify.

3. From the More or right-click menu, select **Configuration > Modify Configuration**.

The Modify Configuration page appears.

4. Click **ArubaClearPass** in the left-navigation menu.

The Aruba Clear Pass section on the Modify Configuration page is displayed.

5. Specify the parameters for configuring Aruba ClearPass according to the guidelines provided in

6. After modifying the configuration, you can cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 110: Fields on the Aruba Clear Pass Page

Field	Description
Name	Select the name of the Aruba ClearPass from the list.
Authentication Entry Timeout	Set the timeout interval after which the idle entries in the ClearPass authentication table expire. The timeout interval begins from when the user authentication entry is added to the ClearPass authentication table. If a value of 0 is specified, the entries will never expire. Range is 10 through 1440 minutes.
Invalid Authentication Entry Timeout	Enter the expiry time in minutes to apply to invalid authentication entries in the SRX Series authentication table for Windows active directory or Aruba ClearPass authentication sources. Range is 0 through 1440 minutes. The invalid authentication entry timeout setting is different from the general authentication entry timeout setting. It allows you to protect invalid user authentication entries in an authentication table from expiring before the user can be validated.
No User Query	Enable this option to turn off the user query function without deleting the user query configuration.

Table 110: Fields on the Aruba Clear Pass Page (*continued*)

Field	Description
User Query	Enable this option to allow the SRX Series device to query the ClearPass webserver for authentication and identity information for an individual user, whose information was not posted to the SRX Series device by ClearPass.
Client ID	<p>Enter the client ID that the SRX Series device requires to obtain an access token for the Integrated ClearPass Authentication and Enforcement user query function. Range is 1 through 64.</p> <p>If it is configured, the user query function allows the SRX Series device to query the CPPM for authentication and identity information about individual users when it does not receive this information from the CPPM through the SRX Series Web API daemon (webapi).</p>
CA Certificate	Specify the certificate file that the SRX Series device uses to verify the Clearpass server's certificate for the SSL connection that is used for the user query function. As the ClearPass administrator, you must export the certificate of the server from the CPPM and import it to the SRX Series device. Later, you must configure the ca-certificate path and the certificate filename on the SRX Series device. For example, <code>/var/tmp/RADIUSServerCertificate.crt</code> .
Client Secret	Specify the client secret used with the client ID that the SRX Series device requires to obtain an access token for the Integrated ClearPass Authentication and Enforcement user query function. The client secret must be consistent with the client secret configured on the CPPM. Range is 1 through 128.
Delay Query Time	<p>Enter the amount of time for the SRX Series device to delay before sending queries to the Aruba ClearPass Policy Manager (CPPM) for authentication and identity information for individual users. Range: 0 through 60 seconds.</p> <p>After the delay timeout expires, the SRX Series device sends the query to the CPPM and creates a pending entry for the user in the Routing Engine authentication table. During this period, any arriving traffic matches the default policy whose action on the traffic you can configure.</p>

Table 110: Fields on the Aruba Clear Pass Page (*continued*)

Field	Description
Query API	<p>Enter the query-api to specify the path of the URL that the SRX Series device uses to query the ClearPass Policy Manager (CPPM) webserver for authentication and identity information for an individual user.</p> <p>Consider the following query-api example: api/v1/insight/endpoint/ip/\$IP\$.</p> <p>The SRX Series device generates the complete URL for the user query request by combining the query-api string with the connection method (HTTPS) and the CPPM webserver IP address ({server}).</p> <p>https://{server}/api/v1/insight/endpoint/ip/\$IP\$</p> <p>In this example, the SRX Series device replaces the variables with the following values resulting in a specific URL request for the individual user: https://203.0.113.76/api/v1/insight/endpoint/ip/192.0.2.98.</p>
Token API	<p>Enter the token API that is used in generating the URL for acquiring an access token. The token API is combined with the connection method and the IP address of the ClearPass webserver to produce the complete URL used for acquiring an access token.</p> <p>For example, if the token API is oauth, the connection method is HTTPS, and the IP address of the ClearPass webserver is 192.0.2.199, the complete URL for acquiring an access token would be https://192.0.2.199/api/oauth. This is a required parameter. There is no default value.</p>
<i>Web Server</i>	
Address	<p>Enter the IPv4 address of the ClearPass webserver to communicate with the SRX Series device.</p> <p>The SRX Series device requests user authentication and identity information for an individual user from the ClearPass webserver whose address is configured. If you configure the user query function, the SRX Series device can obtain this information for a specific user when it does not receive it from the ClearPass Policy Manager through Web API POST requests.</p>
Server Name	Enter the server name of the ClearPass webserver to communicate with the SRX Series device.
Port	Select the TCP port of the SRX Series device to use for incoming HTTP or HTTPS connection requests initiated by the ClearPass Policy Manager (CPPM).

Table 110: Fields on the Aruba Clear Pass Page (*continued*)

Field	Description
Connect Method	<p>Select the application protocol used for the SRX Series device connection to the ClearPass Policy Manager (CPPM) for user query requests. Default is HTTPS.</p> <p>You identify the connection protocol as part of the configuration that identifies the CPPM server. The user query function allows the SRX Series device to request from the CPPM user authentication and identity information for an individual user.</p> <ul style="list-style-type: none"> • HTTP—Protocol that the CPPM uses to connect to the SRX Series device. • HTTPS—Secure version of the protocol that the CPPM uses to connect to the SRX Series device.

Configuring APBR Tunables for Security Devices

Use the APBR-Tunables page to configure the advanced policy-based (APBR) routing options to streamline the traffic handling. Fine-tuning the APBR configuration such as limiting route changes and terminating sessions are required to avoid the excessive transitions due to route changes.

To configure the APBR Tunables:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select a device whose configuration you want to modify.

3. From the More or right-click menu, select **Configuration > Modify Configuration**.

The Modify Configuration page appears.

4. Click **APBR-Tunables** from the left-navigation menu.

The APBR-Tunables page appears.

- 5. Configure the parameters as per the guidelines provided in [Table 111 on page 265](#).
- 6. Click **Save** to save the changes, **Preview Changes** to preview the configuration changes, **Save and Deploy** to save the configuration and update changes to the device, or **Cancel** to discard the changes. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 111: Fields on the APBR Tunables Page

Field	Description
Max route change	Configure the threshold for limiting the number of times a route can change for a session. The default value is 1. Range is 0-5.
Drop on zone mismatch	Enable this option to terminate the session instead of allowing traffic to traverse through the same route bypassing APBR. By default, this option is disabled.
Enable Log	Enable logging to record events that occur on the device for APBR-related operations. By default, the logging is disabled.

Modifying the Express Path Configuration for Security Devices

Express path (formerly known as services offloading) is a mechanism for processing fast-path packets in the network processor instead of in the Services Processing Unit (SPU). Express path considerably reduces packet-processing latency by 500–600 percent.

You can use the Express Path section on the Modify Configuration page to view, create, edit, or delete Flexible PIC Concentrator (FPC) details on a device. You can toggle the status of one or more express paths. Express path is supported only on SRX5400, SRX5600, SRX5800, and rootLsys devices.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/product/) for a particular release and device. There you can find detailed information on the configuration parameters for that device.

To modify the express path configuration:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices whose configuration you want to modify. Click **More** or use the right-click menu and select **Configuration > Modify Configuration**.

The Modify Configuration page appears.

3. Click the **ExpressPath** link in the left-navigation menu.

The Express Path section on the Modify Configuration page is displayed. The actions that you can perform in this page are provided in [Table 112 on page 267](#).

4. After modifying the configuration, you can cancel, save, preview, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Table 112: Express Path Actions

Action	Guidelines
Add FPC details	<p>Click the + icon to add FPC details.</p> <p>The Add FPC Details page appears. Complete the configuration according to the guidelines provided in Table 113 on page 267 and click OK.</p> <p>The FPC details are created and you are returned to the Express Path section on the Modify Configuration page.</p>
Edit FPC details	<p>Select an express path and click the pencil icon.</p> <p>The Edit FPC Details page appears, showing the same fields that are presented when you create an express path. See Table 113 on page 267 for a description of the fields. After you have modified the express path, click OK.</p> <p>The changes are saved and you are returned to Express Path section on the Modify Configuration page.</p>
Delete express path	<p>Select one or more express paths and click the X icon to delete the routes.</p> <p>The Warning page appears. Click Yes to confirm the deletion. The selected express paths are deleted.</p>
Toggle the status of an express path	<p>Select one or more express paths. Click More or use the right-click menu and select Toggle.</p> <p>The activated express paths are deactivated and the deactivated express paths are activated.</p> <p>NOTE: The Toggle option is enabled only when the selected express paths are a mix of activated and deactivated records.</p>

Table 113: Fields on the Add FPC Details Page

FPC Slot Number	Enter a valid FPC slot number, which can be a value from 0 through 127.
np-cache	Select this option to enable session cache on an I/O Card (IOC).

Modifying the Device Information Source Configuration for Security Devices

Use the Device Information Source page to configure the authentication source. Supported authentication sources include Active Directory and third-party network access systems.

The SRX Series device obtains the device identity information for authenticated devices from the authentication source. After the SRX Series device obtains the device information, it creates a device identity authentication table to store device identity entries. The SRX Series device searches the device identity authentication table for a device match when traffic issuing from a user's device arrives at the SRX Series device. If it finds a match, the SRX Series device searches for a matching security policy. If it finds a matching security policy, the security policy's action is applied to the traffic.

NOTE: Refer to the Junos OS documentation (available at https://www.juniper.net/documentation/en_US/release-independent/junos/information-products/pathway-pages/junos/product/) for a particular release and device. There you can find detailed information on the configuration parameters for that device.

To modify the authentication source:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices whose configuration you want to modify.

3. Click **More** or use the right-click menu and select **Configuration > Modify Configuration**.

The Modify Configuration page appears.

4. Click the **Authentication Source** link in the left-navigation menu.

The Device Information Source page is displayed.

5. Select an authentication source.

6. After modifying the configuration, cancel the changes, save the changes, preview the changes, or save the changes and deploy the configuration on the device. See [“Modifying the Configuration of Security Devices” on page 208](#).

Viewing the Active Configuration of a Device in Security Director

You can view the active configuration of one or more devices on the Security Devices page.

To view the active configuration:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select one or more devices. From the More or right-click menu, select **Configuration > View Active Configuration**.

The View Active Configuration page appears, displaying the active configuration on the selected devices. The left pane displays the Junos OS configuration statement hierarchy and the right pane displays the CLI and XML views of the configuration; the CLI configuration is displayed by default.

3. Select the actions that you want to perform by using the guidelines provided in [Table 114 on page 269](#).
4. Click **Close** to close the page.

You are returned to the Security Devices page.

Table 114: View Active Configuration Page Actions

Action	Guideline
Navigate the configuration	Click the right arrow to expand the configuration and the down arrow to collapse the configuration.
Search the configuration	<p>Enter a search term in the text box in the left pane and mouse over the right side of the text box and click the magnifying glass icon.</p> <p>The configuration statements that match the search text are displayed in the left pane. Select one or more check boxes to view the CLI corresponding to the search results.</p>

Table 114: View Active Configuration Page Actions (*continued*)

Action	Guideline
Customize the configuration display settings	<p>Click the gears icon in the left pane to modify the configuration display settings on the View Active Configuration page.</p> <p>The Modify Custom Settings page appears. Configure the settings according to the guidelines provided in Table 115 on page 270.</p> <p>Click Save to save your changes.</p> <p>You are taken to the View Active Configuration page where the settings are applied.</p>
View the configuration as it appears in the CLI	Click the CLI tab to view the configuration as it appears on the device CLI. This is the default view.
View the configuration in XML format	Click the XML tab to view the configuration in XML format.
View selected parts of the configuration	<p>Select the check box for a configuration statement to view the details of the configuration stanza in the CLI or XML tabs.</p> <p>If you have configured the option to select multiple configuration statements, then you can view more than one configuration stanza by selecting multiple check boxes.</p>
Export the configuration	<p>Click Export All to export the configuration for all the devices displayed.</p> <p>The Job Details: Export Device Configuration page appears, displaying the status of the job.</p> <p>Click the Download link to download the configuration (in ZIP format) to your local client.</p> <p>Click OK to close the Job Details page. You are returned to the View Active Configuration page.</p>

Table 115: Modify Custom Settings

Setting	Guideline
Multi Select	<p>Select this check box if you want to view more than one configuration statement hierarchy at the same time.</p> <p>This check box is clear by default.</p>
Alphabetical Ordering	Select this check box to view the configuration statement in alphabetical order.

Deleting Devices in Security Director

You can delete security devices from the Security Devices page. Deleting a device removes all device configuration and device inventory information from the Junos Space database. If provisioning services are associated with a device that you want to delete, you must remove the provisioning services before deleting the device. Security Director deletes the corresponding VPNs when you delete a device from Security Director.

To delete devices:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices that you want to delete. From the More or right-click menu, select **Operations > Delete Devices**.

The Delete Devices page appears displaying the devices selected for deletion.

3. Click **OK** to confirm the deletion.

The Job Details: Delete Device page appears displaying information about the job. If the job is successful, Junos Space deletes all device configuration and inventory information for the selected devices from the database.

4. Click **OK** to close the Job Details page.

You are returned to the Security Devices page.

Rebooting Devices in Security Director

You can reboot security devices from the Security Devices page. You can also reboot virtual chassis setups, dual Routing Engine (RE) setups, and cluster setups. However, you cannot reboot logical system (LSYS) devices in Security Director.

NOTE: You can only reboot devices for which the connection status is *Up*.

To reboot devices:

1. Select **Devices > Security Devices**.
The Security Devices page appears.
2. Select the devices that you want to reboot. From the More or right-click menu, select **Operations > Reboot Devices**.
The Reboot Devices page appears displaying the devices selected for rebooting
3. Specify the parameters for rebooting devices according to the guidelines provided in [Table 116 on page 272](#).
4. Click **OK** to reboot the devices.
The Job Detail: Reboot Devices appears displaying the details of the job.
5. Click **OK** to close the Job Details page.
You are returned to the Security Devices page.

NOTE: You can view the job results from the Job Management page. If some of the devices fail to reboot, you can use the Retry on Failed Devices action to retry rebooting the devices that failed to reboot. See [“Retrying a Failed Job on Devices in Security Director” on page 173](#).

Table 116: Reboot Devices Settings

Setting	Guideline
Power off device after reboot	Select this check box if you want the devices to be powered off after the reboot.

Table 116: Reboot Devices Settings *(continued)*

Setting	Guideline
Message	Enter a message that will be broadcast to users who are logged in to the devices being rebooted.
Type	Specify whether the devices should be rebooted immediately or later. If you specify that the operation should be run later, you must specify a start date and time (in MM/DD/YYYY and HH:MM:SS 24-hour or AM/PM formats) for the reboot operation.

Resolving Key Conflicts in Security Director

Devices connect to Junos Space using an RSA key. When the device is disconnected or is down, a new RSA key can be generated from the Administration workspace of the Junos Space Network Management Platform. However, when the device comes back online, it will not be able to reconnect to Junos Space using this key. The Authentication Status column on the Security Devices page shows when the device is in the Key Conflict state. You can use the Resolve Key Conflict action in such instances to resolve the key conflict by providing the authentication credentials for the device.

To resolve key conflicts in one or more devices:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices. From the More or right-click menu, select **Operations > Resolve Key Conflict**.

The Resolve Key Conflict page appears displaying the list of devices you selected.

3. For each device listed, select the device, click the **Edit** button, and enter the parameters according to the guidelines provided in [Table 117 on page 274](#).

4. Click the **Upload** button.

The Job Details: Upload RSA Keys page appears displaying the status of the job. The information about the devices and the status of the upload for each device is displayed in a table.

5. Click **OK** to close the Job Details page.

You are returned to the Security Devices page.

Table 117: Resolve Key Conflict Settings

Setting	Guideline
IP Address	Displays the IPv4 or IPv6 address of the device.
Username	Enter the username of the user on the device.
Password	Enter the corresponding password for user on the device.

Launching a Web User Interface of a Device in Security Director

You can access the Web User Interface of a device to manage it directly from Security Director. The device should have the required Web UI components installed and enabled.

NOTE: Once launched, the Web UI appears in a new tab in your browser. Ensure that you enable pop-ups on your browser for the device for which the Web UI is being launched.

To launch the Web UI of a device:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the device for which you want to launch the Web UI. From the More or right-click menu, select **Access > Launch Device WebUI**.

The Juniper Web Device Manager page appears in a new tab or browser window.

3. Specify the login credentials according to the guidelines provided in [Table 118 on page 275](#).
4. Click **Log In** to log in to the device.

If the authentication credentials are correct, you are logged in to the device and can perform the desired operations on the device.

Table 118: Juniper Web Device Manager Settings

Setting	Guideline
Username	Username of the user on the device.
Password	Password of the user on the device.

Connecting to a Device by Using SSH in Security Director

You can establish an SSH connection to a device from the Security Devices page. You can also establish multiple SSH sessions to the same device. A new SSH terminal window is opened for every new connection to the device.

CAUTION: Some browser plug-ins might cause undesirable behavior in open SSH windows; disabling such plug-ins might resolve the issue.

Before you open an SSH session to connect to a managed device, ensure that:

- You have the privileges of a Super Administrator or Device Manager.
- The status of the managed device is UP.

NOTE: Once launched, the SSH window appears in a new window. Ensure that you enable pop-ups on your browser for the device for which the application is being launched.

To connect to a device by using SSH:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the device to which you want to connect. From the More or right-click menu, select **Access > SSH to Device**.

The SSH to Device page appears in a new tab or browser window.

3. Specify the login credentials according to the guidelines provided in [Table 119 on page 276](#).

4. Click **Connect** to log in to the device..

Junos Space validates the fingerprint stored in the database with that on the device. If the fingerprints on the device match the fingerprints in the database, the SSH terminal is displayed. If the fingerprints do not match, you need to acknowledge the device SSH fingerprints. See [“Resolving Key Conflicts in Security Director” on page 273](#).

5. Terminate the SSH session by typing **exit** at the command prompt, and then press Enter.

6. Click the X button in the browser window or tab to close the SSH window.

Table 119: SSH to Device Settings

Setting	Guideline
IP Address	Displays the IP address of the device.
Username	Enter the username of the user on the device.
Password	Enter the corresponding password for user on the device.

Importing Security Policies to Security Director

Security Director enables you to import firewall, NAT, and IPS policies from a device. All objects supported by Security Director are imported during the policy import process.

To import a device configuration to Security Director:

1. Select **Devices > Security Devices**.

2. Select a device and then click **More**.

3. Click **Import**.

The Import Configuration page appears.

You can also right-click the selected device and select **Import**.

4. Select the policy to be imported to Security Director.

5. Click **Next**.

6. Resolve any conflicts after you verify the information, if needed.

NOTE: Security Director creates a new policy each time you import one. If a policy with the same name but a different definition exists, then conflicts arise.

7. Click **Finish**.

Security Director displays a summary of the configuration changes.

8. Click the **Summary Report** link.

The summary report is downloaded as a ZIP file. This summary report .zip file contains the complete rules report as a PDF.

9. Click **OK** to complete the import process.

The Job Details page appears with the import success details.

NOTE: You can download the summary report from Job Details page. Click **Download Summary**. The summary report is downloaded in the ZIP format.

10. Click **OK**.

Importing Device Changes

You can import out-of-band changes, which are made on the device and managed by Security Director.

To import the device changes:

1. Select **Devices > Security Devices**
2. Select a device and then click **More**.
3. Select **Device Change > Import Device Change**.

The Import Device Change page appears.

You can also right-click the selected device and select **Device Change > Import Device Change**.

4. Select the policy to be imported.
5. Click **Next**.
6. Resolve any conflicts after you verify the information, if needed.
7. Click **Finish**.

Security Director displays a summary of the configuration changes.

Viewing Device Changes

You can check the status of the security configuration changes, either in CLI or XML format.

To view the device changes:

1. Select **Devices > Security Devices**.
2. Select a device and then click **More**.
3. Click **Device Change > View Device Change**.

The View Device Change page appears.

You can also right-click the selected device and select **Device Change > View Device Change**.

4. Enable the required service types to preview the selected policies on the device. For example, enable Firewall Policy to preview the firewall policies on the device.
5. Click **OK**.

The View Configuration for x page appears, where, x is the configuration change name. For example, View configuration for 1002009SecGW01.
6. Select CLI or XML tab to check the status of the security configuration changes in the preferred format.
7. Click **OK**.

The configuration changes are displayed in both the CLI and XML tabs. You can push the configurations to the device after validating the changes.

Viewing and Exporting Device Inventory Details in Security Director

You can manage the device inventory from the Security Devices page. The device inventory is synchronized with the Junos Space database after the device is discovered. The device is resynchronized with Junos Space every time there is a change on the device (if Junos Space is the System of Record) or if you trigger a manual resynchronization. When the device is synchronized, the device inventory in the Junos Space database matches the inventory on the device.

To view and export device inventory details:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select one or more devices. From the More or right-click menu, select **View Inventory Details**.

The inventory details for the devices that you selected are displayed on a new page with three tabs: Physical Inventory, Physical Interfaces, and Logical Interfaces. The Physical Inventory tab is selected by default. [Table 120 on page 281](#) displays the fields on the Physical Inventory tab.

3. Click the export icon on the Physical Inventory tab to export the physical inventory details.

The Job Details: Export Physical Inventory page appears, displaying details of the job. When the job completes, click the **Download** link to download the inventory details.

Click **OK** to close the Job Details page.

4. Click the **Physical Interfaces** tab to view the inventory details for the physical interfaces on the devices. [Table 121 on page 281](#) displays the fields on the Physical Interfaces tab.

5. Click the export icon on the Physical Interfaces tab to export the physical interface details.

The Job Details: Export Physical Interface page appears, displaying details of the job. When the job completes, click the **Download** link to download the interface details.

Click **OK** to close the Job Details page.

6. Click the **Logical Interfaces** tab to view the inventory details for the logical interfaces on the devices.
[Table 122 on page 282](#) displays the fields on the Logical Interfaces tab.

7. Click the export icon on the Logical Interfaces tab to export the logical interface details.

The Job Details: Export Logical Interface page appears, displaying details of the job. When the job completes, click the **Download** link to download the interface details.

Click **OK** to close the Job Details page.

Table 120: Physical Inventory Tab Fields

Field	Description
Module	Type of module on the device.
Device Name	Name of the device.
Model Number	Model number of the device component.
Model	Model of the device.
Part Number	Part number of the device.
Vendor Part Number	Part number of the optical module installed on the device.
Vendor Material Number	Material number of the optical module installed on the device.
Revision	Revision number of the device.
Serial Number	Serial number of the device component.
Status	Status of the component: Online or Offline. The status is updated during periodic resynchronization of configuration information and on notification.
Domain	Domain to which the device is assigned.
Description	Description of the component.

Table 121: Physical Interfaces Tab Fields

Field	Description
Device Name	Name of the device.

Table 121: Physical Interfaces Tab Fields (*continued*)

Field	Description
Physical Interface Name	Standard information about the interface, in the format <i>type-/fpc/pic/port</i> , where <i>type</i> is the media type that identifies the network device; for example, ge-0/0/6.
IP Address	IPv4 address of the interface.
IPv6 address	IPv6 address of the interface, if configured.
Logical Interfaces	Link to the table of logical interfaces for the device. Click View to view the logical interfaces for the corresponding physical interface.
MAC Address	MAC address of the device.
Operational Status	Operational status of the interface: up or down.
Admin Status	Admin status of the interface: up or down.
Link Level Type	Link level type of the physical interface.
Link Type	Physical interface link type: full duplex or half duplex.
Speed	Speed (in MBps) at which the data transfer occurs in the interface.
MTU	Maximum transmission unit size (in bytes) on the physical interface.
Description	An optional description for this interface configured on the device. It can be any text string of 512 or fewer characters. Any longer string is truncated to 512. If no description was configured, this field is blank.
Domain	Domain to which the device is assigned.

Table 122: Logical Interfaces Tab Fields

Field	Description
Device Name	Name of the device.
Interface Name	Standard information about the interface, in the format <i>type- /fpc/pic/port.logical interface</i> , where <i>type</i> is the media type that identifies the network device; for example, ge-0/0/6.135.
IP Address	IP address for the logical interface.

Table 122: Logical Interfaces Tab Fields (*continued*)

Field	Description
IPv6 Address	IPv6 address for the interface, if configured.
Encapsulation	Encapsulation type used on the logical interface.
VLAN	VLAN ID for the logical interface.
Description	An optional description for this interface configured on the device. It can be any text string of 512 or fewer characters. Any longer string is truncated to 512. If no description was configured, this field is blank.
Domain	Domain to which the device is assigned.

Previewing Device Configurations

You can preview the configuration changes that will be pushed to the security device. You can preview the changes in either CLI or XML format.

To preview the configuration changes:

1. Select **Devices > Security Devices**.
2. Select a device and then click **More**.
3. Click **Configuration** and then select **Preview Changes**.

You can also right-click the selected device and select **Configuration > Preview Changes**.

4. Enable the required service types to preview the selected policies on the device. For example, enable Firewall Policy to preview the firewall policies on the device.
5. Click **OK**.

The View Configuration for x page appears, where, x is the configuration change name. For example, View configuration for 1002009SecGW01.

6. Select either the CLI or XML tab to check the status of the security configuration changes in the preferred format.
7. Click **OK**.

The configuration changes are displayed in both the CLI and XML tabs. You can push the configurations to the device after validating the changes.

NOTE: If the configuration changes are more than 2 MB, you can download the CLI configuration in PDF format.

Refreshing Device Certificates

You can refresh the certificate of a device to authenticate VPN and SSL. When you add a device manually, you need to synchronize the certificate, which can be done on more than one device at a time.

To refresh the device certificate:

1. Select **Devices > Security Devices**.
2. Select **device** you want to refresh the certificate and then click **More**.
3. Click **Refresh Certificate**.

The Refresh Device Certificates page appears.

You can also right-click the selected device and select **Refresh Certificate**.

4. Select the device(s) for certificate synchronization and click **OK**.

The Job Details page appears and provides the status of the certificate synchronization.

5. Click **View**.

The list of available certificates on the device appears.

6. Click **OK**.

Refreshing the device certificate process is complete.

Assigning Security Devices to Domains

You can assign devices to domains from the Security Devices page. By default, devices belong to the domain in which you are present when you run the device discovery profile.

To assign devices to a domain:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select the devices that you want to assign to one or more domains. From the More or right-click menu, select **Assign Device to Domain**.

The Assign Device to Domains page appears, displaying the list of domains to which you can assign the devices.

3. Select one or more domains by clicking the check boxes corresponding to the domains.
4. Specify whether warnings should be ignored for logical systems by selecting the **Ignore Warnings** check box.

5. Click **Assign**.

The Assign Objects to Domain Status page appears, displaying the status of the domain assignment.

NOTE: Although the status of the domain assignment is displayed as success, when the Ignore Warnings check box is selected it is possible that the selected devices are not assigned to the domain. You can verify if the assign to domain action was successful or not by viewing the corresponding audit log entry in the Audit Log page in Junos Space Network Management Platform. If the assignment was unsuccessful, you can find out the reasons from the audit log entry, rectify the problem, and retry the assignment.

6. Click **OK**.

You are returned to the Security Devices page.

Acknowledging Device SSH Fingerprints in Security Director

You use the Acknowledge Device Fingerprint action to acknowledge the SSH fingerprints received from the device or to resolve any SSH fingerprint conflicts between the fingerprints stored in the Junos Space database and that on the device. This action is enabled only if the Authentication Status column on the Security Devices page displays one of the following statuses: Credentials Based – Unverified; Key Based – Unverified; Key Conflict – Unverified; or Fingerprint Conflict.

To acknowledge SSH fingerprints in one or more devices:

1. Select **Devices > Security Devices**.

The Security Devices page appears.

2. Select one or more devices. From the More or right-click menu, select **Acknowledge Device Fingerprint**.

The Acknowledge Device Fingerprint page appears, displaying the list of devices you selected.

[Table 123 on page 287](#) displays the fields on this page.

- For each device listed, select the device, click the **Edit** button, and enter the new fingerprint of the device in the New Fingerprint field.

The fingerprint must be a string of 16 octets in hexadecimal format with numbers and lowercase letters separated by colons.

- Click **OK**.

The Confirm Acknowledge page appears asking you to confirm the fingerprint modification.

- Click **Yes**.

The Job Details: Acknowledge Device Fingerprint page appears, displaying details of the job. If a fingerprint entered for a device is in the valid format, then that fingerprint is updated in the Junos Space database.

- Click **OK** to close the Job Details page.

You are returned to the Security Devices page.

Table 123: Acknowledge Device Fingerprint Settings

Field	Description
Hostname	Displays the hostname of the device.
IP Address	Displays the IPv4 or IPv6 address of the device.
Authentication Status	Displays the authentication status of the device.
Fingerprint	If the Authentication Status column displays Fingerprint Conflict, this field displays the current fingerprint value of the device as stored in the Junos Space database. This field does not display any value if the Authentication Status column displays Key Conflict – Unverified; Key Based – Unverified; or Credentials Based – Unverified.
New Fingerprint	Displays the new fingerprint value received from the device if the Authentication Status field displays Fingerprint Conflict. Displays the current fingerprint value of the device as stored in the Junos Space database if the Authentication Status field displays Key Conflict – Unverified; Key Based – Unverified; or Credentials Based – Unverified.

Security Devices Main Page Fields

Use this page to view the security devices managed by Junos Space. You can perform various actions such as uploading keys, modifying the device configuration, updating devices, viewing and importing device changes, viewing the inventory details, and so on. You can filter and sort the devices displayed, and view the details of each device. [Table 124 on page 288](#) describes the fields on this page.

Table 124: Security Devices Main Page Fields

Field	Description
Device Name	Name of the managed device.
IP Address	IP address of the device.
OS Version	Operating system firmware version running on the device (This field displays Unknown for an unmanaged device.)

Table 124: Security Devices Main Page Fields (*continued*)

Field	Description
Schema Version	Device Management Interface (DMI) schema version that Junos Space uses for the device. (This field displays Unknown for an unmanaged device.)
CPU	Average CPU usage of a device that displays the CPU usage of both a control plane and a forwarding plane. Starting in Junos Space Security Director Release 16.1, for an SRX Series chassis cluster, you can view the usage of an individual user's CPU. Hover over the CPU meter to view the usage as a percentage.
Storage	Average partition usage of a device. Starting in Junos Space Security Director Release 16.1R1, for an SRX Series chassis cluster, you can view the usage of an individual user's partition. Hover over the storage meter to view the usage as a percentage.
Authentication Status	<p>Authentication status of the device:</p> <ul style="list-style-type: none"> • Key Based—The authentication key was successfully uploaded. • Credential Based—A key upload was not attempted; log in to this device with your credentials. • Key Based - Unverified—The new fingerprint on the device is not updated in the Junos Space database. • Key Conflict - Unverified—Key upload was unsuccessful, the new fingerprint on the device is not updated in the Junos Space database. • Credentials Based - Unverified—The new fingerprint on the device is not updated in the Junos Space database. • Key Conflict—The device was not available; the key upload was unsuccessful. • Fingerprint Conflict—The fingerprint stored in the Junos Space database differs from the fingerprint on the device. • NA—The device is unmanaged.
Connection Status	<p>Connection status of the device in Junos Space. Different values are displayed in network as system of record (SOR) and Junos Space as SOR modes:</p> <ul style="list-style-type: none"> • Up—The device is connected to Junos Space. When the connection status is up, in network as SOR mode, the Configuration Status is Out Of Sync, Synchronizing, In Sync, or Sync Failed. In Junos Space as SOR mode, the status is In Sync, Device Changed, Space Changed, Both Changed, or Unknown (which usually means connecting). • Down—The device is not connected to Junos Space. When the Connection status is down, the Configuration Status is None or Connecting. • NA—The device is unmanaged.

Table 124: Security Devices Main Page Fields (*continued*)

Field	Description
Managed Status	<ul style="list-style-type: none"> • In Sync • SD Changed • Device Changed • SD Changed, Device Changed
Platform	Model number of the device (For an unmanaged device, the platform details are discovered through SNMP. If the platform details cannot be discovered, the field displays Unknown.)
Pending Services	List of the policy names that are assigned and published. Versioning information is included for firewall and NAT policies.

Table 124: Security Devices Main Page Fields (*continued*)

Field	Description
Configuration Status	<p>Current state of the device configuration:</p> <ul style="list-style-type: none"> • Connecting—Junos Space has sent a connection remote procedure call (RPC) and is waiting for the first connection from the device. • Undefined—The device is in this state only for a short period when Junos Space is set as the SOR. • Unknown—This state occurs in the following cases: <ul style="list-style-type: none"> • When the device disconnects from Junos Space. The device status remains Unknown until the device reconnects to Junos Space and the configuration status of the device is checked against the Junos Space database. It will be in this state until the device connects • If Junos Space is trying to push or synchronize changes to the device based on the workflow for accepting or rejecting out-of-band changes on the device and the push or synchronize fails. • In Sync—The synchronization operation has completed successfully; Junos Space and the device are synchronized. • None—The device is discovered, but Junos Space has not yet sent a connection RPC. • Out Of Sync—In network as SOR mode, the device has connected to Junos Space, but the synchronization operation has not been initiated, or an out-of-band configuration change on the device was detected and auto-resynchronization is disabled or has not yet started. • Sync Failed—The synchronization operation failed. • Synchronizing—The synchronization operation has started as a result of device discovery, a manual resynchronization operation, or an automatic resynchronization operation. • Space Changed—In Junos Space as SOR mode, there are changes made to the device configuration from Junos Space. • Device Changed—In Junos Space as SOR mode, there are changes made to the device configuration from the device CLI. • Space & Device Changed—In Junos Space as SOR mode, there are changes made to the device configuration from the device CLI and Junos Space. Neither automatic nor manual resynchronization is available. • In-RMA—The configuration of the defective device is maintained in Junos Space so that the device can be reconnected and managed when it is replaced. • Reactivating—The defective device has been replaced and the reactivation of the replacement device to bring it back under management has started. • Reactivate Failed—The operation to reactivate the device has failed. • Unmanaged—The device is unmanaged. • Waiting for deployment—The modeled device is unreachable and needs to be activated. • Modeled—The device is modeled.

Table 124: Security Devices Main Page Fields (*continued*)

Field	Description
RAM	Average RAM usage of a device that displays the RAM usage of both a control plane and a forwarding plane. Starting in Junos Space Security Director Release 16.1R1, for an SRX Series chassis cluster, you can view the usage of an individual user's RAM. Hover over the RAM meter to view the usage as a percentage.
Device Family	Device family of the selected device. (For an unmanaged device, this is the same as the vendor name provided. The field displays Unknown if no vendor name was provided and if SNMP is not used or has failed.)
Serial Number	Serial number of the device chassis (This field displays Unknown for an unmanaged device.)
Assigned Services	List of all assigned services: firewall, NAT, IPS, and VPN. When a device is assigned to any firewall policy including NAT, IPS and VPN, the policy name is displayed.
Installed Services	List of the policy names that are published and updated to the device (this includes policy names for firewall, NAT, IPS, and VPN). Versioning information is included for firewall and NAT policies.
Fab Link Status	<ul style="list-style-type: none"> • Up • Down
Control Link Status	<ul style="list-style-type: none"> • Up • Down
Domain	Domain to which the device belongs.
Last Rebooted Time	Date and time when the device was last rebooted manually (that is, the device status changes from Down to Up) or from Junos Space.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, for an SRX Series chassis cluster, you can view the usage of an individual user's CPU.
16.1	Starting in Junos Space Security Director Release 16.1R1, for an SRX Series chassis cluster, you can view the usage of an individual user's partition.
16.1	Starting in Junos Space Security Director Release 16.1R1, for an SRX Series chassis cluster, you can view the usage of an individual user's RAM.

Overview of Device Discovery in Security Director

You use the device discovery feature to add devices to Junos Space. Device discovery is the process of finding a device and then synchronizing the device inventory and configuration with the Junos Space database. To use device discovery, Junos Space must be connected to the device.

You discover devices in Junos Space Security Director by creating and using a device discovery profile. A device discovery profile contains information about discovery targets, probes used to discover devices, credentials for authentication, and device SSH fingerprints, and is used to discover, authenticate, and connect to the device.

During discovery, Junos Space connects to the physical device and retrieves the running configuration and the status information of the device. To connect with and configure devices, Junos Space uses the Juniper Networks Device Management Interface (DMI), which is an extension of the NETCONF network configuration protocol.

To discover network devices, Junos Space uses SSH, and (optionally) ping, and SNMP protocols.

NOTE: Starting in Junos Space Security Director Release 16.2, Security Director discovers both SRX Series devices and MX Series routers.

Release History Table

Release	Description
16.2	Starting in Junos Space Security Director Release 16.2, Security Director discovers both SRX Series devices and MX Series routers.

Creating Device Discovery Profiles in Security Director

Use this page to configure a device discovery profile that you can use to discover devices.

Device discovery is the process of finding a device and then synchronizing the device inventory and configuration with the Junos Space database. To use device discovery, Junos Space must be able to connect to the device.

Before You Begin

- Read the “[Overview of Device Discovery in Security Director](#)” on page 294 topic.
- Review the Discovery Profiles main page to view the existing discovery profiles. See “[Device Discovery Main Page Fields](#)” on page 303 for field descriptions.

Configuring Device Discovery Profiles

To configure a device discovery profile:

1. Select **Devices > Device Discovery**.
The Device Discovery page appears.
2. Click the + icon.
The Create Discovery Profile page appears.
3. Complete the configuration according to the guidelines provided in [Table 125 on page 296](#).

NOTE: Fields marked with * are mandatory

4. Click **OK**.

A new device discovery profile is created and you are returned to the Device Discovery page. A Job Details page pops up after a few seconds and displays the details of the job scheduled.

5. Click **OK** to close the Job Details page.

Table 125: Discovery Profile Settings

Setting	Description
<i>Add Device Discovery Target</i>	
Discovery Profile Name	Enter a unique string containing only alphanumeric characters, spaces, and some special characters (- _ .). The name cannot start with a space and the maximum length is 32 characters.
Discovery Parameters	Specify whether the discovery parameters are entered manually or by using a comma-separated values (CSV) file.
Target Type	Select one of the options to specify the device targets, based on whether you want to discover a single device or multiple devices.
Target Details	<p>Select either IP address or hostname for the target type.</p> <p>If the target type is IP address, then enter the IPv4 or IPv6 address of the device that you want to discover based on the IP mode enabled in Junos Space Network Management Platform.</p> <p>If the target type is hostname, then enter the hostname of the device that you want to discover.</p> <p>Click Next to continue.</p>
Start IP Address	Enter the starting IPv4 or IPv6 address of the range of IP addresses for the devices that you want to discover.

Table 125: Discovery Profile Settings (*continued*)

Setting	Description
End IP Address	<p>Enter the ending IPv4 or IPv6 address of the range of IP addresses for the devices that you want to discover.</p> <p>NOTE: The maximum number of IP addresses for any target type is 1024.</p> <p>Click Next to continue.</p>
IP Subnet	Enter the IPv4 or IPv6 address or the IP address and prefix of the subnet to which the devices that you want to discover belong.
Subnet	<p>Enter the subnet mask of the subnet to which the devices that you want to discover belong. If you enter a prefix in the preceding field, this field displays the subnet mask calculated based on the prefix.</p> <p>Click Next to continue.</p>
<i>Specify Probes</i>	
Use Ping	Select this check box to use ping during the device discovery process. If you select this check box, you must configure devices to respond to ping requests.
Use SNMP	<p>Select this check box to use SNMP during the device discovery process. If you select this check box, you must configure SNMP on the devices being discovered.</p> <p>Click Back to return to the previous section or Next to continue.</p>
SNMP Version	Select the SNMP version (V1/V2C, or V3).
Community	<p>For SNMP V1 or V2C, specify the SNMP community string.</p> <p>Click Back to return to the previous section or Next to continue.</p>
Username	For SNMP V3, specify the username used for authentication.
Authentication Type	For SNMP V3, specify the type of authentication used (MD5, SHA1, or None).
Authenticated Password	For MD5 or SHA1 as the authentication type, specify the authentication password to be used.
Privacy Type	For SNMP V3, specify the type of privacy to be used (AES128, DES, or None).
Privacy Password	<p>For AES128 or DES as the privacy type, specify the privacy password to be used.</p> <p>Click Back to return to the previous section or Next to continue.</p>

Table 125: Discovery Profile Settings (*continued*)

Setting	Description
<i>Specify Credentials</i>	
Authentication Type	Specify whether you want to use credential-based or key-based authentication.
Username	Specify the username for credential-based or key-based authentication. Click Back to return to the previous section or Next to continue.
Password	For credential-based authentication, specify the password for logging in to the device.
Confirm Password	For credential-based authentication, reenter the password for confirmation. Click Back to return to the previous section or Next to continue.
<i>Specify Device Fingerprint</i>	
Specify Device Fingerprint	Specify the device fingerprint for each device target. The fingerprint must be a string of 16 octets in hexadecimal format with numbers and lowercase letters separated by colons. This is an optional step. Click Back to return to the previous section or Next to continue.
<i>Schedule Discovery Job</i>	
Type	Specify whether you want to run the device discovery job immediately or schedule it for a later date and time.
Recurrence	Select this check box if you want the device discovery job to recur and specify the details of the recurrence.
Import policies automatically after device(s) being discovered successfully	Select this check box if you want to import policies of devices into the Junos Space database after the devices are discovered and managed by Junos Space. Click Back to return to the previous section or Finish to go to a summary page.

Editing, Cloning, and Deleting Device Discovery Profiles in Security Director

You can edit, clone, and delete discovery profiles from the Device Discovery page. You clone a device discovery profile to easily create a new discovery profile. You delete discovery profiles that are not used.

Editing Device Discovery Profiles

To edit a device discovery profile:

1. Select **Devices > Device Discovery**.

The Device Discovery page appears.

2. Select the discovery profile that you want to edit, and click the pencil icon.

The Edit Discovery Profile page appears, showing the same fields that are presented when you create a discovery profile.

3. Edit the discovery profile fields as needed.

NOTE: Some fields cannot be edited.

4. Click **OK** to save the changes.

The changes are saved and you are returned to the Device Discovery page. A Job Details page pops up after a few seconds and displays the details of the job scheduled.

5. Click **OK** to close the Job Details page.

Cloning Device Discovery Profile

To clone a device discovery profile:

1. Select **Devices > Device Discovery**.

The Device Discovery page appears.

2. Select the discovery profile that you want to clone, and click the **Clone** button or select **Clone** from the More or right-click menu.

The Clone Discovery Profile page appears, showing the same fields that are presented when you create a discovery profile.

3. Modify the discovery profile fields as needed.

4. Click **OK** to save the changes.

The cloned discovery profile is created and you are returned to the Device Discovery page. A message indicating that the device discovery profile was cloned is displayed at the top of the page. A Job Details page pops up after a few seconds and displays the details of the job scheduled.

5. Click **OK** to close the Job Details page.

You are returned to the Device Discovery page

Deleting Device Discovery Profiles

To delete one or more device discovery profiles:

1. Select **Devices > Device Discovery**.

The Device Discovery page appears.

2. Select the device discovery profiles that you want to delete, and click the X icon.

A warning dialog box appears asking you to confirm the deletion.

3. Click **Yes** to delete the selected device discovery profiles.

The device discovery profiles are deleted and you are returned to the Device Discovery page.

[Running a Device Discovery Profile in Security Director | 300](#)

Running a Device Discovery Profile in Security Director

In the Device Discovery page, you can run a device discovery profile immediately in order to discover devices.

If you previously created a device discovery profile that was scheduled to run later and you now want to run the discovery profile immediately, this feature enables you to do so without modifying the profile.

To run a device discovery profile immediately:

1. Select **Devices > Device Discovery**.

The Device Discovery page appears.

2. Select the device discovery profile and click the **Run Now** button.

A device discovery job is triggered. After a few seconds, the Job Details page appears displaying information on the job.

3. Click **OK** to close the Job Details page.

You are returned to the Device Discovery page.

Viewing the Device Discovery Profile Details in Security Director

You can view the details of device discovery profiles, which allows you to view information about a device discovery profile at a quick glance on one page, from the Device Discovery page.

To configure a device discovery profile:

1. Select **Devices > Device Discovery**.

The Device Discovery page appears.

2. Double-click the discovery profile for which you want to view the details. Alternatively, select the discovery profile and from the More or right-click menu, select **View**.

The View Discovery Profile page appears. [Table 126 on page 302](#) describes the fields on this page.

3. Click **OK**.

You are returned to the Device Discovery page

Table 126: View Discovery Profile Page Fields

Field	Description
<i>Device Target</i>	
Discovery Profile Name	Name of the device discovery profile
Target Type	Indicates the type of target used to discover devices (IP address, IP address range, IP subnet, hostname, or imported from a comma-separated values (CSV) file).
Target Details	Indicates the value of the specified target type. For example, if the target type is IP range, then the IP address range is displayed.
<i>Probes</i>	
Use Ping	Indicates whether ping is enabled for device discovery or not.
Use SNMP	Indicates whether SNMP is enabled for device discovery or not.
SNMP Version	If SNMP is enabled, indicates the version of SNMP used for device discovery.
Community	Displays the community string used for SNMPv1 and SNMPv2c.
Username	For SNMPv3, indicates the username of the user that is used for authentication on the device.
Privacy Type	Indicates the type of privacy used for SNMPv3.
Key-Based	Indicates whether key-based authentication is used or not.
<i>Credentials</i>	
Authentication Type	Indicates whether the authentication is credential-based or key-based.
Username	Displays the username for credential-based or key-based authentication.
<i>Fingerprints</i>	
Hostname/IP	Displays the hostname or IP address of the device.
Fingerprint	Displays the fingerprint for the device.

Device Discovery Main Page Fields

Use this page to view, create, edit, clone, and delete device discovery profiles. You can filter and sort the device discovery profiles displayed, and view details of each device discovery profile. [Table 127 on page 303](#) describes the fields on this page.

Table 127: Device Discovery Main Page Fields

Field	Description
Device Discovery Profile	Name of the device discovery profile
Target Type	Indicates the type of target used to discover devices (IP address, IP address range, IP subnet, hostname, or imported from a comma-separated values (CSV) file).
Target Details	Indicates the value of the specified target type. For example, if the target type is IP range, then the IP address range is displayed.
Probes	Indicates the version of the SNMP probes used.
Username	Indicates the username of the user that is used for authentication on the device.
Key-Based	Indicates whether key-based authentication is used or not.
Schedule	Indicates the date and time at which the device discovery profile is scheduled to run.
Recurrence	If the recurrence is configured for the device discovery profile, this field displays the recurrence details.

Secure Fabric

IN THIS CHAPTER

- Creating Secure Fabric and Sites | 304
- Secure Fabric Overview | 305
- Adding Enforcement Points | 307
- Editing or Deleting a Secure Fabric | 309

Creating Secure Fabric and Sites

To access this page, click **Devices>Secure Fabric**.

You create sites within your secure fabric from the secure fabric page.

- Plan out your sites in advance. A site is a grouping of network devices, including firewalls and switches, that contribute to threat prevention.
- Keep in mind that when you create a site, you must identify the perimeter firewalls so you can enroll them with Sky ATP.
- If you want to enforce an infected host policy within the network, you must assign a switch to the site.
- Devices *cannot* belong to multiple sites.
- Switches and connectors *cannot* be added to the same site

To create a site within your secure fabric:

1. Select **Devices>Secure Fabric**.
2. Click the + icon.
3. Complete the configuration by using the guidelines in [Table 128 on page 305](#) below.
4. Click **OK**.
5. Create a new site and add an enforcement point to a site.

Table 128: Fields on the Create Site Page

Field	Description
Site	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.

WARNING: If you add certain SRX Series Devices to your Secure Fabric as enforcement points, you may see a warning that the device(s) must be reconfigured in enhanced mode and require a reboot. Here is a list of SRX models that may require rebooting for enhanced mode after being registered with Policy Enforcer/Sky ATP.

- SRX340
- SRX345
- SRX650
- SRX240h2
- SRX320
- SRX300
- SRX550

RELATED DOCUMENTATION

Secure Fabric Overview 305
Policy Enforcement Groups Overview 771
Threat Prevention Policy Overview 677

Secure Fabric Overview

Secure Fabric is a collection of sites which contain network devices (switches, routers, firewalls, and other security devices), used in policy enforcement groups. When threat prevention policies are applied to policy enforcement groups, the system automatically discovers to which sites those groups belong. This is how threat prevention is aggregated across your secure fabric.

- **Add Enforcement Points**—Click the **Add Enforcement Points** link to add Firewalls, Switches, and/or Connectors. There is a one-to-one mapping between devices with sites. If a device is mapped to a site, you cannot use the same device to map to a different site. The connector can be mapped to multiple sites. To filter by type, click the three vertical dots beside the search field and select the check box for the device type. See [“Creating Secure Fabric and Sites” on page 304](#) for more information.
- **Drag and Drop Enforcement Points**—From the main page, you can select enforcement points and drag them to other sites to include them there. When you drag, the enforcement point is disenrolled from the current site and gets enrolled to the new site where the enforcement point is dropped.

You can either have switches or a connector as enforcement points and not both. However, you can drag a switch and add to a site that already has a switch or SRX Series device.

[Table 129 on page 306](#) shows fields on the Secure Fabric page.

Table 129: Fields on the Secure Fabric Page

Field	Description
Site	Specifies the name of the secure fabric site.
Enforcement Points	<p>Specifies the enforcement points for that particular site, if enforcement points are already added. If not added, click Add Enforcement Points to add Firewalls, Switches, or Connectors as enforcement points.</p> <p>A firewall icon is shown against some of the devices to indicate that they are the perimeter firewalls.</p> <p>For connectors, if you hover over the enforcement point, a tool tip is shown listing the corresponding vSRX devices with IP addresses and descriptions.</p>
Model	Specifies the type of the enforcement point. For example, vSRX, QFX, Connector.
IP	Specifies the IP address of the enforcement point, if the enforcement point is available.
SKYATP Enroll Status	<p>Specifies the status of the SkyATP enrollment.</p> <p>The Success status with a warning symbol indicates that the device is enabled for cloud feeds only and there is no support for malware capability and enhanced mode. This field will be blank if the device fails to disenroll SkyATP.</p> <p>If the status is Failed, click Retry to enroll the device with Sky ATP again. You can hover over the Failed status to see the corresponding job details. The device enroll retry option is available only when the status is Failed.</p>
Last Updated	Specifies the date on which the Secure Fabric page was last updated.
Description	Specifies the description that you had entered at the time of creating a secure fabric site.

[Policy Enforcement Groups Overview | 771](#)

[Threat Prevention Policy Overview | 677](#)

Adding Enforcement Points

Use the Add Enforcement Points page to assign devices to a site and indicate which devices are perimeter firewalls. To enroll a device with Sky ATP, you must assign one or more perimeter firewalls to each site.

NOTE:

- When a connector instance is assigned to a site, that particular connector instance will not be listed as available enforcement point for other sites.
- If you want to enforce an infected host policy within the network, you must assign a switch to the site.
- Assigning a device to the site will cause a change in the device configuration.

To add firewalls, switches, or connectors as an enforcement point:

1. Select **Devices>Secure Fabric**.

The Secure Fabric page appears.

2. Select the required site for which you want to add enforcement points, and click **Add Enforcement Points**.

The Add Enforcement Points page appears.

3. Complete the configuration as shown in [Table 130 on page 308](#).

4. Click **OK**.

Table 130: Fields on the Add Enforcement Points Page

Field	Description
Enforcement points	<p>All device types are displayed in the list. To filter by type, click the three vertical dots beside the search field and select the check box for the device type.</p> <p>To include a device, select the check box beside the device in the Unassigned Devices list and click the > icon to move them to the Selected list. The devices in the Selected list will be included in the site.</p> <p>There is a one-to-one mapping between devices and connectors with sites. If a device or a connector is mapped to a site, you cannot use the same device or a connector to map to a different site.</p> <p>NOTE: Firewall devices are automatically enrolled with Sky ATP as part of this step. No manual enrollment is required. The only exception is “no selection” mode where Sky ATP is not available and therefore no enrollment takes place. (see “Sky ATP Configuration Type Overview” on page 850)</p> <p>The name of the connector type is shown as a tool tip when you hover over the name.</p>
Perimeter Firewall	<p>Select the edge firewall devices connecting the network to the internet. These devices will receive the threat feeds. Only firewall devices (SRX and vSRX) that you choose in the Enforcement Points field appear in the Perimeter Firewall field.</p> <p>Among the listed firewall devices, you can choose which firewall device to consider as a perimeter firewall. Only the perimeter devices are enrolled to Sky ATP. If you do not choose any firewall device as a perimeter firewall, all firewall devices listed in this field are enrolled to Sky ATP as perimeter firewalls by default.</p> <p>You can delete devices manually from the field. However, all the firewall devices are still available in the list to include later. To remove firewall devices permanently from list, you must move the firewall devices from the Selected column to the Available column in the Enforcement points field.</p> <p>In any Sky ATP configuration types, if there is a firewall device assigned to a site, it is mandatory to assign one of those devices as a perimeter firewall. If there are no firewall devices assigned to a site, the perimeter firewall list will be empty.</p> <p>When you enroll a connector instance to Policy Enforcer, the connector instance provides few vSRX Series devices. These vSRX devices are discovered by Policy Enforcer in Junos Space. Hover over the connector instances appearing in the Secure Fabric page to view the details of the corresponding vSRX devices. The vSRX Series devices associated with a connector are not shown in the Perimeter Firewall field. However, they are considered as perimeter firewalls.</p> <p>NOTE: If a branch SRX Series device is added and selected as a perimeter firewall, system reboots and a warning message is shown before rebooting the system.</p>

Understanding Juniper SDSN for VMware NSX Integration

IN THIS SECTION

- VMware NSX Overview | 311
- vSRX Integration with NSX Manager and Junos Space Security Director | 311
- High-Level Workflow | 312

This section presents an overview of how Juniper Networks vSRX Virtual Services Gateway integrates in the VMware NSX environment as an advanced security service with Junos Space Security Director as its security manager.

VMware NSX Overview

VMware NSX is VMware's network virtualization platform for the software-defined data center (SDDC). Similar in concept to server virtualization, network virtualization decouples network functions from physical devices. With VMware NSX, existing networks are immediately ready to deploy a software-defined data center. This enables data center operators to create, provision, and manage their networks with greater agility and operational efficiency. VMware NSX is completely managed by the VMware vCenter Server through the VMware vSphere Web Client.

The VMware NSX network virtualization platform is security orientated. The NSX Distributed Firewall (DFW) on all ESXi hosts to provide a set of kernel-based Layer 2 (L2) through Layer 4 (L4) stateful firewall features inside the ESXi hypervisor to deliver segmentation within each virtual network. Every virtual machine (VM) running in a VMware NSX environment can be protected with a full stateful firewall at a granular level. DFW operates at the vNIC of each individual VM.

VMware NSX, however, does not provide advanced L4 through L7 security services which are critical to provide complete protection in a SDDC environment. Environments that require advanced, application-level network security capabilities can leverage VMware NSX to distribute, enable, and enforce advanced network security services in a virtualized network context.

You can add the vSRX Virtual Services Gateway as a partner security service in the VMware NSX environment. The vSRX security service is managed by the Junos Space Security Director and VMware NSX Manager to deliver a complete and integrated virtual security solution for your SDDC environment. The vSRX provides advanced security services, including intrusion detection and prevention (IDP), and application control and visibility services through AppSecure.

DFW implements a stateful *traffic steering* mechanism that identifies what traffic should be sent to the vSRX VM. The protected VMs and the security service vSRX VM run on the same physical ESXi host.

vSRX Integration with NSX Manager and Junos Space Security Director

To deploy the advanced security features of the vSRX Virtual Services Gateway in the VMware NSX environment, the Junos Space Security Director, vSRX, and NSX Manager operate together as a joint solution to fully automate the provisioning and deployment of the vSRX to protect applications and data from advanced cyberattacks.

Integration of the vSRX VM in the VMware NSX environment involves use with the following management software:

- Junos Space Security Director—The centralized security management platform responsible for service registration and configuration of each vSRX instance. The Security Director provides you with the ability to manage a distributed network of virtualized and physical firewalls from a single location. The Security Director functions as the management interface between the NSX Manager and the vSRX Services Gateway. Security Director manages the firewall policies on all vSRX instances.

- **NSX Manager**—The centralized network management component of VMware NSX. The NSX Manager provides integration with the VMware vCenter Server, which enables you to manage the VMware NSX environment through VMware vCenter. All VMware NSX operations and configuration is done through VMware vCenter, which communicates with the NSX Manager through Representational State Transfer (REST) APIs to delegate tasks to the responsible owner. The NSX Manager is always associated with a VMware vCenter Server.

The NSX Manager is added as a registered device in the Security Director and communication is bidirectionally synchronized by the Junos Space Policy Enforcer between the two management platforms. All shared objects (such as security groups) are synchronized between the NSX Manager and Security Director. This includes the IP addresses of all VMs in ESXi hosts, including the vSRX agent VMs. The Security Director creates an address group for each security group synchronized from the NSX Manager, along with the addresses of each member of the security group. The security groups discovered from the NSX Manager are mapped to dynamic address groups (DAG) in the Security Director. The Policy Enforcer retains the mapping of all IP addresses between security groups and dynamic address groups.

The vSRX Services Gateway is deployed as a partner service appliance in the VMware NSX environment. vSRX agent VMs are deployed for each ESXi host in a cluster. You use security policies to direct all VM traffic in an ESXi host through the vSRX VM (the Juniper security service) for L4 through L7 advanced security analysis.

High-Level Workflow

[Figure 32 on page 313](#) provides a high-level workflow of how the NSX Manager, Security Director, and vSRX interact to deploy vSRX as a security service in the VMware NSX environment.

Figure 32: vSRX, Security Director, and VMware NSX Integration Workflow

1. The Junos Space Security Director initiates communication with the NSX Manager. The Security Director discovers, registers, and adds the NSX Manager as a device in its database. The Security Director also deploys the vSRX instance from the .ovf file and registers it as a security service. The NSX Manager and its inventory of shared objects (for example, security groups) and addresses are then synchronized with the Security Director. The registration process uses the Policy Enforcer to enable bidirectional communication between the Security Director and the NSX Manager.
2. The NSX Manager deploys the registered vSRX instance as a Juniper security service for each ESXi host in a vSphere cluster. The deployment is based on the vSRX .ovf file. Whenever an ESXi host is added to a vSphere cluster, NSX Manager creates a vSRX agent VM in the new ESXi host. The same process occurs if an ESXi host is removed from a vSphere cluster.
3. After the vSRX agent VM is provisioned as a security service on each ESXi host in a vSphere cluster, NSX Manager notifies Security Director by using REST API callbacks. The Security Director pushes the initial boot configurations and Junos OS configuration policies to each vSRX agent VM to support the NSX security group. The Security Director is aware of the NSX security groups and corresponding address groups, and all deployed vSRX agent VMs are automatically discovered (one per ESXi host). Security policies redirect relevant network traffic originating from the VMs in a specific security group in the ESXi hosts in a vSphere cluster to the Juniper security service vSRX agent VM in each ESXi host for further analysis.

4. The vCenter Server and the NSX Manager continue to send real-time updates on changes in the virtual environment to Security Director.
5. The Security Director dynamically synchronizes the object database to all vSRX agent VMs deployed in ESXi clusters. Security groups discovered from NSX Manager are mapped to a dynamic address group (DAG) in Security Director. The Security Director manages the firewall policies on the vSRX agent VMs. Using the Security Director, you create advanced security service policies (for example, an application firewall policy or an IPS policy) and push those policies to each vSRX agent VM in an ESXi host.

RELATED DOCUMENTATION

[NSX](#)[VMware NSX Data Sheet](#)[Junos Space Security Director](#)[vSRX](#)

Before You Deploy vSRX in VMware NSX Environment

Before you begin deploying the vSRX Virtual Services Gateway as an advanced security service in VMware NSX:

- Download the **.ovf** file of the vSRX software image from [Juniper Networks website](#) and save it to the Policy Enforcer. The vSRX OVF URL automatically appears in the Register Security Service page of the Security Director when you register the vSRX virtual machine (VM) as a Juniper security service on the NSX Manager.
- Obtain the Juniper SDSN for NSX license key (see [“Juniper SDSN for VMware NSX Licensing” on page 316](#)).
- Install two or more VMware ESXi hosts. See the VMware documentation for details.
- Install the VMware vCenter Server on a Windows VM or physical server, or deploy the VMware vCenter Server Appliance. Connect to the vCenter Server from the vSphere Web Client. See the VMware documentation for details.
- Create a vSphere distributed switch (VDS) in the vSphere environment, add each ESXi host to a common VDS, and then configure the ESXi hosts in a vSphere cluster. For each host cluster that will participate in NSX, all hosts within the cluster must be attached to a common VDS. See the VMware documentation for details.

- Deploy VMs on each ESXi host by using the vSphere Web Client. See the VMware documentation for details.
- Install the VMware NSX Manager in your vCenter Server environment by using the vSphere Web Client. The NSX Manager is the centralized network management component of NSX, and is installed as a virtual appliance on any ESXi host in your vCenter Server environment. It provides an aggregated system view. See the VMware documentation for details.

NOTE: Ensure that NSX Manager is configured in single vCenter Mode and not in multiple vCenter mode. See the VMware documentation for details.

Table 131 on page 315 lists the system software requirement specifications for the components of a vSRX, Security Director, and VMware NSX integration.

Table 131: System Software Specifications for vSRX in VMware NSX Environment

Component	Specification
VMware ESXi Server	6.0 Update 3 or later
VMware vCenter Server	6.3.1 or later
VMware NSX for vSphere	6.3.1 or later NOTE: For sites that are running vSphere 6.5, vSphere 6.5a is the minimum supported version with NSX for vSphere 6.3.0.
VMware NSX Manager	6.3.1 or later
Linux Kernel	3.10.x or later
Junos Space Security Director	17.1 or later
Junos Space Policy Enforcer	17.1 or later
vSRX	Junos OS Release vSRX 15.1X49-D100 or later Junos OS Release vSRX 15.1X49-D101 or later Junos OS Release 17.4R1 or later
Memory	4 GB
Disk space	16 GB (IDE or SCSI drives)

Table 131: System Software Specifications for vSRX in VMware NSX Environment *(continued)*

Component	Specification
vCPUs	2 vCPUs
vNICs	<p>A single vNIC for management traffic. Network traffic is forwarded to the vSRX over a Virtual Machine Communication Interface (VMCI) communication channel by the ESXi hypervisor.</p> <p>NOTE: VMCI is not a network interface (NIC) but a VMWare-proprietary device for Host to Guest Communication.</p>

Juniper SDSN for VMware NSX Licensing

IN THIS SECTION

- [Juniper SDSN for VMware NSX Advanced Security Licenses | 317](#)
- [License Duration | 318](#)
- [License Procurement and Installation | 318](#)

VMware NSX is VMware's network virtualization platform for the Software Defined Data Center (SDDC). You can add the vSRX Virtual Services Gateway as a partner security service in the VMware NSX environment. The vSRX security service is managed by the Junos Space Security Director and VMware NSX Manager to deliver a complete and integrated virtual security solution for your SDDC environment. The vSRX provides advanced security services (Layer 7 services), including intrusion detection and prevention (IDP), and application control and visibility services through AppSecure.

The Juniper SDSN for VMware NSX licensing includes support for Juniper's virtual firewall (vSRX), Network Security services (AppSecure, IDP) and the Juniper SDSN and Security Management solutions (Policy Enforcer and Security Director) for VMware NSX-based private cloud advanced security.

Juniper SDSN for VMware NSX Advanced Security Licenses

The SDSN for NSX Advanced Security (ADS) licenses that are available from Juniper Networks provide entitlement for protection of one physical CPU socket, with one vSRX instance key provided for each license. Typically, a VMware ESXi server has multiple CPU sockets, and each CPU socket has multiple cores.

All Juniper SDSN for NSX ADS licenses have an associated time duration; you purchase licenses as subscription based for a 1-year, 3-year, or 5-year duration.

NOTE: A Juniper SDSN for NSX ADS license cannot be purchased as a perpetual (never expire) license. Each license is only available on a subscription basis.

Each license includes support for the following:

- Juniper vSRX Series Virtual Services Gateway, including:
 - Stateful L3-L4 firewall
 - Advanced Application Security (ASEC) features (such as AppID, AppFW, AppQoS, and AppTrack)
 - Intrusion Detection and Prevention (IDP)
- Juniper Security Management solutions, including:
 - Junos Space Security Director
 - SDSN Policy Enforcer

The licenses available in the Juniper SDSN for VMware NSX ADS licensing model are based on SKUs which represent the terms of subscription and the supported features.

[Table 132 on page 318](#) describes the various license packages.

Table 132: Juniper SDSN for VMware NSX ADS Licensing Packages

License Model Number	Description
JNSX-ADS-1-1Y	<p>Juniper SDSN for NSX Advanced Security with vSRX for 1 physical CPU socket - 1 Year Subscription</p> <p>The 1 year subscription license includes support for Security Director, Policy Enforcer, 1 vSRX entitlement for 1 physical CPU socket protection with AppSecure and IDP feature support</p>
JNSX-ADS-1-3Y	<p>Juniper SDSN for NSX Advanced Security with vSRX for 1 physical CPU socket - 3 Year Subscription</p> <p>The 3 year subscription license includes support for Security Director, Policy Enforcer, 1 vSRX entitlement for 1 physical CPU socket protection with AppSecure and IDP feature support</p>
JNSX-ADS-1-5Y	<p>Juniper SDSN for NSX Advanced Security with vSRX for 1 physical CPU socket - 5 Year Subscription</p> <p>The 5 year subscription license includes support for Security Director, Policy Enforcer, 1 vSRX entitlement for 1 physical CPU socket protection with AppSecure and IDP feature support</p>

License Duration

The Juniper SDSN for NSX ADS license model is subscription based. A subscription license is an annual license that allows you to use the licensed software for the matching duration. Subscriptions might involve periodic downloads of content (such as for IDP threat signature files). At the end of the license period, you need to renew the license to continue using it.

Subscription licenses start when you retrieve the license key or 30 days after purchase if you have not retrieved the license key. All subscription licenses are renewable.

License Procurement and Installation

To enable a Juniper SDSN for NSX ADS license, you must purchase, install, and manage the license key that corresponds to the specific terms of each license. The presence of the appropriate software unlocking key on your virtual instance allows you to configure and use that license.

Licenses are usually ordered when the software application is purchased, and this information is bound to a customer ID. If you did not order the licenses when you purchased your software application, contact

your account team or Juniper Networks Customer Care at <https://www.juniper.net/in/en/contact-us/> for assistance. Licenses can be procured from the [Juniper Networks License Management System \(LMS\)](#).

From the Junos Space Security Director you discover the NSX Manager and perform service registration of the vSRX VM with the NSX Manager. The NSX Manager is added as a device in Security Director and its inventory is synchronized with Security Director. Discovering the NSX Manager and registering vSRX as a security service in Security Director are described in detail in [“Deploying the vSRX as an Advanced Security Service in a VMware NSX Environment”](#) on page 331.

As part of the service registration procedure, in the Service Manager Registration section of the Add NSX Manager page, you enter the license key (see [Figure 33 on page 319](#)).

About the NSX Managers Page

To access this page, click Security Director > Devices > NSX Managers.

Use the NSX Managers page to discover the NSX Manager and perform service registration of the vSRX VM with the NSX Manager. The NSX Manager is added as a device in the Security Director and its inventory is synchronized with Security Director.

Before you Begin

1. Install the Policy Enforcer Release 17.1 OVA image.
 - a. After the installation is complete, log in to the Policy Enforcer VM through SSH. Run the service commands to verify the status of the following services:

```

service nsxmicro status
service  sd_event_listener status
service nsx_callback_listener status
service  ssh_listener status

```

b. If services are stopped, initiate the services again by running the following commands:

```

service nsxmicro start
service  sd_event_listener start
service nsx_callback_listener start
service  ssh_listener start

```

2. Select **Security Director > Administration > Policy Enforcer > Settings**, and add Policy Enforcer to Security Director. For more information, see [Identifying the Policy Enforcer Virtual Machine In Security Director](#).
3. Download the SSH Key. Copy the vSRX OVA file to the Policy Enforcer VM along with the downloaded SSH key. See [“Downloading the SSH Key File” on page 321](#).
4. Obtain the vSRX license key before adding the NSX Manager to the Security Director.

Tasks You Can Perform

You can perform the following tasks from this page:

- Download the SSH Key. See [“Downloading the SSH Key File” on page 321](#).
- Add the NSX Manager. See [“Adding the NSX Manager” on page 323](#).
- Register security services. See [“Registering Security Services” on page 325](#).
- Delete the NSX Manager. See [“Deleting the NSX Manager” on page 328](#).
- Synchronize the NSX inventory.

Field Descriptions

[Table 133 on page 320](#) provides guidelines on using the fields on the NSX Managers page.

Table 133: Fields on the NSX Managers Page

Field	Description
Hostname/IP Address	Specifies the hostname or the IPv4 address of the NSX Manager.

Table 133: Fields on the NSX Managers Page (*continued*)

Field	Description
Name	Specifies the name of the NSX Manager.
Associated vCenter	Specifies the hostname or the IP address of the vCenter associated with the NSX Manager that is automatically fetched by Security Director.
Associated vCenter Status	Specifies the connection status of an associated vCenter.
Service Manager Registration Status	Specifies the registration status of the security services.
Services	Specifies the service definition of a selected NSX Manager. Click View to view the service definition.
Port	Specifies the port number of the NSX Manager.
Username	Specifies the username of the NSX Manager. The user must have the administrator privileges to access the NSX Manager.
Connection Status	Specifies the connection status of the NSX Manager.

Downloading the SSH Key File

You must copy the vSRX OVA image to the Policy Enforcer virtual machine (VM) before adding the NSX Manager.

Use the Upload Image page to download the SSH key file and copy the vSRX OVA file to the Policy Enforcer VM by using the SFTP command with the downloaded SSH key. You must perform this as a first step before adding the NSX Manager.

To download the SSH key:

1. Select **Security Director > Devices > NSX Managers**.

The NSX Managers page appears.

2. Click **Download SSH Key**.

The Download SSH Key page appears.

3. Click **Download SSH Key**.

The SSH key is downloaded and saved in your local drive.

Copying vSRX OVA Image File to Policy Enforcer from Linux Machines

To copy the vSRX OVA file to a Policy Enforcer VM from a Linux machine:

1. Copy the downloaded SSH key file to the same directory where the vSRX OVA image file is saved.
2. Navigate to the directory path where vSRX OVA and SSH key files are located.
3. Run the **chmod 600 <<SSHKEYFILE>>** command to change the permission of the SSH key file.
4. Run the following commands:

- **sftp -o "IdentityFile=<<SSHKEYFILE>>" nsxmicro@<<pe_ipaddress>>**
- **cd publish**
- **put <<VSRX OVA FILE>>**

The vSRX OVA file will be copied to the Policy Enforcer VM after sometime.

5. After the vSRX OVA file is copied, you can add the NSX Manager and register its services in the Security Director.

Copying vSRX OVA Image File to Policy Enforcer from MAC Machines

To copy the vSRX OVA file to a Policy Enforcer VM from a MAC machine:

1. Copy the downloaded SSH key file to the same directory where the vSRX OVA image file is saved.
2. Navigate to the directory path where vSRX OVA and SSH key files are located.

3. Run the **chmod 600 <<SSHKEYFILE>>** command to change the permission of the SSH key file.
4. Run the following commands:
 - **sftp -i sshkey nsxmicro@<pe_ip>**
 - **cd publish**
 - **put *<<VSRX OVA FILE>>**

The vSRX OVA file will be copied to the Policy Enforcer VM after sometime.
5. After the vSRX OVA file is copied, you can add the NSX Manager and register its services in the Security Director.

[Before You Deploy vSRX in VMware NSX Environment | 314](#)

[About the NSX Managers Page | 319](#)

[Adding the NSX Manager | 323](#)

Adding the NSX Manager

Use the Add NSX Manager page to add the NSX Manager in to the Security Director database. Based on the NSX details provided, the Security Director automatically fetches the associated VMware vCenter Server hostname from NSX.

To add a NSX Manager:

1. Select **Devices > NSX Managers**.

The NSX Managers page appears.

2. Click the add icon (+)..

The Add NSX Manager page appears.

3. Complete the configuration by using the guidelines in [Table 134 on page 324](#).
4. Click **Finish** to complete the configuration.

After adding the NSX Manager, you must register the vSRX VM as a Juniper security service with the NSX Manager. See [“Registering Security Services” on page 325](#).

Table 134: Fields on the Add NSX Manager Page

Field	Description
Name	Enter the name of the NSX manager.
Host	Enter the IPv4 address of the NSX manager.
Port	Enter the port number of the NSX Manager. The NSX Manager and Security Director use SSL to communicate on TCP port 443.
Username	Enter the username of the NSX Manager to allow Security Director to authenticate the communication.
Password	Enter the password of the NSX Manager to allow Security Director to authenticate the communication.
Description	Enter a description about the NSX Manager; you can use a maximum of 255 characters.
SSL Certificate	View the SSL certificate required to authenticate the NSX Manager.
Accept SSL Certificate	Select this option to accept the SSL certificate. This is a mandatory field.
<i>Service Manager Registration</i>	
SD Username	Enter the username of Security Director to allow the NSX Manager to authenticate its communication with Security Director.
SD Password	Enter the password of Security Director to allow the NSX Manager to authenticate its communication with Security Director.
License Key	Enter the license key of vSRX VM.
<i>Associated vCenter - vCenter Server</i>	
Host	Enter the IPv4 address of the VMware vCenter Server.
Port	Enter the port number of the VMware vCenter Server. Default: 443
Username	Enter the username of the VMware vCenter Server. Security Director uses these credentials to discover the vCenter server and fetch the VM inventory details.

Table 134: Fields on the Add NSX Manager Page (continued)

Field	Description
Password	Enter the password of the VMware vCenter Server. Security Director uses these credentials to discover the vCenter Server and fetch the VM inventory details.
SSL Certificate	View the SSL certificate required to authenticate the vCenter Server.
Accept SSL Certificate	Select this option to accept the SSL certificate. This is a mandatory field.

Registering Security Services

Use the Register Security Service page in Security Director to register a Juniper security service on a specific NSX Manager. After registering the security service from Security Director, log in to the vCenter server and deploy the service from NSX.

To register the Juniper security service:

1. Select **Devices > NSX Managers**.

The NSX Managers page appears.

2. Select the NSX Manager for which service needs to be registered.

3. From the More list or right-click menu, select **Register Security Service**.

The Register Security Service page appears.

4. Complete the configuration by using the guidelines in [Table 135 on page 326](#).

5. Click **Register** to complete the registration.

A confirmation message appears if the registration is successful or not.

To verify if the security service registration is successful, from the vSphere Web Client, click **Networking & Security** and then click **Service Definitions**. In the Service Managers tab, verify that Security Director is listed with the status as In Service.

Table 135: Fields on the Register Security Service Page

Field	Description
Service Name	Enter the name for the Juniper Security Service.
vSRX OVF URL	The vSRX OVF image that you have copied to the Policy Enforcer VM is listed here. Select the vSRX OVF image from the list.
vSRX Root Password	Enter the root password of the vSRX instance. The same root password is set for all the vSRX VMs deployed in NSX.
Description	Enter the description of the Juniper security service registration; you can use a maximum of 255 characters.

Editing NSX Managers

Use the Edit NSX Manager page to edit the information of an already discovered NSX Manager.

To edit the NSX Manager:

1. Select **Devices > NSX Managers**.

The NSX Manager page appears listing all the discovered NSX Managers.

2. Select the NSX Manager that you want to edit, and click the pencil icon.

The Edit NSX Manager page appears, showing the same fields that are displayed when you add the NSX Manager.

3. Edit the NSX Manager fields as needed.

The changes are saved and you are returned to the NSX Managers landing page.

RELATED DOCUMENTATION

Viewing Service Definitions

Use the Service Definitions page to view the list of services registered for the NSX Manager.

To view the service definitions:

1. Select **Devices > NSX Managers**.

The NSX Manager page appears listing all the discovered NSX Managers.

2. In the Services column, click **View** to view the service definitions for the required NSX Manager.

The Service Definitions page appears. Table provides the guidelines on using the fields on this page.

Table 136: Field on the Service Definitions Page

Field	Description
Service Name	Specifies the name of the registered service.
OVF URL	Specifies the vSRX OVF URL.

Table 136: Field on the Service Definitions Page *(continued)*

Field	Description
Version	Specifies the version of the service.

RELATED DOCUMENTATION

Deleting the NSX Manager

Use the Delete NSX Manager option to delete the NSX Manager from the Security Director inventory. Along with NSX Manager, the associated vCenter server is also deleted.

Before You Begin

Before you delete the NSX Manager, perform the following steps:

1. Unbind all bindings of network object from a service profile in VMWare vCenter Server.

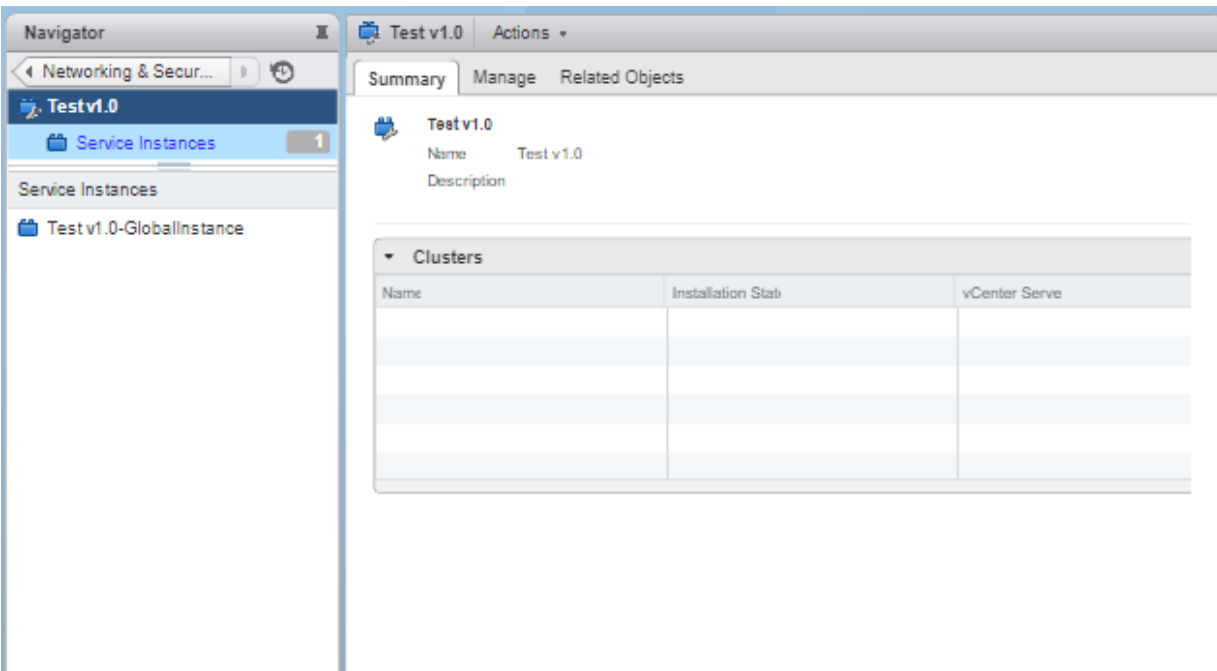

- Log in to the vSphere Web Client through the VMware vCenter Server.
- Select **Networking & Security > Service Definitions**.

The Service Definitions page appears.

- Double-click on the Juniper service.

The respective service page appears, as shown in [Figure 34 on page 329](#).

Figure 34: Service Instances Page

- In the left pane, click on the global instance > Service Profiles > Juniper Vendor Template.

The Juniper Networks Template page for the selected service appears.

- Select the template and from the Actions list, select **Apply to Objects**.

The Apply to Network Objects page appears.

- Remove the object associated with a service profile by moving the object listed under Selected Objects column to Available Objects column.

2. Delete the redirect policy in VMWare vCenter Server.

- Select **Networking & Security > Service Composer**.

The Service Composer page appears.

- In the Security Policies tab, right-click the security policy and select **Delete**.

The security policy along with corresponding firewall rules are deleted.

3. Delete the deployed services in VMWare vCenter Server.

- Select **Networking & Security > Installation**.

The Installation page appears.

- In the Service Deployments tab, right-click on the service name and select **Delete**.

The deployed service is deleted.

4. Deregister the service definition in VMWare vCenter Server.

- Select **Networking & Security > Service Definitions**.

The Service Definitions page appears.

- Double-click on the Juniper service.

The respective service page appears.

- In the left pane, click on the global instance > Service Profiles > Juniper Vendor Template.

The Juniper Networks Template page for the selected service appears.

- In the Related Object tab, right-click on the template and click **Delete**.

- Select **Service Definitions** in the left pane.

The Service Definitions page appears.

- In the Service tab, right-click on the service and click **Delete**.

The Remove service definition pop-up message appears to confirm the delete operation. Enable the Delete service manager option and click **Yes**.

To delete the NSX Manager:

1. Select **Devices > NSX Managers**.

The NSX Manager page appears.

2. Select the NSX Manager that you want to delete.

3. From the More list, or right-click menu, select **Delete NSX Manager**.

A confirmation message appears to confirm the deletion.

NOTE: You cannot delete NSX Manager if the security service is already deployed in NSX.

4. Click **Yes** to confirm the deletion.

The NSX Manager and its associated vCenter server are deleted from the Security Director inventory.

NOTE: You cannot delete a NSX Manager if there is a NSX Secure Fabric. You must first delete the Secure Fabric. See

[Registering Security Services | 325](#)

[Deploying the vSRX as an Advanced Security Service in a VMware NSX Environment | 331](#)

Deploying the vSRX as an Advanced Security Service in a VMware NSX Environment

IN THIS SECTION

- [Creating a Security Group \(VMware vCenter Server\) | 332](#)
- [Discovering the NSX Manager and Registering vSRX as a Security Service in vSphere cluster | 334](#)
- [Deploying vSRX as a Security Service on a vSphere Cluster \(VMware vCenter Server\) | 338](#)
- [Verifying vSRX Agent VM Deployment in Security Director | 342](#)
- [Automatic Creation of Security Policy in the NSX Environment to Direct Traffic Through the vSRX Agent VMs \(VMware vCenter Server\) | 344](#)

Use the following procedures to deploy the vSRX as an advanced security service virtual machine (VM) in the VMware NSX environment. The vSRX VM is deployed in conjunction with Juniper Networks Junos Space Security Director and VMware NSX Manager. In each procedure you are instructed whether to perform the steps in the NSX Manager (from the VMware vCenter Server) or in the vSphere cluster. For example, you create the security group using the NSX Manager, but the discovery of devices happens in the vSphere cluster.

The deployment steps are performed in the following sequence :

Creating a Security Group (VMware vCenter Server)

You create a security group by using the NSX Manager from the VMware vCenter Server. Each security group is a logical collection of objects from your vSphere inventory. These objects include VMs that you want to be members in the same security group and to which you will apply the vSRX as a Juniper security service. You can apply an advanced security service policy to all the objects contained in a security group.

To create a security group from the VMware vCenter Server:

1. Log in to the vSphere Web Client through the VMware vCenter Server.
2. From the vSphere Web Client, click **Hosts and Clusters** to view hosts and clusters in the vSphere Web Client inventory. From the Summary tab, you can verify the vSphere cluster and the VMs associated as part of this cluster. All VMs are part of the VXLAN network and can communicate over this VLAN.
3. From the vSphere Web Client, click **Networking & Security** and then click **Service Composer**. The Service Composer appears. From the Service Composer, click the **Security Groups** tab.
4. Click the **Add Security Group** icon to create a new security group that contains the specific VMs you want as members of the same group, as shown in [Figure 35 on page 333](#).

Figure 35: Create a New Security Group Page

The screenshot shows a window titled "New Security Group" with a sidebar on the left and a main content area on the right. The sidebar contains a list of five steps, each with a green checkmark: "1 Name and description", "2 Define dynamic membership", "3 Select objects to include", "4 Select objects to exclude", and "5 Ready to complete". The main content area is titled "Name and description" and contains three input fields: "Name:" with the value "SG1", "Description:" (empty), and "Scope:" with the value "Global". At the bottom right of the window are four buttons: "Back", "Next", "Finish", and "Cancel".

5. Type a name and description for the security group and then click **Next**.
6. On the Define dynamic membership page, define the criteria that an object must meet for it to be added to the security group you are creating. You can define a dynamic group membership criteria for the VMs that are to be part of each security group. For example, VM membership in a security group can be tagged by name. You define the exact membership criteria that you want to use to group VMs. Group membership is associated dynamically at runtime.
Click **Next**.
7. On the Select objects to include page, select the tab for the resources you want to include in this security group. Click **Next**.
8. On the Select objects to exclude page, select the tab for the resources you want to exclude from this security group. Click **Next**.
9. Click **Finish** to complete creating the security group.

Discovering the NSX Manager and Registering vSRX as a Security Service in vSphere cluster

You use the Junos Space vSphere cluster to discover the NSX Manager and perform service registration of the vSRX VM with the NSX Manager. The NSX Manager is added as a device in the Security Director, and its inventory is synchronized with the Security Director.

NOTE: Ensure that SNMP is disabled in the Security Director while performing device discovery for the vSRX agent VM. If SNMP is enabled in Security Director, the vSRX agent VM discovery operation fails.

To discover the NSX Manager from the Security Director:

1. Select **Security Director > Devices > NSX Managers**.

The NSX Managers page appears.

2. Click the **Add icon (+)** to add the NSX Manager to the Security Director.

The Add NSX Manager page appears, as shown in [Figure 36 on page 334](#).

Figure 36: Add NSX Manager Page

Add NSX Manager ⓘ

3. In the NSX Manager section, enter the following information:

- Name—Enter the name of the NSX Manager.
- Host—Enter the IP address of the NSX Manager.
- Port—Enter the port number of the NSX Manager. The NSX Manager and Security Director use SSL to communicate on TCP port 443.
- Username, Password—Enter the username and password of the NSX Manager that are required for communication to be authenticated by the Security Director.
- Description—Enter a description for the NSX Manager you are to add to the Security Director.
- SSL Certificate—View the SSL certificate to authenticate the NSX Manager and select the Accept SSL Certificate option to accept the SSL certificate.

This is a mandatory field to discover the NSX Manager. The SSL Certificate field appears once you enter the NSX details.

4. Click **Next**.

5. In the Service Manager Registration section, enter the following details about the Security Director:

- SD Username, SD Password—Enter the username and password of Security Director to allow the NSX Manager to authenticate communication to the Security Director.
- License Key—Enter the license key for the previously procured Juniper SDSN for NSX license (see [“Juniper SDSN for VMware NSX Licensing” on page 316](#) for background details).

6. Click **Next**.

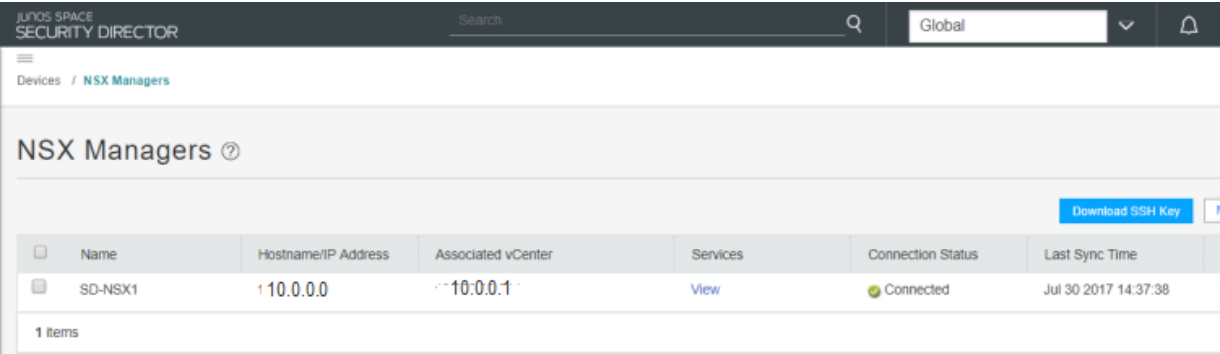

7. In the vCenter Server section, provide the following details about the vCenter Server:

- Host—Enter the IP address of the VMWare vCenter Server.
- Port—Enter the port number of the VMWare vCenter Server. By default, 443 is used.
- Username, Password—Enter the username and password of the VMware vCenter Server. Security Director uses these credentials to discover the vCenter Server and fetch the VM inventory details.
- SSL Certificate—View the SSL certificate to authenticate the vCenter Server and select the Accept SSL Certificate option to accept the SSL certificate. To discover the vCenter Server, it is mandatory to accept the certificate.

8. Click **Finish**.

The Summary page of configuration changes appears. Click **OK** to add the NSX Manager. When you return to the NSX Managers page, you will see the discovered NSX Manager listed, as shown in [Figure 37 on page 336](#).

Figure 37: NSX Managers Page

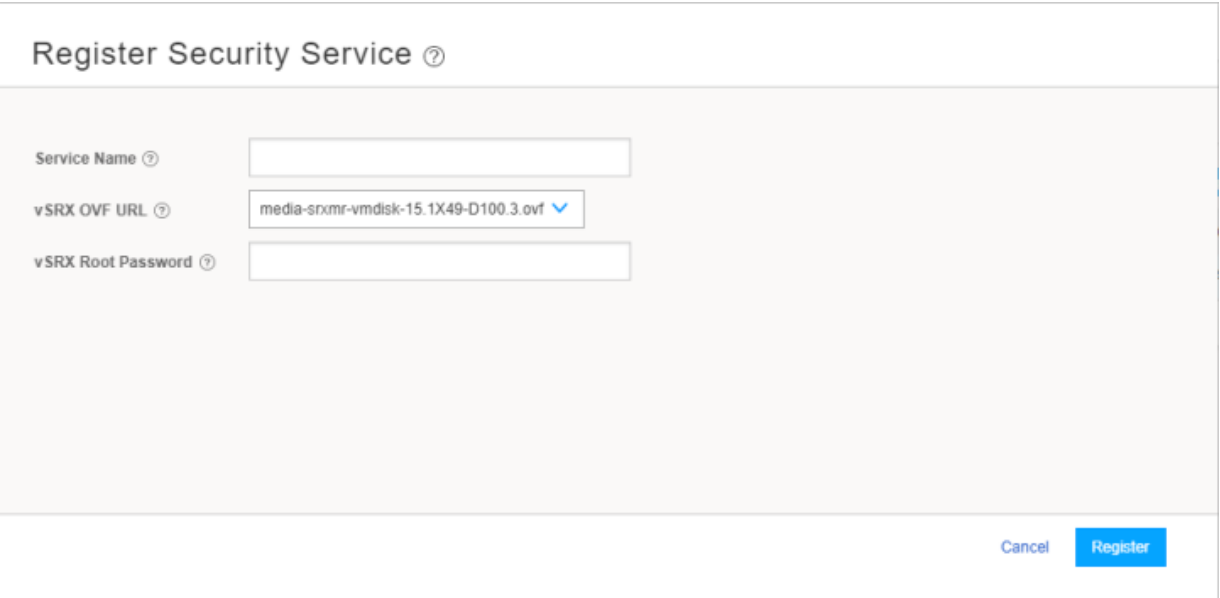

After adding the NSX Manager, you must register the vSRX VM as a Juniper security service with the NSX Manager.

To register the vSRX instance as a Juniper security service:

1. Select the NSX Manager for which service needs to be registered, right-click or from the More list, select **Register Security Service**.

The Register Security Service page appears, as shown in [Figure 38 on page 336](#).

Figure 38: Register Security Service Page

2. In the Service Name field, enter the name of the Juniper security service.
3. From the vSRX OVF URL list, select the available vSRX OVF image that you copied to the Policy Enforcer machine.

- 4. In the vSRX Root Password field, enter the root password of the vSRX instance. The same root password will be set for all the vSRX instances deployed in NSX.
- 5. In the Description field, enter a description.
- 6. Click **Register**.

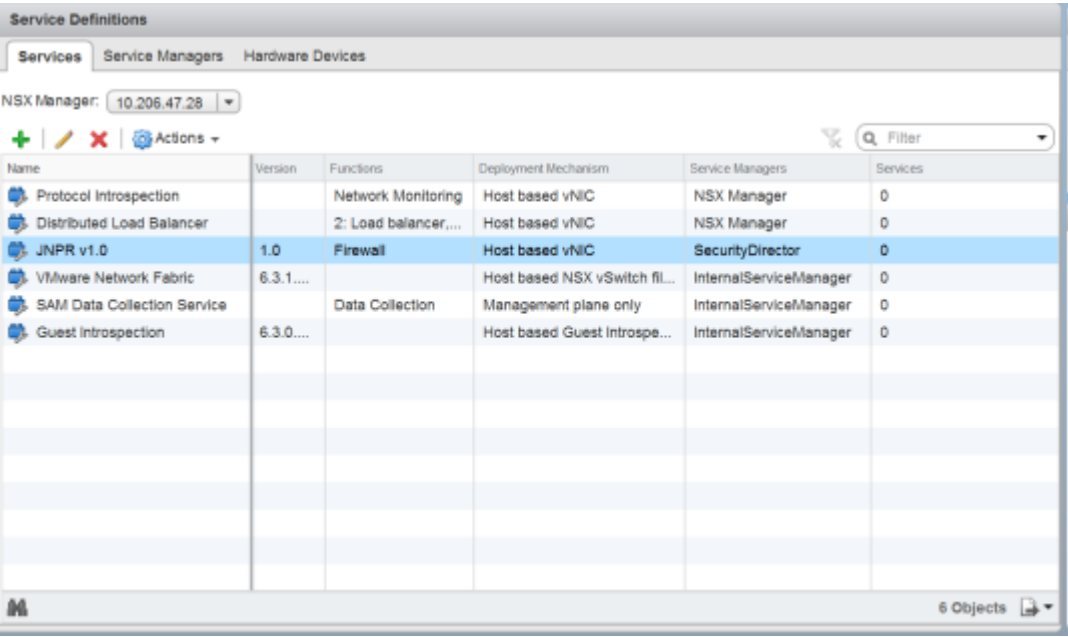

A confirmation message indicates whether the registration is successful or not.

The vSRX instance registered as a new service in the vSphere Web Client environment. The vSRX is added as a network service that can be deployed by the NSX Manager.

In the vSphere Web Client, verify the following:

- Click **Networking & Security** and then click **Service Definitions**. Click the **Services** tab and verify that `<service-name> v1.0` is listed in the table (the newly registered vSRX VM) along with the Security Director as the Service Manager, as shown in [Figure 39 on page 337](#).

Figure 39: Service Definitions Page

Name	Version	Functions	Deployment Mechanism	Service Managers	Services
Protocol Introspection		Network Monitoring	Host based vNIC	NSX Manager	0
Distributed Load Balancer		2: Load balancer,...	Host based vNIC	NSX Manager	0
JNPR v1.0	1.0	Firewall	Host based vNIC	SecurityDirector	0

SAM Data Collection Service		Data Collection	Management plane only	InternalServiceManager	0
Guest Introspection	6.3.0....		Host based Guest Introspe...	InternalServiceManager	0

- Click the **Service Managers** tab and verify that the Security Director is listed with a status of **In Service**, as shown in [Figure 40 on page 338](#).

Create a static IP pool with a primary DNS for the vSRX. This is a mandatory step before you deploy the vSRX agent VM.

1. From the vSphere Web Client, select **Networking & Security** and then **NSX Managers**.
2. In the Navigator column, select the name of the NSX Manager and click **Manage > Grouping Objects > IP Pools**.
3. Click the **Add icon (+)** to add the static IP pool.

The Add Static IP Pool page appears, as shown in [Figure 41 on page 339](#).

Figure 41: Add Static IP Pool Page

Add Static IP Pool

Name: *

Gateway: *
A gateway can be any IPv4 or IPv6 address.

Prefix Length: *

Primary DNS:

Secondary DNS:

DNS Suffix:

Static IP Pool: *
for example 192.168.1.2-192.168.1.100 or

OK Cancel

4. In the Name field, provide a name for the IP pool.
5. In the Gateway field, provide a default gateway IP address.
6. In the Prefix Length field, provide a prefix length of the DNS.
7. Provide the primary and secondary DNS and the DNS suffix . This is a mandatory field.
8. In the Static IP Pool field, provide the IP address ranges to be included in the pool.
9. Click **OK**.

A new IP pool is created for the vSRX to be deployed.

To deploy the vSRX agent VM as a security service for a vSphere cluster:

1. From the vSphere Web Client, click **Networking & Security** and then click **Installation**.

The Installation page appears.

2. Click the **Service Deployments** tab and then click the **New Service Deployment (+)** icon. The Deploy Network & Security Services page appears, as shown in [Figure 42 on page 340](#).

Figure 42: Deploy Network and Security Services Page

Deploy Network & Security Services

1 Select services & schedule
2 Select clusters
3 Select storage and Management Network
4 Ready to complete

Select services & schedule
Select one or more Network & Security services to deploy. You can also specify the schedule for deployment.

Select services:

<input type="checkbox"/>	Name	Description	Category
<input checked="" type="checkbox"/>	JNPR v1.0		
<input type="checkbox"/>	Guest Introspection	Base service for all solutions based o...	
<input type="checkbox"/>			
<input type="checkbox"/>			
<input type="checkbox"/>			
<input type="checkbox"/>			
<input type="checkbox"/>			
<input type="checkbox"/>			
<input type="checkbox"/>			
<input type="checkbox"/>			

Specify schedule:
☒ Deploy now ☐ Schedule the deployment 11:52 AM

Back Next Finish Cancel

3. From the Select services & schedule page, select `<service-name> v1.0` as the service to deploy and then click **Next**.
4. From the Select clusters page, select the data center and one or more clusters on which the vSRX agent VM is to be deployed, and then click **Next**.
5. From the Select storage and Management Network page:
 - Select the datastore on which to allocate shared storage for the vSRX agent VM, as shown in [Figure 43 on page 341](#). ESXi hosts should be configured so that they can access shared storage. If you select **Specified on-host**, ensure that the datastore for the ESXi host is specified in the **Agent VM Settings** of the ESXi host in the cluster. See the VMware documentation for details.

Figure 43: Select Storage and Management Network Page

[illegible]

- Select the network that you intend to use for traffic to the vSRX agent VM. If you select **Specified on-host**, ensure that the network to be used is specified in the **Agent VM Settings > Network** property of the ESXi host in the cluster. See the VMware documentation for details.

NOTE: The datastore and network must be configured for each ESXi host in the cluster.

For IP assignment, you can choose an IP pool to assign a range of IP addresses from a selected static IP pool or create a new static IP pool.

- Click **Next** to access the Ready to complete page, and then click **Finish** to publish the changes and deploy the vSRX agent VM security services to the specified cluster. From the Service Deployments tab, you will see that the Juniper security service has been successfully deployed on the selected vSphere cluster.
- From the vSphere Web Client, click **Hosts and Clusters** and verify that vSRX agent VMs are listed as *service-name* v1.0 in the vSphere Web Client inventory and created for each ESXi host in the vSphere cluster.

NOTE: *service-name* is the name provided at the time of service registration.

8. The Security Director automatically discovers all the deployed vSRX VM agents by using the device-initiated discovery. A new firewall and IPS group policies are created and all devices are assigned to these group policies.

NOTE: The Security Director creates predefined IPS policies with a single IPS template. You can either add more IPS templates or convert the predefined IPS policies to custom IPS policies.

When you add an ESXi host in the vSphere cluster, NSX Manager automatically detects that the new ESXi host and adds the Juniper security service vSRX agent VM for it.

Verifying vSRX Agent VM Deployment in Security Director

In the Security Director, based on the NSX Manager discovery, NSX security groups are automatically synchronized with Security Director. For each service group in NSX Manager, Security Director creates a corresponding dynamic address group.

To verify that the vSRX agent VMs have been properly deployed:

1. Select **Security Director > Devices > NSX Managers**.

The NSX Managers page appears with the discovered NSX Manager and the vSRX instance registered as a new service in the vSphere Web Client environment.

2. Select **Security Director > Monitor > NSX Inventory > Security Groups**.

The Security Groups page appears listing all the security groups obtained from NSX and the corresponding dynamic address groups created by the Security Director, as shown in [Figure 44 on page 343](#).

Automatic Creation of Security Policy in the NSX Environment to Direct Traffic Through the vSRX Agent VMs (VMware vCenter Server)

After you deploy vSRX agent VM security services to the ESXi hosts in a vSphere cluster, security policies are automatically created to redirect any network traffic originating from the VMs in a specific security group to the Juniper security service vSRX agent VM residing in the ESXi host for further analysis.

To direct the traffic to the vSRX agent VMs in each ESXi host by using the automatically created security policies:

1. In the Security Director, install the IPS signature to all the vSRX VM agents.
2. On the Firewall and IPS Policies page, add new rules to the automatically created firewall or IPS policies with respective dynamic address groups, as shown in [Figure 46 on page 345](#). You can also use the application firewalls in the firewall rules.

Figure 46: Firewall Policy Rules Page

Seq	Hit Count	Rule Name	Src. Zone	Src. Address	User ID	Dest. Zone	Dest. Address	Service	Action	Advance...	Rule Opti
▼ ZONE (2 Rules)											
1	0	testNSX	securewire...	NSX1-rt	-	securewi...	NSX1-hjh	Any	Permit	-	Profile
2	0	testNSX-1	securewire...	NSX1-yup	-	securewi...	NSX1-testSG	Any	Permit	-	Profile
▼ GLOBAL (0 Rule)											

- After creating policy rules, publish and update the firewall and IPS policies.
- After the firewall and IPS policies are successfully updated in the Security Director, log in to the vSphere Web Client to verify the security policies in NSX Manager.

Select **Network & Security > NSX Managers**, and the Navigator column, select the NSX Manager name. The security policies are automatically created in NSX Manager by Security Director, as shown [Figure 47 on page 345](#).

Figure 47: NSX Security Groups Page

pmphilip-lsycoldCluster_root	10.206.33.5	12.3X48-D40.5	15.1X49-D100.3 [Mismatch ...	NA	NA	NA	down
LSYS-3oldCluster_root	10.206.33.5	12.3X48-D40.5	15.1X49-D100.3 [Mismatch ...	NA	NA	NA	down

The NSX Manager is aware of the security groups that the Juniper security service monitors. If any changes occur in the security group, the NSX Manager notifies the Security Director about those changes. If membership changes, the NSX Manager notifies the Security Director of the changes and the Security Director updates its database based on the new membership.

vCenter Servers

IN THIS CHAPTER

- [About the vCenter Servers Page | 348](#)

About the vCenter Servers Page

To access this page, select Security Director > Devices > vCenter Servers.

VMWare NSX Manager is always associated to a vCenter Server. Based on the NSX Manager discovered by Security Director, the NSX service automatically fetches the associated vCenter server hostname. The NSX service uses the specific vCenter credentials provided by the user at the time of adding the NSX Manager, to connect to vCenter and obtain any required inventory from it.

Use the vCenter Servers page to view details of an associated vCenter Server.

Tasks You Can Perform

You can perform the following task from this page:

- Synchronize any changes to the inventory objects in vCenter with the vCenter database.

Field Descriptions

[Table 137 on page 348](#) provides guidelines on using the fields on the vCenter Servers page.

Table 137: Fields on the vCenter Servers Page

Field	Description
Host Name	Specifies the hostname of the associated vCenter Server.
Port	Specifies the port number of the vCenter server.
Connection Status	Specifies the connection status of NSX Manager and associated vCenter server.

Firewall Policies Overview

Security Director provides you with four types of firewall policies:

- **Device Policy**—Type of firewall policy that is created per device. This type of policy is used when you want to push a unique firewall policy configuration per device. You can create device rules for a device firewall policy.

Security Director views a logical system like it does any other security device, and it takes ownership of the security configuration of the logical system. In Security Director, each logical system is managed as a unique security device.

During a device assignment for a device policy, only devices from the current domain are listed.

NOTE: If Security Director discovers the root logical system, the root lsys discovers all other user lsys inside the device.

Security Director allows a device to have a device-specific policy and to be part of multiple group policies. Rules for a device are updated in the following order:

- Rules within **Policies Applied Before 'Device Specific Policies'**
- Rules within **Device-Specific Policies**
- Rules within **Policies Applied After 'Device Specific Policies'**

Rules within **Policies Applied Before 'Device Specific Policies'** take priority and cannot be overridden. However, you can override rules within **Policies Applied After 'Device Specific Policies'** by adding an overriding rule in the **Device-Specific Policies**. In an enterprise scenario, “common-must-enforce” rules can be assigned to a device from the **Policies Applied Before 'Device Specific Policies'**, and “common-nice-to-have” rules can be assigned to a device from the **Policies Applied After 'Device Specific Policies'**.

NOTE: An exception can be added on a per device basis in “Device-Specific Policies” . For a complete list of rules applied to a device, select **Configure > Firewall Policy > Devices**. Select a device to view rules associated with that device.

All devices policy enables rules to be enforced globally to all the devices managed by Security Director. All devices policy is part of the Global domain and is visible in all the child domains if the view parent is enabled.

- **Group**—Type of firewall policy that is shared with multiple devices. This type of policy is used when you want to update a specific firewall policy configuration to a large set of devices. You can select the policy placement to be before device specific or after device specific. When a group firewall policy is updated on the devices, the rules are updated in the following order:
 - Rules within **Policies Applied Before 'Device Specific Policies'**
 - Rules within **Device-Specific Policies**

- Rules within **Policies Applied After 'Device Specific Policies'**

During a device assignment for a group policy, only devices from the current and child domains (with view parent enabled) are listed. Devices in the child domain with view parent disabled are not listed. Not all the group policies of the Global domain are visible in the child domain. Group policies of the Global domain (including All device policy) are not visible to the child domain, if the view parent of that child domain is disabled. Only the group policies of the Global domain, which has devices from the child domain assigned to it, are visible in the child domain. If there is a group policy in global domain with devices from both D1 and the Global domains assigned to it, only this group policy of the Global domain is visible in the D1 domain along with only the D1 domain devices. No other devices, that is the Device-Exception policy, of the Global domain is visible in the D1 domain.

You cannot edit a group policy of the Global domain from the child domain. This is true for All Devices policy as well. Modifying the policy, deletion of the policy, managing a snapshot, snapshot policy and acquiring the policy lock is also not allowed. Similarly, you cannot perform these actions on the Device-Exception policy of the D1 domain from the Global domain. You can prioritize group policies from the current domain. Group policies from the other domains are not listed.

The basic settings of a firewall policy are obtained from the policy profile. The basic settings include log options, firewall authentication schemes, and traffic redirection options.

Firewall policies are displayed in a tabular view. You can select a policy and apply rules either inline or using the + icon. For more information, see [“Creating Firewall Policy Rules” on page 362](#).

Policy Ordering Overview

By default, new policies go to the end of a policy lookup list. Therefore, it is possible for one policy to eclipse or overshadow another policy. The order of configured policies is significant in how the device handles traffic. Policy look up is performed in the order that policies are configured. The first policy that matches the traffic is used. If a specific policy is listed after a general policy, it is highly probable that the specific policy will not be used.

For example, if you have two policies configured for the same source zone, destination zone, source IP address, and destination IP address, but one policy has permit-all and one has permit-mail, the policy with permit-mail would never be matched if it is listed after the policy with permit-all.

Because policies execute in the order of their appearance, you must be aware of the following:

- Policy order is important.
- Newly created policies go to the end of the policy list.
- You can change the order of policies.
- The last policy in the policy list is the default policy, which has the default action of denying all traffic.

Reordering a Policy

You can correct policy overshadowing by simply reversing the order of the policies, putting the more specific one first.

NOTE: Policy ordering is extremely important in Virtual Private Networks (VPN) environments. Listing a VPN or encryption policy first ensures that VPN traffic reaches the encryption policy, not a general permit policy.

The S. No. (sequence number) column on the Zone Policy page allows you to reorder the policies:

- Use the S. No. column to type a number to change the policy order.
- Drag and drop a selected policy from one location to another.

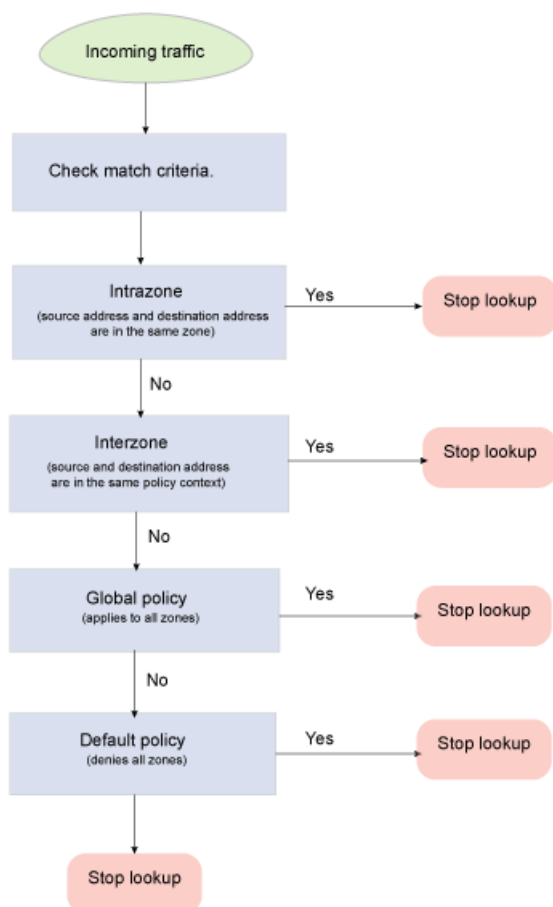

The sequence number changes as you drag the policy or manually type a new sequence number. The sequence numbers of all the policies below the newly moved policy also change.

NOTE: The drag and drop feature is disabled if you have filtered the policy list.

Order of Precedence for Policy Matches

For policy matches, it is important to understand how the firewall evaluates policies. Juniper calls a security policy context the policy that is within the same source-destination zone pair. For instance, all policies within source zone trust and destination zone untrust are in the same context. Figure 1 shows the order in which policies are looked up.

Figure 50: Policy Lookup

In terms of context precedence, SRX Series devices support the following order of precedence:

1. Match intrazone policies: The initial packet in an unknown session is evaluated to determine if the source and destination zones are the same. This occurs if both the ingress and egress interfaces are in the same zone. This context match has the highest precedence and is matched first.
2. Match interzone policies: If the session does not match an intrazone context or policy, then the next policy is for a source zone and destination zone context. If the context matches, then the policies within that context are evaluated for a match. Interzone policies are only evaluated if there is no matching intrazone policy match.
3. Global policies: If there is no policy match for either intrazone or interzone policies, then the next policy match is the global policy. A global policy matches any zone context, but it has the same match criteria for the policies as any other security policy (for example, source IP address, destination address, services, user object, and so forth). It is the last policy set that is evaluated after intrazone and interzone policies.
4. Default action: this action is taken if there is no match on intrazone, interzone, or global policies.

Firewall Policies Overview 353
Creating Firewall Policies 358

Creating Firewall Policies

Use the Create Firewall Policies page to configure group or device policies that determine all the network resources within your organization and that identify the required security level for those resources.

Before You Begin

- Read the Firewall Policies Overview topic.
- Review the firewall policies main page for an understanding of your current data set. See [“Firewall Policies Main Page Fields” on page 387](#) for field descriptions.
- Create source (from-zone) and destination (to-zone) zones.
- Create addresses and address sets.
- Create services (applications) and service sets (application sets).

Configuring Firewall Policy Settings

To create a firewall policy:

1. Select **Configure > Firewall Policy**.
2. Click the + icon.
3. Complete the configuration according to the guidelines provided in [Table 138 on page 358](#).
4. Click **OK**. A firewall policy is created. You can click on the policy to assign rules inline or select the policy and click the + icon to configure policy rules. See [“Creating Firewall Policy Rules” on page 362](#).

A new policy is created according to your configuration. You can use this policy to assign rules, profiles, and schedules. To enable a policy, you must assign it to a domain. See [“Assigning Policies and Profiles to Domains” on page 408](#).

Firewall Policies Best Practices

A secure network is vital to a business. To secure a network, a network administrator must create a security policy that outlines all of the network resources within that business and the required security level for those resources. The policy applies the security rules to the transit traffic within a context (source zone and destination zone) and each policy is uniquely identified by its name. The traffic is classified by matching source and destination zones, source and destination addresses, and the service (application) that the traffic carries in its protocol headers with the policy database in the data plane.

Configuring security policies to enforce traffic rules in a network can be relatively easy but requires careful consideration. There are several best practices to use when defining an effective firewall policy to ensure better use of system memory and to optimize policy configuration:

1. Use least privilege policies—Make the firewall rules as tight as possible in terms of match criteria and permitting traffic. Only permit traffic that is allowed by your organizational policy and deny all other traffic. This is true for both ingress and egress traffic, meaning traffic from the Internet to internal resources and also traffic from internal resources to the Internet. A least privilege security policy helps to minimize the attack surface, making other controls more effective.
2. Segment logically—Zone-based firewalls allow you to place different interfaces into different zones. This allows you to design your network such that you can place resources in a manner where the firewall can enforce controls (interzone and intrazone policies).
3. Place specific firewall rules first—Place the most explicit firewall rules at the top of the rule base because traffic is matched starting at the top of the rulebase and going down with the first match.
4. Use address sets where possible—Address sets simplify administration of firewall policies. They allow you to group large sets of objects so that you can address them as a single object in a security policy. The more rules you can reference to the address sets, the easier it is to make changes because most organizations have logical objects that can be grouped

Use single prefixes for source and destination addresses. For example, instead of using /32 addresses and adding each address separately, use a large subnet that covers most of the IP addresses you require. Use fewer IPv6 addresses because IPv6 addresses consume more memory.

5. Use service sets where possible—Service sets simplify administration of firewall policies. They allow you to group large sets of objects so that you can address them as a single object in a security policy. Use service “any” whenever possible. Each time you define an individual service in the policy, you can use additional memory.
6. Use fewer zone pairs in policy configurations—Each source and destination zone uses about 16,048 bytes of memory. We recommend using global policies wherever possible. Global policies provide you with the flexibility to perform action on traffic without the restrictions of zone specifications.
7. Use explicit drop rules—To ensure that undesired traffic does not leak through a security policy, place an any-any-any drop rule at the bottom of each security zone context (for example, source zone to destination zone) along with a global policy. This does not mean that you should not define your firewall rules, it simply provides a catch-all mechanism for capturing unclassified traffic.
8. Use logging—We highly recommend that you log on all firewall policies. Logging provides you with an audit trail of all network activity, which helps in troubleshooting and diagnosis. Unless you are troubleshooting, it is best to use the Log on Session Close option instead of the Log on Session Initialization option. Session Close logs include a great deal more information about the session; this information is useful for diagnostic purposes.
9. Use Network Time Protocol (NTP)—NTP is a widely used protocol used to synchronize the clocks of routers and other hardware devices on the Internet. If any of the device clocks is wrong, then not only

logs and troubleshooting information can be incorrect, but also security policy objects such as schedulers can have unintended results.

10. Check memory utilization—Check your memory usage before and after compiling policies.

[Creating Firewall Policies](#) | 358

Creating Firewall Policy Rules

Use the Create Rule page to configure firewall rules that control transit traffic within a context (source zone to destination zone). The traffic is classified by matching its source and destination zones, the source and destination addresses, and the application that the traffic carries in its protocol headers with the policy database.

Security Director allows a device to have a device-specific policy and to be part of multiple group policies. Rules for a device are updated in this order:

- Rules within **Policies Applied Before 'Device Specific Policies'**
- Rules within **Device-Specific Policies**
- Rules within **Policies Applied After 'Device Specific Policies'**

Rules within **Policies Applied Before 'Device Specific Policies'** take priority and cannot be overridden. However, you can override rules within **Policies Applied After 'Device Specific Policies'** by adding an overriding rule in the Device-Specific Policies. In an enterprise scenario, “common-must-enforce” rules can be assigned to a device from the **Policies Applied Before 'Device Specific Policies'**, and “common-nice-to-have” rules can be assigned to a device from the **Policies Applied After 'Device Specific Policies'**.

NOTE: An exception can be added on a per device basis in “Device-Specific Policies” . For a complete list of rules applied to a device, select **Configure > Firewall Policy > Devices**. Select a device to view rules associated with that device.

Before You Begin

- Read the Overview Firewall Policies topic.
- Review the Firewall Rules main page for an understanding of your current data set. See [“Firewall Policy Rules Main Page Fields” on page 387](#) for field descriptions.

Configuring Firewall Policy Rule Settings

To configure a firewall policy rule:

1. Select **Configure > Firewall Policy**.
2. Select the policy for which you want to define rules and click the + icon.

The Create Rules page appears.

**NOTE:** To edit and create rules inline, click the policy to make the fields editable.

3. Complete the configuration according to the guidelines provided in [Table 139 on page 363](#).
4. Click **OK**.

The rules you configured are associated with the selected policy.

Table 139: Firewall Policy Rules Setting

Setting	Guideline
<i>General Information</i>	
Rule Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the; maximum length is 63 characters.
Description	Enter a description for the policy rules; maximum length is 1024 characters. Comments entered in this field are sent to the device.
<i>Identify the traffic that the rule applies to</i>	

Table 139: Firewall Policy Rules Setting (continued)

Setting	Guideline
(Source) Zone	<p>For SRX Series devices, specify a source zone (from-zone) to define the context for the policy. Zone policies are applied on traffic entering one security zone (source zone) to another security zone (destination zone). This combination of a source zone and a destination zone is called a context.</p> <p>Starting in Junos Space Security Director Release 16.2, for MX Series routers, the source zone field acts as an ingress interface from where the packet enters. The match direction is input, if the packet is entering the interface. The match direction is output, if the packet is leaving the interface. Configure the ingress key by selecting the aggregated multiservices (AMS) value.</p> <p>Starting in Junos Space Security Director Release 16.2, polymorphic zones can be used as source zone and destination zone, when you assign SRX Series devices and MX Series routers to the same group policy.</p>
(Source) Address(es)	<p>Enter one or more address names or address set names. Click Select to add source addresses.</p> <p>On the Source Address page:</p> <ul style="list-style-type: none"> • Select the Include option to add the selected source addresses or any address to the rule. • Select the Exclude option to exempt the selected source addresses from the rule. • Select the By Metadata Filter option to choose the matching address of a user-defined metadata as the source address. <ul style="list-style-type: none"> • Metadata Filter—Click the field to select the required metadata from the list. The matching addresses are filtered and listed in the Matched Address field. • Matched Addresses—Lists the addresses matching the selected metadata. This address is used as a source address. <p>For every metadata expression, a unique dynamic address group(DAG) is created. This DAG has the feed server URL pointing to the feed server URL of Security Director.</p> <p>Configure the feed server URL by using the following CLI command to each SRX Series device or vSRX that acts on the metadata based policies.</p> <pre>set security dynamic-address feed-server <SD IP Address> hostname <SD IP Address></pre> <p>See “Creating Addresses and Address Groups” on page 775.</p>
(Source) Src. ID	<p>Specify the source identity (users and roles) to be used as match criteria for the policy. You can have different policy rules based on user roles and user groups. Click Select to specify source identities to permit or deny. On the Source ID page, you can select a source identity from the available list or you can make a new identify by clicking Add New Source ID.</p>

Table 139: Firewall Policy Rules Setting (continued)

Setting	Guideline
(Source) End User Profile	<p>Select an end user profile from the list. The firewall policy rule is applied to it.</p> <p>When traffic from device A arrives at an SRX Series device, the SRX Series obtains the IP address of device A from the first traffic packet and uses it to search the device identity authentication table for a matching device identity entry. Then it matches that device identity profile with a security policy whose End User Profile field specifies the device identity profile name. If a match is found, the security policy is applied to traffic issuing from device A.</p>
(Destination) Zone	<p>For SRX Series devices, specify a destination zone (to-zone) to define the context for the policy. Zone policies are applied on traffic entering one security zone (source zone) to another security zone (destination zone). This combination of a source zone and a destination zone is called a context.</p> <p>Starting in Junos Space Security Director Release 16.2, for MX Series routers, this field acts as an egress interface from where the packet enters. The match direction is input, if the packet is entering the interface. The match direction is output, if the packet is leaving the interface. Configure the egress key by selecting the aggregated multiservices (AMS) value.</p> <p>Polymorphic zones can be used as source zone and destination zone, when you assign SRX Series devices and MX Series routers to the same group policy.</p>
(Destination) Address(es)	<p>Select one or more address names or address sets. Click Select to add destination addresses.</p> <p>On the Destination Address page:</p> <ul style="list-style-type: none"> • Select the Include option to add the selected destination addresses or any address to the rule. • Select the Exclude option to exempt the selected destination addresses from the rule. • Select the By Metadata Filter option to choose the matching address of a user-defined metadata as the destination address. <ul style="list-style-type: none"> • Metadata Filter—Click the field to select the required metadata from the list. The matching addresses are filtered and listed in the Matched Address field. • Matched Addresses—Lists the addresses matching the selected metadata. This address is used as a destination address. <p>For every metadata expression, a unique dynamic address group(DAG) is created. This DAG has the feed server URL pointing to the feed server URL of Security Director.</p> <p>Configure the feed server URL by using the following CLI command to each SRX Series device or vSRX that acts on the metadata based policies.</p> <pre>set security dynamic-address feed-server <SD IP Address> hostname <SD IP Address></pre> <p>See “Creating Addresses and Address Groups” on page 775.</p>

Table 139: Firewall Policy Rules Setting (continued)

Setting	Guideline
(Service Protocols) Services	Select one or more service (application) names. Select the Include, Any Service to disable the any option in the services list builder. Clear the Any Service check box to permit or deny services from the services list builder available column. Click Add New Service to create a service. See “Creating Services and Service Groups” on page 783 .
Application Signatures	Click the + icon to add the application signatures. You can add both predefined and custom application signatures.
<i>Advanced Security</i>	
Rule Action	<ul style="list-style-type: none"> • Action applies to all traffic that matches the specified criteria. Deny—Device silently drops all packets for the session and does not send any active control messages such as TCP Resets or ICMP unreachable. • Reject—Device sends a TCP reset if the protocol is TCP, and device sends an ICMP reset if the protocols are UDP, ICMP, or any other IP protocol. This option is useful when facing trusted resources so that the applications do not waste time waiting for timeouts and instead get the active message. • Permit—Device permits traffic using the type of firewall authentication you applied to the policy. • Tunnel—Device permits traffic using the type of VPN tunneling options you applied to the policy.
Advanced Security	<p>Firewall policies provide a core layer of security that ensures that network traffic is restricted to only that which a policy dictates through its match criteria.</p> <p>Firewall policies provide a core layer of security that ensures that network traffic is restricted to only that which a policy dictates through its match criteria. When the traditional policy is not enough, select application identification components to create an advanced security profile for the policy:</p> <ul style="list-style-type: none"> • App Firewall—Select this option to enforce traditional firewall controls on the traffic while layering application firewall to ensure that applications conform not only to the port information but also to what is transmitted between a client and a server. You can permit, deny, and reject applications. There is also a special redirect feature for HTTP and HTTPS. • SSL Forward Proxy—Select this option to enable an application-level protocol that provides encryption technology for the Internet. • IPS—Select this option to scrutinize all of the bits contained within packets to look for both known and unknown attacks. • UTM—Select this option to define Layer 7 protection against client-side threats.
<i>Rule Options</i>	

Table 139: Firewall Policy Rules Setting (continued)

Setting	Guideline
Profile	Select a default profile or a custom profile, or you can inherit a policy profile from another policy. Policy profile specifies the basic settings of a security policy. See “Creating Firewall Policy Profiles” on page 400 .
Schedule	Policy schedules allow you to define when a policy is active, and thus are an implicit match criterion. You can define the day of the week and the time of the day when the policy is active. For instance, you can define a security policy that opens or closes access based on business hours. Multiple schedulers can be applied to different policies, but only one scheduler can be active per policy. Select a pre-saved schedule and the schedule options are populated with the selected schedule’s data. Click New to create another schedule.
<i>Rule Analysis</i>	
New Rule, Perform Analysis	Select this option if you want to analyze your rules to avoid any anomalies.
<i>Rule Placement</i>	
Location/Sequence	Displays the sequence number and the order in which the rule is placed.

Release History Table

Release	Description
16.2	Starting in Junos Space Security Director Release 16.2, for MX Series routers, the source zone field acts as an ingress interface from where the packet enters.
16.2	Starting in Junos Space Security Director Release 16.2, polymorphic zones can be used as source zone and destination zone, when you assign SRX Series devices and MX Series routers to the same group policy.
16.2	Starting in Junos Space Security Director Release 16.2, for MX Series routers, this field acts as an egress interface from where the packet enters.

Rule Base Overview

In Security Director, you can configure one type or both types (zone-based or global) of rule bases for each policy. All zone-based rules are grouped under Zone and all devices rules are grouped under Global.

If devices are assigned to a policy that does not have one of the rule bases under its management, Security Director still interprets that rule base as being in its scope. For example, if you configure firewall policies out of band on a device in an unmanaged rule base, Security Director deletes those policies. If you do not select the previously configured rule base in the Security Director modify workflow for the policy, Security Director automatically deletes all rules in the policy in the next publish and update.

Example: Removing a Previously Managed Rule Base

You can remove a managed device from Security Director. To remove a previously managed rule base when no other policies are published on the device except the existing policy, follow these guidelines:

- Do not select the Manage Global Policy option to modify a device policy in Security Director.

Security Director deletes the global rule base in the design data of the Security Director application.

- Publish a policy and update the device. The update deletes all global rules from the device.

On successful update, the all-devices policy for the device is removed from Security Director management.

NOTE: Security Director will continue to delete any all-devices policy configured on the device through the CLI at subsequent publish updates.

Policy Analysis

Over a period of time, firewall rule bases can become inefficient as rules become disorganized, causing some rules to become ineffective. This primarily occurs because of a lack of timely notification given to

end users when new rules, or changed rules, are added, which can adversely affect the other rules in the rule base.

This problem can be addressed by analyzing the policy and reporting the anomalies in the rules of a policy to the end user. Policy analysis reports on shadowing and redundant anomalies in a rule; these reports are available in PDF format. Also, policy analysis finds the anomaly between the address and the service of the rules.

Policy analysis helps you to analyze the firewall rule base for policies managed by Security Director, and it identifies the firewall rules that contain the following issues:

- **Shadowing**—Occurs when a rule higher in the order of the rule base matches with all the packets of a rule lower in the order of the rule base. The shadowed rule is never activated. The possible solution is to reorder the rules, or disable or delete one of the rules. The anomaly calculation is not made for disabled rules.
- **Redundant**—Occurs when there are two or more rules that perform the same action on the same packets along with the same settings or configurations. The solution is to disable or delete the redundant rules.

The policy analysis report is generated in PDF format and can be sent through e-mail to multiple recipients. The reports contain a summary and a pie chart showing all anomalies. You can schedule the report generation.

The following list shows the policy analysis behavior for different types of firewall policies:

- **All devices policy**—Analyzes all the rules present in the firewall policy landing page, within the all-devices policy.
- **Group policy**—Analyzes all the rules present in the firewall policy landing page, within the group policy including the all-devices policy rules.
- **Device policy**—Analyzes all the rules present in the firewall policy landing page, within the device policy including the all-devices policy rules. If you want to analyze all the rules present on a device, you must generate the report by clicking the device policy.
- **Device exception policy**—Analyzes all the rules present in the firewall policy landing page, within the device exception policy including all-device.

Policy analysis is not performed in the following scenarios:

- Disabled rules are not considered for the policy analysis calculation.
- Apart from the Address (source and destination) and Service columns, no other columns in the firewall landing page are considered for the policy analysis calculation.
- Variable address, wild card address, and exclude address are not considered for the policy analysis calculation.

Rule Operations on Filtered Rules Overview

You can perform various rule operations on the filtered list of rules. For example, consider a policy having seven rules such as a, b, c, d, e, f, and g in an order inside a rule group. After filtering, if only second and sixth rules are filtered, that is only rules b and f,

The following table explains the various rule operations on the filtered rules.

Rule Operation	Description
Alphabetical A-Z	Group policies are sorted alphabetically in ascending order.
Alphabetical A-Z	Group policies are sorted alphabetically in descending order.
Group Priority (High-Low)	Group policies are sorted in the order Low, Medium, and High. For the same priorities, the higher precedence number is placed in the top. For example, Low 3 has lower precedence than Low 2.
Group Priority (Low-High)	Group policies are sorted in the order Low, Medium, and High. For the same priorities, the higher precedence number is placed in the top. For example, Low 3 has lower precedence than Low 2.
Created Time	Policies are listed based on creation time. The policy created first is placed at the top.
Modified Time	Last modified policies are placed at the bottom(last).

NOTE: You cannot set the precedence value greater than the available precedence values that are assigned to the available priority policies. Based on the priority of the policies, the precedence values are applied.

Creating and Managing Policy Versions

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

You create a policy version by taking a snapshot of another policy. You can create versions for all types of policies including All Devices, Group, Device, and Device exceptions.

The maximum number of versions maintained for any policy is 60. If the maximum limit is reached, you must delete the unwanted versions before saving a new version. Versioning and rollback are independent operations for each policy.

For example, if you take a snapshot of a group firewall policy, or roll back to a previous firewall policy version, it does not change the version for all device policy rules; you must separately version each policy rule.

Creating Policy Snapshots

To create a policy version:

1. Select **Configure** and select the landing page for the type of policy for which you are creating a snapshot.
2. From the landing page, select the check box next to the policy for which you are taking a snapshot, and then right-click the policy or click **More**.

A list of actions appears.

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Click **Create Snapshot**.

The Snapshot Policy page appears.

5. Enter your comments in the Comments field, and click **Create** to take a snapshot. The Snapshot Policy window appears, showing the status of the version as it is created.

NOTE: During policy publish, Security Director takes an automatic snapshot of the policy.

Managing Policy Versions

You can view or manage all available versions of a selected policy. You can perform the following tasks on the snapshots:

- Roll back to a specific version.
- View the differences between any two versions (including the current version) of the policy
- Delete one or more versions from the system.

Rolling Back Policy Versions

To roll back the selected version so it becomes the current version:

1. Select **Configure** and select the landing page for the type of policy for which you are rolling back the policy version.
2. From the landing page, select the check box next to the policy for which you are rolling back a version, and then right-click the policy or click **More**.

A list of actions appears.

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Select the version that you want to make as the current version, and click **Rollback**.

The rollback operation replaces all the rules and rule groups of the current version with rules and rule groups from the selected version. For all the shared objects, Object Conflict Resolution (OCR) is done. If there are any conflicts between the versioned data and the current objects in the system, the OCR window is displayed.

5. After finishing any conflict resolution, click Next to view the OCR summary report.
6. Click **Finish** to replace the current policy with the versioned data. A summary of the snapshot policy is shown by clicking **Snapshot**.

Comparing Policy Versions

To compare two different versions of a policy:

1. Select **Configure** and select the landing page for the type of policy for which you are comparing versions.
2. From the landing page, select the check box next to the policy for which you want to compare versions, and then right-click the policy or click **More**.

A list of actions appears

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Select the versions to be compared, and click **Compare**. You can only compare two versions at a time.
The Compare Versions page appears.

5. Click **Compare** to view the results.

A Compare Versions results window appears showing the differences between the selected versions.

The Compare Versions results window has the following sections:

- Policy Property Changes—Shows policy changes for the modified rules.
- Rule Changes—Displays rules that are added, modified, or deleted.
- Column Changes—Shows the differences between the column content for modified rules.

Deleting Policy Versions

To delete a policy version:

1. Select **Configure** and select the landing page for the type of policy for which you are deleting a version.
2. From the landing page, right-click the policy or profile or click **More**.

A list of actions appears.

3. Click **Manage/Rollback**.

The Manage Version page appears.

4. Select the policy version you want to delete and click Delete.

A warning message is displayed.

5. Click **Yes** to confirm the deletion.

The selected policy version is deleted.

Assigning Devices to Policies

Once you create a group or device policy, you can assign devices to it.

To assign devices to a policy:

1. Select **Configure >Policy-Name Policy> Policies**.

The Policies landing page appears.

2. Right-click the policy to which you want to assign devices, or select **Assign Devices** from the More menu.

The Assign Devices page appears. The Name field shows the name of the selected policy and is not editable.

3. Select the **Show only devices without policy assigned** check box.

Only devices that are not assigned to any policy are displayed in the Device Selection section.

4. Select the devices you want to add to the policy from the Available column and click the right arrow to move these devices to the Selected **column**.

NOTE: There is an option to search for devices in the Selected column on the Assign Devices page. By default, all selected devices are sorted in a list and you can search for devices again, if required.

5. Click **OK** to assign the selected devices to the selected **policy**.

NOTE: If you do not have permission to certain devices, those devices are not visible while assigning devices to a new or existing policy.

Comparing Policies

Security Director enables you to compare two policies.

To compare any two policies:

1. Select **Configure** and select the landing page for the type of policy that you want to compare. For example, Select **Firewall Policies**.
2. From the landing page, right-click the policy or click **More**.
A list of actions appears.
3. Select **Compare Policy** to compare with other policies.
The Compare Policy page appears.
4. Select the policy to compare with, and click **OK**.
The compare result of the two policies are displayed.

Exporting Policies

Starting in Security Director Release 16.1, you can export any policies (firewall, IPS, or NAT) in a PDF or ZIP file from their respective Policies landing page.

NOTE: Policies can either be exported as PDF or ZIP file. The policies exported as ZIP file are in XML format.

To export a policy to PDF:

1. Select **Configure >Policy-Name Policy > Policies**.
The Policies landing page appears.
2. Right-click the policy you want to export or select **Export Policy to PDF** from the More menu.
The Export Policy to PDF page appears.
3. Click **Export**.
The selected policy details are exported into a PDF file.

To export policy details to a ZIP file:

1. Select **Configure >Policy-Name Policy > Policies**.
The Policies landing page appears.
2. Right-click the policy you want to export or select **Export Policy to Zip File** from the More menu.
The Export Policy page appears.
3. Click **Export**.
The selected policy details are exported into a ZIP file.

Release History Table

Release	Description
16.1	Starting in Security Director Release 16.1, you can export any policies (firewall, IPS, or NAT) in a PDF or ZIP file from their respective Policies landing page.

Creating Custom Columns

Starting Security Director Release 15.2, you can create a custom column. This is used for tracking specific notes on rules such as internal ticket numbers, changes to firewall policy rules, changes in rule ownership, and so on. The custom column is a user-defined column that is appended to the other columns on the rules page of any firewall policy. Data in these columns can be captured and saved in the same way as in the other columns.

Once you enter or modify data in a custom column, you can search the data. Security Director searches for the data and displays the results with the policy details and the rules that have the custom column data.

NOTE: To create, edit, or delete custom columns, assign the predefined or user-defined role with the appropriate custom column privileges to the users.

To create a custom column for firewall policies:

1. Select **Configure > Firewall Policy > Policies**.

The Firewall Policies page appears.

2. Right-click a policy or select **Manage Custom Columns** from the More list.

The Manage Custom Columns page appears.

3. Click the + icon to create a custom column.

The Add Custom Column page appears.

4. Enter the following details:

- a. Name—Enter a unique string of alphanumeric characters, periods, dashes, spaces, and underscores. The maximum length is 32 characters. This is a mandatory field.

- b. Validation Pattern—Enter the regular expression to validate the entered data. For example, the typical e-mail regular expression looks like this:

```
^[_A-Za-z0-9-]+(\\.[_A-Za-z0-9-]+)*@[A-Za-z0-9]+(\\.[A-Za-z0-9]+)*(\\.[A-Za-z]{2,})$.
```

This is an optional field. However, if you do not provide the regular expression, the custom column data will not be validated.

NOTE: Security Director uses the following parameters to validate custom column data:

- Explicit regular expression—The optional regular expression property is defined for the current custom column.
- Implicit length check—The maximum length of the data must be 256 characters. It is applicable to all custom columns.

5. Click **OK** to create the custom column.

The new custom column is listed in the Manage Custom Columns page.

NOTE: You can create a maximum of three custom columns.

You can view the columns that you create on the rules page of any firewall policy. Click a policy name to view the rules associated with the policy. The new custom columns appear at the end of the grid on the rules page. The custom columns are not specific to a policy and are visible on rules pages of all the firewall policies.

NOTE:

- You can edit the data in the custom column and the corresponding policy rules through an inline edit.
- Custom columns are exported when a firewall policy is exported.

Release History Table

Release	Description
15.2	Starting Security Director Release 15.2, you can create a custom column. This is used for tracking specific notes on rules such as internal ticket numbers, changes to firewall policy rules, changes in rule ownership, and so on

Importing Policies

Starting in Security Director Release 16.1, you can import policy details from a ZIP file to Security Director.

To import policy details:

1. Select **Configure >Policy-Name Policy > Policies**.
The Policies landing page appears.
2. Select **Import Policy From ZIP File** from the More menu.
The Select ZIP File page appears.
3. Click **Browse** to browse to a location where a ZIP file containing policy details is saved.
4. Select the ZIP file and click **OK**.
If there are any conflicts with the imported objects, Object Conflict Resolution(OCR) is done. The OCR window displays all the conflicts.
5. After resolving the conflicts, click **Next** to view the OCR summary report.
6. Click **Finish** to import the ZIP file.
A progress bar appears showing the status of the file upload. Once the import is successful, the policy details are shown on the Policies page.

NOTE: The import ZIP file must contain policy details of the same Security Director release. You cannot import policy details of the previous release to the current release.

Release History Table

Release	Description
16.1	Starting in Security Director Release 16.1, you can import policy details from a ZIP file to Security Director.

RELATED DOCUMENTATION

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

Unassigning Devices from Policies

Once you create a device policy, you can remove the assigned device from it. This allows you to add a preferred device at any time to a device policy. This option is not available for a group policy.

To remove an assigned device from a device policy:

1. Select **Configure > Policy-Name > Policies**.

The Policies landing page appears.

2. Select a device policy and click **More**.

3. Click **Unassign Devices**. You can also right-click a policy and select **Unassign Devices**.

The Unassign Device page appears with a confirmation message.

4. Click **Yes**.

The assigned device is removed for the selected device policy.

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared objects:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

Publishing Policies

When you publish rules, the process takes into account the priority and precedence values set on the policy and the order of rules on the device. Rules are published in the order of their priority groups, with prerules in the High priority group publishing first, before prerules in the Medium and Low priority groups.

If you change the priority or precedence of a published policy, the policy must be republished for the changes to take effect. Sometimes, changing priority or precedence in one policy can affect other policies

in the same priority group. However, such policies do not need to be republished in order for their changes in priority or precedence to take effect for the policies that are implicitly changed by the explicit changes to the republished policy.

To publish a policy:

1. Select **Configure > Policy-Name Policy > Policies**.
2. Select the policy that you want to publish and click **Publish**. The Publish Policy page appears.
3. Select the check boxes next to the devices to which the policy changes will be published.

NOTE: You can search for a specific device on which the policy is published by entering the search criteria in the search field. You can search the devices by their name and IP address.

4. Select **Schedule at a later time** if you want to schedule and publish the configuration later.
5. Select **Run now** if you want to apply the configuration immediately.
6. Click **Publish**. The Affected Devices page displays the devices on which the policies will be published.

Showing Duplicate Policies and Objects

To display duplicate objects:

1. Select the check box beside the object(s).
2. Right click and select **Show Duplicates**. Alternatively, select **Show Duplicates** from the **More** drop-down menu.

The Show Duplicates page appears.

3. Select the check box beside the duplicate object, click **Delete** and confirm to remove it.

To merge duplicate object:

Select the check box beside the duplicate object, select **Merge** from the **More** drop-down menu.

To find the usage of a duplicate object:

Select the check box beside the duplicate object, select **Find Usage** from the **More** drop-down menu.

Showing and Deleting Unused Policies and Objects

You can show or delete unused policies and objects in your network configurations.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Showing Unused Policies and Objects

You can view all unwanted policies or objects that are not used anywhere in your network to take appropriate action.

To show unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are showing.
2. From the landing page, click **More**.

A list of actions appears.

3. Select **Show Unused**.

A list of unused objects (not referenced in any policy) and unused policies appear on the page.

Deleting Unused Policies and Objects

You can clear all unwanted policies or objects that are not used anywhere in your network.

To delete unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are deleting.
2. Select the check boxes beside the items that you want to delete. Right-click on the policy or object or click More from the landing page.

A list of actions appears.

3. Select **Delete Unused**.

A confirmation window appears before you can delete the unused policies or objects.

4. Click **Yes** to confirm the deletion.

All unused policies or objects are deleted.

Updating Policies on Devices

When you finish creating and verifying your security configurations, you can publish these configurations and keep them ready to be pushed to the security devices. Security Director helps you push all the security configurations to the devices all at once by providing a single interface that is intuitive.

The Publish workflow provides the ability to save and publish different services to be updated at a later time to the appropriate firewalls (during the down time). This permits administrators to review their firewall, VPN, and NAT policies before updating the device. This saves administrators troubleshooting time, avoid errors, and saves costs associated with errors. Verify and tweak your security configurations before updating them to the device by viewing the CLI and XML version of the configuration in the Publish workflow. This approach helps you keep the configurations ready and update these configurations to the devices during the maintenance window.

When you publish rules, the process takes into account the priority and precedence values set on the policy and the order of rules on the device. Rules are published in the order of their priority groups, with prerules in the High priority group publishing first, before prerules in the Medium and Low priority groups.

If you change the priority or precedence of a published policy, the policy must be republished for the changes to take effect. Sometimes, changing priority or precedence in one policy can affect other policies in the same priority group. However, such policies do not need to be republished in order for their changes in priority or precedence to take effect for the policies that are implicitly changed by the explicit changes to the republished policy.

To update a policy:

1. Select **Configure > Policy-Name Policy > Policies**. Select the policy that you want to update and click **Update**. The Update Policy page appears.
2. Select the policy that you want to update and click **Update**. The Update Policy page appears.
3. Select the check boxes next to the devices to which the policy changes will be published.

NOTE: You can search for a specific device on which the policy is published by entering the search criteria in the search field. You can search the devices by their name and IP address.

4. Select **Schedule at a later time** if you want to schedule and publish the configuration later.
5. Select **Run now** if you want to apply the configuration immediately.
6. Click **Publish**. The Affected Devices page displays the devices on which the policies will be published.

Firewall Policy Rules Main Page Fields

Use this page to get an overall, high-level view of your firewall policy rules settings. Details help you keep track of the number and order of rules per policy. You can filter and sort this information to get a better understanding of what you want to view. [Table 141 on page 388](#) describes the fields on this page.

Table 141: Firewall Policy Rules Main Page Fields

Field	Description
Seq.	Order number for the policy. Policy lookup is performed in the order that the policies are configured. The first policy that matches the traffic is used.
Hit Count	<p>Displays how often a particular policy is used based on traffic flow. The hit count is the number of hits since the last reset.</p> <p>Example: The hit count is especially useful when you are using a large policy set and you want to verify which rules are highly utilized and which ones are rarely used. Specifically, if you see that some of the rules are not being used, you can verify that the rules are not being shadowed by another policy. This helps you manage the device without having to generate traffic manually.</p>
Rule Name	Unique name for the rule.
Src. Zone	<p>Source zone (to-zone) that defines the context for the policy. Zone policies are applied on traffic entering one security zone (source zone) to another security zone (destination zone). This combination of a source zone and a destination zone is called a context.</p> <p>For example, all policies within source zone trust and destination zone untrust are in the same context.</p>
Src. Address	<p>Address names or address set names to be used as match criteria for incoming traffic.</p> <p>We recommend that you create address sets instead of using multiple address entries. For example, If your organization has common requirements for similar types of access across different rules, leveraging groups can be advantageous.</p> <p>You can have any number of objects with a set (for example, host, network, DNS, wildcard, and so forth)</p>
Src. ID	<p>Users and roles to be used as match criteria for the policy.</p> <p>You can have different policy rules based on the user role and user group.</p> <p>If you specify the source identity in any policy within the zone pair, then user and role information is retrieved before policy lookup can proceed. (If all policies in the zone pair are set to any or have no entry in the Source Identity field, user and role information is not required and only the other five standard match criteria are used for policy lookup.)</p>
End User Profile	Specifies the end user profile, which you have selected while creating the rule.

Table 141: Firewall Policy Rules Main Page Fields (*continued*)

Field	Description
Dest. Zone	<p>Destination zone (from-zone) that defines the context for the policy.</p> <p>Zone policies are applied on traffic entering one security zone (source zone) to another security zone (destination zone). This combination of a source zone and a destination zone is called a context.</p> <p>For example, all policies within source zone trust and destination zone untrust are in the same context.</p>
Dest. Address	<p>Address names or address set names to be used as match criteria for outgoing traffic.</p> <p>We recommend that you create address sets instead of using multiple address entries.</p> <p>For example, if your organization has common requirements for similar types of access across different rules, leveraging groups can be advantageous.</p> <p>You can have any number of objects with a set (for example, host, network, DNS, wildcard, and so forth).</p>
Service	<p>The service (application) name in the match criteria has one or more service or service sets.</p> <p>We recommend that you create a service set and refer to the name of the set in a policy instead of using multiple individual service names.</p> <p>For example, for a group of employees, you can create a service set that contains all the approved services. Service objects allow you to specify objects to be used in the match criteria of security policies. You can set numerous attributes to help define what the match criteria of this object should be.</p>
Rule Condition	<p>Click the field to assign the condition.</p> <p>The Environment Condition and Action page appears. Click the + icon to select the condition. Once you add a condition, you can change the action for the selected condition. You can apply the advanced security options only if the action is Permit. You must publish and update to the device after assigning a condition to the rule.</p> <p>To select multiple conditions, click the + icon again. When multiple conditions are selected, the first active condition in the list is considered.</p>

Table 141: Firewall Policy Rules Main Page Fields (*continued*)

Field	Description
Action	<p>Action applies to all traffic that matches the specified criteria.</p> <ul style="list-style-type: none"> • Deny—Device silently drops all packets for the session and does not send any active control messages such as TCP Resets or ICMP unreachable. • Reject—Device sends a TCP Reset if the protocol is TCP and ICMP Reset if the protocols are UDP, ICMP, or any other IP protocol. This option is useful when facing trusted resources so that the applications do not waste time waiting for timeouts and instead get the active message. • Permit—Device permits traffic using the type of firewall authentication you applied to the policy. • Tunnel—Device permits traffic using the type of VPN tunneling options you applied to the policy.

Starting in Junos Space Security Director Release 16.1, the address and service objects can be created, managed, dragged and dropped to the required rules from the firewall policy rules page. Apart from addresses and services, you can also drag and drop zones. From the Shared Objects list, select **Show Addresses** or **Show Services** to see the required shared objects. To create a new address or service object, click the plus sign (+). You can also modify, delete, and manage these objects. You can search for any object by its name and IP address in the search field available in the top right corner.

You can drag more than one object and drop on the respective columns of any policy rule. Security Director ensures that objects are dropped in the supported columns and it does not permit to drop under any other columns. The drag and drop of objects is supported on the source address, destination address, source zone, destination zone, and service columns. A single address or multiple addresses can be dragged and dropped from source address field to destination address field of same rule or across rules. Similarly, single or multiple services and zones can also be dragged and dropped across rules. To view multiple objects in an address, zone, or service column, click the small horizontal triangle to expand the columns.

You can also drag and drop rules to a single rulegroup or across multiple rulegroups.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, the address and service objects can be created, managed, dragged and dropped to the required rules from the firewall policy rules page. Apart from addresses and services, you can also drag and drop zones.

Firewall Policy-Schedules

IN THIS CHAPTER

- [Schedules Overview | 394](#)
- [Creating Schedules | 395](#)
- [Schedules Main Page Fields | 396](#)

Schedules Overview

A schedule allows a policy to be active for a specified duration. If you want a policy to be active during a scheduled time, you must first create a schedule for that policy or link the policy to an existing schedule. When a schedule timeout expires, the associated policy is deactivated and all sessions associated with the policy are also timed out.

If a policy contains a reference to a schedule, that schedule determines when the policy is active. When a policy is active, it can be used as a possible match for traffic. A schedule lets you restrict access to, or remove a restriction from a resource, for a period of time.

A schedule uses the following guidelines:

- A schedule can have multiple policies associated with it; however, a policy cannot be associated with multiple schedules.
- A policy remains active as long as the schedule it refers to is also active.

A schedule can be active during a single time slot, as specified by a start date and time, and a stop date and time.

- A schedule can be active forever (recurrent), but only as specified by the daily schedule. The schedule on a specific day (time slot) takes priority over the daily schedule.
- A scheduler can be active during a time slot, as specified by the weekday schedule.
- A scheduler be active within two different time slots (daily or for a specified duration).

RELATED DOCUMENTATION

Firewall Policies Overview	353
Firewall Policies Best Practices	360

Creating Schedules

Use schedules to activate a policy at a regular time and for a specified duration. You can define a schedule for a single or recurrent time slot during which a policy is active.

Before You Begin

- Read the Schedules Overview topic.
- Review the schedules main page for an understanding of your current data set. See [“Schedules Main Page Fields” on page 396](#) for field descriptions.

Configuring Schedules Settings

To create policy schedules:

1. Select **Configure > Firewall Policy > Schedules**.
2. Click **Create**.
3. Complete the configuration according to the guidelines provided in Table 1.
4. Click **OK**.

A new schedule is created. You can use this schedule to activate firewall policies for the times and dates configured in your schedules.

Table 143: Schedules Settings

Settings	Guidelines
<i>General</i>	
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the; maximum length is 63 characters.
Description	Enter a string of alphanumeric characters that cannot contain special characters (such as &, <, >, and \n). Maximum length is 900 characters.

Table 143: Schedules Settings (*continued*)

Settings	Guidelines
<i>Dates</i>	
Date Range	<p>Select Forever if you want your schedules to always be active.</p> <p>Select Specify to configure two sets of start and end dates for a single schedule. For the first set, enter dates in the Start Date and End Date fields. You must enter the days in MM/DD/YYYY format.</p> <p>For the second set of the schedule, enter the start date in the Second Start Date field and enter the end date in the Second End Date field.</p>
<i>Times</i>	
Time Ranges	Create a schedule to be active daily or for any specific times of the day.
Daily Options	<p>Select Specify to enter specific days and times. Click on a specific day to specify time options for an entire day, to exclude a specific day, or to enter time ranges for the selected day. You must enter the time in HH:MM:SS format.</p> <p>For example, if you click on Monday, you get a dialog box that allows you to specify whether you want the schedule to be active all day Monday, exclude Monday from the schedule, or have the schedule be active at specific times.</p>

Firewall Policy-Profiles

IN THIS CHAPTER

- Understanding Firewall Policy Profiles | 398
- Understanding Captive Portal Support for Unauthenticated Browser Users | 399
- Creating Firewall Policy Profiles | 400
- Editing and Cloning Policies and Objects | 406
- Deleting and Replacing Policies and Objects | 407
- Assigning Policies and Profiles to Domains | 408
- Viewing Policy and Shared Object Details | 409
- Firewall Policy Profiles Main Page Fields | 409

Understanding Firewall Policy Profiles

When a firewall policy profile is created, Security Director creates an object in the Security Director database that represents the firewall policy profile. You can use this object in the security policies.

The following are the Juniper Networks predefined firewall policy profiles:

- All Logging Enabled—All logging options are enabled. Logging is enabled at session initiation and at the close of the session.
- All Logging Disabled—All logging options are disabled.
- Log Session Close—Logging of events is enabled when sessions are closed.
- Log Session Init—Logging of events is enabled when sessions are created.

NOTE: You cannot modify or delete Juniper Networks predefined firewall policy profiles. You can only clone them and create new firewall policy profiles.

You can create an object, which defines the user defined policy profiles for the following settings:

- Log options:

- Log at session initiation
- Log at the close of a session
- Enable counting for the number of packets, bytes, and sessions that enter the firewall for a given policy
- Alarm threshold options
- Firewall authentication advance settings:
 - Service offload
 - Pass-through authentication
 - Web authentication
 - User firewall authentication
 - Infranet authentication
- Traffic redirection options:
 - No traffic redirection
 - Redirect WX—WX redirection for packets that arrive from the LAN
 - Reverse Redirect WX—WX redirection for the reverse flow of packets that arrive from the WAN
 - TCP-SYN Check and TCP Sequence Check—TCP session options for firewall policy profile

Understanding Captive Portal Support for Unauthenticated Browser Users

When an unauthenticated user requests access to an SRX Series protected resource using an HTTP or HTTPS browser, the SRX Series device presents the user with a captive portal interface to allow the user to authenticate. Normally, this process occurs without interference. However, prior to introduction of this feature, HTTP or HTTPS-based workstation services running in the background, such as Microsoft updates and control checks, could trigger captive portal authentication before the HTTP or HTTPS browser-based user's access request did. The situation posed a race condition. If a background process triggered captive

portal first, the SRX Series device presented it with a “401 Unauthorized” page. The service discarded the page without informing the browser, and the browser user was never presented with the authentication portal. The SRX Series device did not support simultaneous authentication from the same source IP address on different SPUs.

The SRX Series device now supports simultaneous HTTP or HTTPS pass through authentication across multiple SPUs, including support for web-redirect authentication. If an HTTP or HTTPS packet arrives while the SPU is querying the Captive Portal (CP), the SRX Series device queues the packet to be handled later.

Starting in Junos Space Security Director Release 17.1, Security Director supports Auth Only Browser and Auth User Agent parameters to give you high control over how HTTP or HTTPS traffic is handled.

- **Auth Only Browser**—Authenticate only browser traffic. If you specify this parameter, the SRX Series device distinguishes HTTP or HTTPS browser traffic from other HTTP or HTTPS traffic. The SRX Series device does not respond to non-browser traffic. You can use the `auth-user-agent` parameter in conjunction with this control to further ensure that the HTTP traffic is from a browser.
- **Auth User Agent**—Authenticate HTTP or HTTPS traffic based on the User-Agent field in the HTTP or HTTPS browser header. You can specify one user-agent value per configuration. The SRX Series device checks the user-agent value that you specify against the User-Agent field in the HTTP or HTTPS browser header for a match to determine if the traffic is HTTP or HTTPS browser-based. You can use this parameter with the Auth Only Browser parameter or individually for both Pass Through and User Firewall authentication types.

RELATED DOCUMENTATION

[Understanding Firewall Policy Profiles | 398](#)

[Creating Firewall Policy Profiles | 400](#)

Creating Firewall Policy Profiles

Use this page to create an object that specifies the basic settings of a security policy. You can configure the following basic settings using a policy profile:

- Log options
- Firewall authentication schemes
- Traffic redirection options

When a policy profile is created, Junos Space creates an object in the Junos Space database to represent the policy profile. You can use this object to create security policies.

The security policies enforce rules for transit traffic, in terms of what traffic can pass through the firewall, and the actions that need to take place on traffic as it passes through the firewall. Also, you can control the traffic flow from zone to zone by defining the kinds of traffic permitted to pass from specified sources to specified destinations at scheduled times.

Before You Begin

- Read the [“Understanding Firewall Policy Profiles” on page 398](#) topic.
- Create zones.
- Create an application (or application set) that indicates that the policy applies to traffic of that type.
- Create the policy.
- Create schedulers if you plan to use them for your policies.
- Review the policy profiles main page for an understanding of your current data set. See [“Firewall Policy Profiles Main Page Fields” on page 409](#) for field descriptions.

Configuring Policy Profiles Settings

To configure a policy profile:

1. Select **Configure > Firewall Policy > Profiles**.
2. Click the + icon.
3. Complete the configuration according to the guidelines provided in the [Table 145 on page 401](#).
4. Click **OK**.

A new policy profile with the predefined policy configurations is created. You can use this object in security policies.

Table 145: Firewall Policy Profile Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Description	Enter a description for the policy profile; maximum length is 1024 characters.
Template	Select a Security Director device template to use the predefined device-deployable configuration by replacing the variables with actual values and evaluating the control logic statements.

Table 145: Firewall Policy Profile Settings (*continued*)

Settings	Guidelines
Logging	
Session Initiate	Select this option to enable logging of events when sessions are created.
Session Close	Select this option to enable logging of events when sessions are closed. When logging is enabled, the system logs at session close time by default.
Count	Select this option to enable counting. Once enabled, the number of packets, bytes, and sessions that enter the device for a given policy are counted. You can configure counts in an individual policy.
Alarm Threshold	
Bytes to be Logged	Enter the alarm threshold, in bytes per second, of all network traffic the policy allows to pass through the device in both directions from client to server and server to client. The range is from 0 through 4,294,967,295.
Count Value	Enter the alarm threshold, in kilobytes per minute, of all network traffic the policy allows to pass through the device in both directions from client to server and server to client. The range is from 0 through 4,294,967,295.
Authentication	
Authentication Type	Select an option to restrict or permit users individually or in groups: <ul style="list-style-type: none"> • None—Allows user without any authentication to restrict or permit clients. • Pass Through—Allows user to use an FTP, Telnet, or HTTP client to access the IP address of the protected resource in another zone. Subsequent traffic from the user or host is allowed or denied based on the result of this authentication. • Web—Policy allows access to users who have previously been authenticated by Web authentication. • User Firewall—Uses the username and role information to determine whether to permit or deny a user's session or traffic. • Infranet—Pushes the user and role information for all authenticated users from the Access Control Service.
Authentication Type - Pass Through	

Table 145: Firewall Policy Profile Settings (continued)

Settings	Guidelines
Client Name	Enter the names of the users or user groups in a profile for whom this policy allows access. If you do not specify any users or user groups, then any user who is successfully authenticated is allowed access.
Client Direction	<p>Enable an option to redirect HTTP request:</p> <ul style="list-style-type: none"> • Redirect to web—Redirects an HTTP request to the device and redirect the client system to a webpage for authentication. This allows users an easier authentication process because they need to know only the name or IP address of the resource they are trying to access. • Redirect to HTTPS—Redirects unauthenticated HTTP requests to the internal HTTPS webserver of the device.
Access Profile Name	Enter a name for the access profile to be used for authentication.
Auth Only Browser	<p>Enable this option to configure the firewall authentication to ignore non browser HTTP/HTTPS traffic.</p> <p>This ensures that the unauthenticated users issuing access requests through HTTP/HTTPS browsers are presented with a captive portal interface to allow them to authenticate. By default, firewall authentication responds to all HTTP/HTTPS traffic.</p>
Auth User Agent	<p>Specify a user agent value to be matched against values specified in the browser's User-Agent header field that identifies the traffic as HTTP/HTTPS browser traffic. You can specify only one user agent value for a security policy configuration. The value must not contain spaces. The length of the string must be 17 characters or less. For example, you can specify Opera to be verified against the browser's User-Agent field for a match.</p> <p>You can either use this parameter for the Pass Through or User Firewall authentication types or in conjunction with the Auth Only Browser parameter.</p>
Authentication Type - Web	
Client Name	Enter the names of the users or user groups who have already been Web authenticated and for whom this policy allows access. Web authentication must be enabled on one of the addresses on the interface to which the HTTP request is redirected.
Authentication Type - User Firewall	
Domain Name	<p>Enter a domain name for firewall authentication in the event that the Windows Management Instrumentation client (WMIC) is not available to get IP-to-user mapping for the integrated user firewall feature.</p> <p>The maximum length is 63 characters.</p>

Table 145: Firewall Policy Profile Settings (*continued*)

Settings	Guidelines
Access Profile Name	Enter a name for the access profile to be used for authentication.
Auth Only Browser	<p>Enable this option to configure the firewall authentication to ignore non browser HTTP/HTTPS traffic.</p> <p>This ensures that the unauthenticated users issuing access requests through HTTP/HTTPS browsers are presented with a captive portal interface to allow them to authenticate. By default, firewall authentication responds to all HTTP/HTTPS traffic.</p>
Auth User Agent	<p>Specify a user agent value to be matched against values specified in the browser's User-Agent header field that identifies the traffic as HTTP/HTTPS browser traffic. You can specify only one user agent value for a security policy configuration. The value must not contain spaces. The length of the string must be 17 characters or less. For example, you can specify Opera to be verified against the browser's User-Agent field for a match.</p> <p>You can either use this parameter for the Pass Through or User Firewall authentication types or in conjunction with the Auth Only Browser parameter.</p>
Authentication Type - User Infranet	
Redirect URL	Enter a URL for the webpage to which the client is directed. For example: https://www.juniper.net/ .
Redirect Options	<p>Select an option to redirect encrypted or unencrypted traffic:</p> <ul style="list-style-type: none"> • None—To not redirect any traffic • All Traffic—To redirect the encrypted traffic • Unauthenticated Traffic—To redirect the unencrypted traffic
Advance Settings	
Datacenter SRX Acceleration	Enable this option to process fast-path packets in the network processor instead of in the Services Processing Unit (SPU). When performing the policy check, the SPU verifies if the traffic is qualified for services offloading.

Table 145: Firewall Policy Profile Settings (*continued*)

Settings	Guidelines
Destination Address Translation	<p>Select an option to specify whether the traffic permitted by the policy is limited to packets where the destination IP address has been translated by means of a destination NAT rule or to packets where the destination IP address has not been translated:</p> <ul style="list-style-type: none"> • Drop Untranslated—You do not want to translate the destination address. Traffic permitted by the policy is limited to packets where the destination IP address has not been translated. • Drop Translated—You want to translate the destination address. Traffic permitted by the policy is limited to packets where the destination IP address has been translated by means of a destination NAT rule.
Redirect Options	<p>Select an option to define the acceleration policy for WX redirection of packets to the WXC Integrated Service Module (ISM 200) for WAN acceleration:</p> <ul style="list-style-type: none"> • None—You want traffic to be redirected • Redirect WX—You want to enable Wx redirection for packets that arrive from the LAN • Reverse Redirect WX—You want to enable WX redirection for the reverse flow of packets that arrive from the WAN. <p>During the redirection process, the direction of the WX packet and its type determine further processing of the packet.</p>
TCP-Session Options	
TCP-SYN	Enable this option for the device to reject TCP segments with non-SYN flags set unless they belong to an established session.
TCP Sequence	Enable this option to monitor the TCP byte sequence counter and to validate the trusted acknowledgment number against the untrusted sequence number.

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared objects:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Note: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

RELATED DOCUMENTATION

[Creating Firewall Policies | 358](#)

[Creating IPS Policies | 507](#)

Assigning Policies and Profiles to Domains

You can assign or reassign policies or profiles to different domains when it is first configured and whenever you want to implement a change. You can assign only one policy or profile at a time. Before assigning a policy or profile to another domain, Security Director checks for the validity of the move. If the move is not acceptable, a warning message appears.

To assign a policy or profile to a domain:

1. Select **Configure** and select the landing page for the type of policy or profile that you are assigning to a domain.
2. From the landing page, right-click the policy or profile or click **More**.
A list of actions appears.

3. Select **Assign <Policy or Profile> to Domain**.

The Assign <Policy or Profile> to Domain page appears.

NOTE: <Policy or Profile> is the name of the policy or profile that you are assigning to a domain.

4. Select the required items to assign to a domain.
5. Enable this option to ignore warning messages, if any.
6. Click **Assign**.
A policy or profile is assigned to a domain.

Viewing Policy and Shared Object Details

On a policy or a shared object landing page, you can get a detailed view of the existing policies or objects. The Detail View page lists all the configured parameters of a policy or an object. The Landing page of a policy or shared object lists only some of the configured parameters and not all. The Detail View option helps you to get a consolidated view of all the configured parameters.

NOTE: The detailed view is in read-only mode; you cannot edit any fields.

To see a detailed view of the policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to see the detailed view for, or select **Detail View** from the More list.

The Detail View page appears showing the configuration information, the user who created that particular policy or shared object, and the last updated information.

You can also get a detailed view by hovering over the name and clicking the Detailed View icon before the policy or shared object name.

- [Deleting and Replacing Policies and Objects | 414](#)
- [Firewall Policy Templates Main Page Fields | 415](#)

Understanding Firewall Policy Templates

With the firewall policy template feature, you can use a CLI-based template editor to send configuration details to multiple devices. Because it is Device Management Interface (DMI) schema-driven, this template is used to generate a device deployable configuration by replacing the parameterized elements (variables) with actual values and evaluating the control logic statements.

When you do not have an object in Security Director for a firewall policy, you can create template with the Junos CLI. After you create a template, you can add it in firewall policy and then refer it in rules. When you deploy the firewall policy, all the assigned devices are also deployed. This template is based on the Junos Space CLI quick templates.

Creating Firewall Policy Templates

Use this page to manage and create policy templates. You can use a CLI-based template editor to send configuration details to multiple devices. The template editor is a text-editing area, where you can type or paste Junos OS CLI commands.

Before You Begin

- Read the [“Understanding Firewall Policy Templates” on page 411](#) topic.
- Have a basic understanding of Junos OS CLI commands.
- Review the Firewall Policy Templates main page for an understanding of your current data set. See [“Firewall Policy Templates Main Page Fields” on page 415](#) for field descriptions.
- Create source (from-zone) and destination (to-zone) zones.

Configuring Firewall Policy Templates Settings

To configure a firewall policy template:

1. Select **Configure > Firewall Policy > Templates**.
2. Click the + icon.
3. Complete the configuration according to the guidelines provided in [Table 147 on page 412](#).
4. Click **OK**.

A new firewall policy device template with your configurations is created. Create a policy profile and associate the template in the policy profile. After associating the template, the policy profile can be referred in the firewall rules or firewall policies.

Table 147: Firewall Policy Template Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Description	Enter a description for the firewall policy device template; maximum length is 1024 characters.
Device Family	Displays the autopopulated Juniper Networks SRX Series or LN Series devices as the device family. For example, SRX/vSRX/LN.

Table 147: Firewall Policy Template Settings (continued)

Settings	Guidelines
Release Number	Select a Junos schema release running on the device. For example, 11.4R2.4.
Template Editor	Enter or copy the Junos OS CLI commands to send configuration details to multiple devices.
Validate	Click the link to validate the configuration on the device. This ensures that the device template is semantically correct.

Environment

IN THIS CHAPTER

- [Environment Variables and Conditions Overview | 417](#)
- [About the Environment Page | 419](#)
- [Creating a New Environment Variable | 421](#)
- [Editing and Deleting Environment Variables | 422](#)
- [Creating a New Environment Condition | 424](#)
- [Editing and Deleting Environment Conditions | 425](#)

Environment Variables and Conditions Overview

You can use environment variables and conditions to configure dynamic policy actions for your firewall policy rules. With traditional firewall rules, if you want to block all outbound traffic, then you must manually modify the action of the rules from permit to deny. Similarly, if you want to allow all traffic, you modify the action from deny to permit. When handling critical events, going through hundreds of firewall policy rules and modifying them is both time consuming and inefficient. Further, when the event is over, you might need to revert those rule settings to the previously configured values.

To avoid such manual configurations to the firewall rules and to improve your control over configurations, as a network administrator, you can define environment variables and apply conditions by using these variables. Based on the conditions that you define, certain preconfigured actions are taken on the firewall policy rules dynamically.

Along with the action, you can define certain advanced security properties. You can also disable the rules based on the action and change the logging options.

[Table 149 on page 417](#) and [Table 150 on page 418](#) show examples of the usage of custom-defined environment variables and rule actions based on variable values.

Table 149: Example of Custom-Defined Environment Variables

Environment Variable	Type	Possible Value	Default Value	Current Value
Threat Level	String	Low, Medium, High	Low	High

Table 150: Example of Rule Actions Based on Variable Values

Rule #	Source	Destination	Service	Firewall	IPS
m	Employee	Internet video	http	If (ThreatLevel= High) Deny Else Permit	None
n	WebZone	DBZone	DB	Permit	If (ThreatLevel=High) Adv_profile Else Std_Profile

Table 151 on page 418 shows an example of how conditions are used. In the Environment Condition column, the condition is first evaluated to identify the related set of action the system will take. For example, if the value of the ThreatLevel environment variable is Medium at any point of time, the system automatically enables the intrusion prevention system (IPS) service for the corresponding traffic.

Table 151: Example of Environment Condition

Rule Number	Source Traffic Match Criteria	Destination Traffic Match Criteria	Environment Condition	Firewall Action	Other Actions
1000	Any	MyCriticalServers	ThreatLevel=Low	PERMIT	LOG
			ThreatLevel=Medium	PERMIT	LOG IPS_STD_PROFILE
			ThreatLevel=High	DENY	LOG

Benefits of Environment Variables and Conditions

- Simplifies the task of creating, in advance, different security actions that the security team can take to test the system's behavior under different environmental conditions.
- Reduces the time required to react to security threats or situations and take the required actions. During critical situations, security administrators must focus on identifying the attacks and, with environment variables configured, they do not have to spend too much time and effort in manipulating the rules table.
- Reduces the probability of manual errors, especially during critical events when a large number of firewall policy rules need to be edited.
- Helps reduce business risks by streamlining security operations for normal conditions as well as for other dynamic conditions.

About the Environment Page

To access this page, click **Configure > Environment**.

Use the Environment page to configure and manage the environment variables and its conditions to dynamically change firewall rule actions.

Every time the environment changes, you do not have to go through the entire rule configuration. Instead, rules are modified dynamically when the environment changes; you are required to only update the value of the variables.

Typically, network administrators configure environment variables and conditions.

Tasks You Can Perform

You can perform the following tasks from the Environment page:

- Create a new environment variable from the Variables tab. See [“Creating a New Environment Variable” on page 421](#).
- Edit or delete the environment variable from the Variables tab. See [“Editing and Deleting Environment Variables” on page 422](#).

You can perform the following tasks from the Environment page:

- Create a new environment condition from the Environment Conditions tab. See [“Creating a New Environment Condition” on page 424](#).
- Edit or delete the environment condition from the Environment Conditions tab. See [“Editing and Deleting Environment Conditions” on page 425](#).

Field Descriptions

[Table 152 on page 420](#) provides guidelines on using the fields on the Environment Variables page.

Table 152: Fields on the Environment Page

Field	Description
Variables tab	
Variable	Specifies the name of the environment variable.
Possible Values	Specifies the user-defined values for each variable to secure the network situation.
Current Value	Specifies the current value of the variable.
Used In	<p>Specifies the environment conditions where the variable is used and the number of rules assigned to that condition.</p> <p>Click the number of conditions or rules for more information.</p>
Last Changed On	Specifies the last modified date and time of the variable.
Environment Conditions tab	
Condition Name	<p>Specifies the name of the condition.</p> <p>The green dot before the condition name means that the condition is active.</p>
Variables Used	Specifies the environment variables used in that particular condition.
Current State	Specifies the current state of the condition. For example, active or inactive.
Used In	Specifies the number of rules that matches the condition.
Activated Count	Shows the number of times the condition was active.
Status Changed On	Specifies the date and time of the state change from active to inactive and vice versa.

Creating a New Environment Variable

Use the Create a New Environment Variable page to define the new environment variables and assign the threat levels. These variables are used to define the environment conditions.

To create a new environment variable:

1. Select **Configure > Environment**.

The Environment page appears.

2. Select the **Variables** tab and click the + icon.

The Create New Environment Variable page appears.

3. Complete the configuration by using the guidelines in [Table 153 on page 421](#).

4. Click **Save** to save the configuration or **Cancel** to discard the configuration.

Use these environment variables to define the environment conditions. You can create a new condition or edit the existing condition to use these variables.

Table 153: Fields on the Create New Environment Variable Page

Field	Description
Variable Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed; maximum length is 63 characters.
Possible Value Type	<p>Select the type of possible values.</p> <ul style="list-style-type: none"> • Numbers—Select this option to provide a list of numbers. • Number Range—Select this option to define a number range for the possible values. • Text—Select this option to provide the string as a possible value.
Possible Values	Enter the list of possible values, based on the possible value type that you have selected. For example, high, medium, low, 2, 4, or 1 to 6.
Default Value	Select the default possible value for the environment variable from the list.
Current Value (optional)	Select the current possible value for the environment variable from the list. If nothing is defined, the default value is considered the current value.

RELATED DOCUMENTATION

[Environment Variables and Conditions Overview | 417](#)

Editing and Deleting Environment Variables

IN THIS SECTION

- [Editing Environment Variables | 422](#)
- [Deleting an Environment Variable | 423](#)

You can edit or delete the environment variables from the Variables tab.

Editing Environment Variables

To edit an environment variable:

1. Select **Configure > Environment**.

The Environment page appears.

2. Select the variable that you want to edit, and then click the pencil icon.

The Edit Environment Variable page appears showing the same options that were used to create a new variable.

3. Changing the variable values might impact the actions of certain rules. To view the affected rules, click **click here** in the Change Impact section.

The Policy Change List page appears listing the affected firewall policies with rules. Click the rules to preview the changes.

4. Click **Save** to save your changes.

The Policy Change List page appears listing the rules that are modified because of the variable update.

- 5. Click **Publish** and **Update** to update the modified rules to the device.

Deleting an Environment Variable

You can only delete variables that are not used in any condition. If you try to delete a variable in use, you will receive a failure message with a link to view the list of conditions that have used the selected variable.

To delete a variable that is not used in any condition:

- 1. Select **Configure > Environment**.

The Environment page appears.

- 2. Select the variable that you want to delete, and then select the delete icon (X).

An alert message appears confirming the delete operation.

- 3. Click **Yes** to delete your selection.

If the variable is not used in any condition, then the delete operation is successful. Otherwise you see a failure message.

RELATED DOCUMENTATION

Environment Variables and Conditions Overview 417
About the Environment Page 419
Creating a New Environment Variable 421
Creating a New Environment Condition 424
Editing and Deleting Environment Conditions 425
Firewall Policy Rules Main Page Fields 387

Creating a New Environment Condition

Use the Create New Environment Condition page to create a new environment condition using the environment variables.

To create a new environment condition:

1. Select **Configure > Environment**.

The Environment page appears.

2. Select the **Environment Conditions** tab and click the + icon.

The Create New Environment Condition page appears.

3. Complete the configuration by using the guidelines in [Table 154 on page 424](#).

4. Click **Save** to save the configuration or **Cancel** to discard the configuration.

After defining a new condition, you must apply it to the firewall policy rules. After assigning these conditions to the rules, publish and update to the device.

Table 154: Fields on the Create New Environment Condition Page

Field	Description
Condition Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed; maximum length is 63 characters.
Description	Enter a description for the environment condition; maximum length is 255 characters.
Condition	Click the field and select the environment variable and the required possible values. You can choose one or more variables in a combination. For example, use '=' or '!=' operator to apply OR condition for the possible values. You can choose the AND operator, for the AND condition.

Security administrators can now use the conditional evaluators based on the environment variables in the firewall policy. Security Director auto-calculates the changes to the relevant rules and based on the administrator's approval, pushes out these changes to the entire network as required.

For example, the firewall policy rule table is updated with environment conditions, as shown in [Table 155 on page 425](#). If the ThreatLevel is Orange at a point of time, the system enables IPS service automatically for the corresponding traffic.

Table 155: Firewall Rule with a Condition

Rule Number	Source Traffic Match Criteria	Destination Traffic Match Criteria	Environmental Condition	Firewall Action(s)	Other Actions
1000	Any	MyCriticalServers	ThreatLevel=GREEN	PERMIT	LOG
			ThreatLevel=ORANGE	PERMIT	LOG IPS_STD_PROFILE
			ThreatLevel=RED	DENY	LOG

Understanding Application Firewall Policies

Many dynamic applications use HTTP static ports to tunnel non-HTTP traffic through the network. Such applications can permit traffic that might not be adequately controlled by standard network firewall policies, leading to a security threat. Standard policies function based on IP addresses and ports, and therefore are not effective with these dynamic applications. To avoid these security issues, an additional security control for policies was introduced that functions based on the application ID.

The security policies provide firewall security functionality by enforcing rules for the traffic, which pass through the device, is permitted or denied based on the action defined in the rules. The application firewall port in the policies provides additional security control for dynamic applications.

An application firewall provides the following features:

- Permits, rejects, or denies traffic based on the application in use.
- Identifies not only HTTP but also any application running on top of it, letting you properly enforce policies. For example, an application firewall rule could block HTTP traffic from Facebook but allow Web access to HTTP traffic from MS Outlook.

The application firewall policy is defined by a collection of rule sets. A rule set defines the rules that match the application ID detected, based on the application signature. After you create an application firewall policy by adding rules, you can select that policy to be the active policy on your device.

The application firewall policy identifies the application ID as an unknown application ID under the following circumstances:

- No application ID matches the traffic.
- The system encounters an error when identifying the application.
- Application ID is not identified during failover sessions.

When the application ID is identified as unknown, the traffic is processed based on the action defined in the unknown rule in the rule set. When there is no rule defined for unknown in the rule set, the default rule is applied for unknown dynamic applications.

RELATED DOCUMENTATION

[Showing and Deleting Unused Policies and Objects | 433](#)

Creating Application Firewall Policies

Use the Application Firewall Policies page to configure an application firewall policy and to specify the rule set to be applied to it.

An application firewall:

- Permits, rejects, or denies traffic based on the application of the traffic.
- Consists of one or more rule sets that specify match criteria and the action to be taken for matching traffic.
- Identifies not only HTTP but also any application running on top of it, letting you properly enforce policies. For example, an application firewall rule could block HTTP traffic from Facebook but allow Web access to HTTP traffic from MS Outlook.

Before You Begin

- Read the [“Understanding Application Firewall Policies” on page 427](#) topic.
- Have a basic understanding of firewall rules.

- Have a basic understanding of an application (or application set) that indicates that the policy applies to traffic that matches it.
- Review the application firewall policies main page for an understanding of your current data set. See [“Application Firewall Policies Main Page Fields” on page 435](#) for field descriptions.

Configuring Application Firewall Policies Settings

To configure an application firewall policy, you must create a policy and then add rules to it. To create an application firewall policy:

1. Select **Configure > Application Firewall Policy > Policies**.
2. Click the + icon.
3. Complete the configuration according to the guidelines provided in the [Table 156 on page 429](#).
4. Click **OK**.

To add rules to the application firewall policy:

1. Click **Add Rules** for the policy you created.
2. Click +.
3. Complete the configuration according to the guidelines provided in the [Table 157 on page 430](#).
4. Click **OK**.

A new application firewall policy with your configurations is created. You can add rules to this policy to provide additional security.

Table 156: Application Firewall Policies Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Description	Enter a description for the policy; maximum length is 1024 characters.

Table 157: Add Rule Settings

Settings	Guidelines
Rule Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Application Signatures	<p>Select an option to add or delete an application signature.</p> <p>Select one or more available application signatures to add to the rules.</p>
Encryption	<p>Select an option to specify different actions for encrypted and unencrypted SSL traffic:</p> <ul style="list-style-type: none"> Any—Matches both encrypted and unencrypted SSL traffic. Yes—Matches encrypted SSL traffic only. No—Matches unencrypted SSL traffic only.
Action	<p>Select an option for any traffic that matches the application firewall rule set:</p> <ul style="list-style-type: none"> Permit—Allows the traffic at the firewall. Deny—Blocks traffic, closes the session, and logs the event from an application firewall. By default, no message is returned to the client. But you can choose to send a message. Reject—Drops traffic with a message to the client, closes the session, and logs the event from an application firewall.
Notify user on blocking (Deny or Reject)	<p>Select whether or not to notify clients when drop or reject actions are logged from an application firewall:</p> <ul style="list-style-type: none"> Yes—Displays a default message or customized message, or redirects the clients for denied HTTP or HTTPS traffic. All other traffic is dropped silently. No—No message is sent to the client.
Default Action—Default Action for other applications (not matching any rule)	<p>Select an option for any traffic that does not match any defined application firewall rule:</p> <ul style="list-style-type: none"> Permit—Allows the traffic at the firewall. Deny—Blocks the traffic and the device drops the packet. By default, no message is returned to the client but you can choose to send a message. Reject—Drops the traffic. By default the device drops the packet and returns a TCP reset (RST) message to the source host and to the server in some cases. For UDP or other protocol traffic, an ICMP unreachable message is returned to both client and server.

Table 157: Add Rule Settings (*continued*)

Settings	Guidelines
Block Message—Block Message Type	<p>Select an option to provide a text explanation to the client, redirect the client to an informative webpage, or do nothing after a reject or deny action from an application firewall:</p> <ul style="list-style-type: none"> • Not Configured—No message is returned to the client. • Custom Message—Enter text to display with splash screen to inform the client that the traffic has been blocked. • Redirect URL—Enter URL to redirect the client to a custom webpage instead of the default splash screen. For example: https://www.juniper.net/.

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

[Creating NAT Policies | 567](#)

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared objects:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

Showing and Deleting Unused Policies and Objects

You can show or delete unused policies and objects in your network configurations.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Showing Unused Policies and Objects

You can view all unwanted policies or objects that are not used anywhere in your network to take appropriate action.

To show unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are showing.
2. From the landing page, click **More**.
A list of actions appears.
3. Select **Show Unused**.
A list of unused objects (not referenced in any policy) and unused policies appear on the page.

Deleting Unused Policies and Objects

You can clear all unwanted policies or objects that are not used anywhere in your network.

To delete unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are deleting.
2. Select the check boxes beside the items that you want to delete. Right-click on the policy or object or click **More** from the landing page.
A list of actions appears.
3. Select **Delete Unused**.
A confirmation window appears before you can delete the unused policies or objects.
4. Click **Yes** to confirm the deletion.
All unused policies or objects are deleted.

Finding Usages for Policies and Objects

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

You can find usages for policies or objects and take appropriate action.

To find policies or objects usages:

1. Select **Configure** > and select the landing page for the policy or object for which you want to find usages.

The policies or shared objects page appears

2. Right-click the policy or object or click **More**.
3. Select Find Usage. The usage window appears, showing the usage of the selected policy or object.

Application Firewall Policies Main Page Fields

Use the application firewall policies main page to get an overall, high-level view of your application firewall policy settings. You can filter and sort this information to get a better understanding of what you want to configure. [Table 158 on page 435](#) describes the fields on this page.

Table 158: Application Firewall Policies Main Page Fields

Field	Description
Name	Name of the application firewall policy; maximum length is 63 characters.
Default Action	Action taken for any traffic that matches one of the specified applications. For example: Reject, Permit, Deny.

Table 158: Application Firewall Policies Main Page Fields (*continued*)

Field	Description
Rules	The match criteria, including dynamic applications, and the action to be taken for matching traffic.
Block Message Type	The type and content in a block message profile defined in the rule set. For example: Text, URL.
Block Message/Redirect URL	Either a text explanation to the client or a URL redirect of the client to an informative webpage. Occurs when traffic is blocked by a reject action or a deny action from an application firewall.
Domain	Domain name of the security device. This information is autopopulated once you select the device. For example: global, system.
Description	Description of the application firewall policy.

- [ICMP-Based Mapping | 438](#)
- [Address-Based Mapping | 438](#)
- [IP Protocol-Based Mapping | 439](#)
- [Layer 7-Based Signatures | 439](#)

Application identification supports user-defined custom application signatures and signature groups. Custom application signatures are unique to your environment and are not part of the predefined application package when you install them into the device. The custom application signatures are pushed to the device when you publish or update and subsequently, you can use them in the application firewall policy rules only.

The custom application signatures are required:

- To control traffic particular to an environment
- To bring visibility for unknown or unclassified applications by developing custom applications

- To identify applications over Layer 7 that are transiting or temporary applications, and to achieve further granularity of known applications
- To perform QoS for your specific application

Starting in Junos Space Security Director 17.1, you can create the custom application identification for all devices running Junos OS Release 15.1X49-D40 and later. You can use the custom application identification in the application firewall policies similar to the predefined application identifications. If the custom application identifications are not supported by a device, Security Director shows an error during the policy publish or the configuration preview.

You can import the custom application signatures from a device and also push the created custom application signatures to a device, by using the publish and update workflow.

NOTE:

- You can use the custom application signatures only in the application firewall policy rules.
- Security Director and device configurations must be in sync for the application visibility to work with the custom application signatures.

SRX Series devices support the following types of custom signatures:

ICMP-Based Mapping

The ICMP mapping technique maps standard ICMP message types and optional codes to a unique application name. This mapping technique lets you differentiate between various types of ICMP messages.

Address-Based Mapping

Layer 3 and Layer 4 address mapping defines an application by the IP address and optional port range of the traffic.

To ensure adequate security, use address mapping when the configuration of your private network predicts application traffic to or from trusted servers. Address mapping provides efficiency and accuracy in handling traffic from a known application.

With Layer 3 and Layer 4 address-based custom applications, you can match the IP address and port range to destination IP address and port. When IP address and port are configured, they must match the destination tuples (IP address and port range) of the packet.

For example, consider a Session Initiation Protocol (SIP) server that initiates sessions from its known port 5060. Because all traffic from this IP address and port is generated by only the SIP application, the SIP application can be mapped to an IP address of the server and port 5060 for application identification. In this way, all traffic with this IP address and port is identified as SIP application traffic.

IP Protocol-Based Mapping

Standard IP protocol numbers can map an application to IP traffic. As with address mapping, to ensure an adequate security, use IP protocol mapping only in your private network for trusted servers.

Layer 7-Based Signatures

Layer 7 custom signatures define an application running over TCP or UDP or Layer 7 applications. Layer 7-based custom application signatures are required for the identification of multiple applications running on the same Layer 7 protocols. For example, applications such as Facebook and Yahoo Messenger can run over HTTP, but there is a need to identify them as two different applications running on the same Layer 7 protocol. The custom signature is cacheable for Layer 7 signatures only. You can create multiple signatures and each signature can contain multiple members up to maximum of 15 members.

Layer 7-based custom application signatures detect applications based on the patterns in HTTP contexts. However, some HTTP sessions are encrypted in SSL, also called Transport Layer Security (TLS). Application identification can extract the server name information or the server certification from the TLS or SSL sessions. It can also detect patterns in TCP or UDP payload in Layer 7 applications.

Release History Table

Release	Description
17.1	Starting in Junos Space Security Director 17.1, you can create the custom application identification for all devices running Junos OS Release 15.1X49-D40 and later.

RELATED DOCUMENTATION

Creating Application Signatures 439
Editing, Cloning, and Deleting Custom Application Signatures 444

Creating Application Signatures

Application identification supports custom application signatures to detect applications as they pass through the device. When you configure custom signatures, make sure that your signatures are unique. Use the Create Application Signature page to create custom application signatures for applications based on ICMP, IP protocol, IP address, and Layer 7.

Before you begin creating the custom application signatures:

- Make sure you have downloaded the application signature database package.

- The SRX Series device must be running Junos OS Release 15.1X49-D40 or later.

To create the custom application signatures:

1. Select **Configure > Application Firewall Policy > Signatures**.

The Application Signatures Page appears.

2. From the Create list, select **Signature**.

The Create Application Signature page appears.

3. Complete the configuration by using the guidelines in [Table 159 on page 440](#).

4. Click **OK** to complete the configuration or **Cancel** to discard the configuration.

Table 159: Fields on the Create Application Signature Page

Field	Description
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed; maximum length is 63 characters.
Description	Enter a description for the custom application signature; maximum length is 255 characters.
Order	Specify the order for the custom application. Lower order has higher priority. This option is used when multiple custom applications of the same type match the same traffic. However, you cannot use this option to prioritize among different type of applications such as TCP stream-based applications against TCP port-based applications or IP address-based applications against port-based applications.
Priority	Select the priority from the list over other signature applications.
<i>ICMP Mapping</i>	
ICMP Type	Specify the Internet Control Message Protocol (ICMP) value for an application to match. The ICMP mapping technique maps standard ICMP message types and optional codes to a unique application name. This mapping technique lets you differentiate between various types of ICMP messages. Select the numerical value of an ICMP type. The type field identifies the ICMP message.
ICMP Code	Select the numerical value of an ICMP code. The code field provides further information about the associated type field.
<i>IP Protocol Mapping</i>	

Table 159: Fields on the Create Application Signature Page (*continued*)

Field	Description
IP Protocol	Select the IP protocol value for an application to match. Standard IP protocol numbers can map an application to IP traffic. To ensure an adequate security similar to address mapping, use IP protocol mapping only in your private network for trusted servers.
<i>Address Mapping</i>	
Add Address Mapping	Use the Add Address Mapping page to create an address mapping that defines an application by the IP address and the port range of the traffic.
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed; maximum length is 63 characters.
IP Address	Enter an IPv4 or IPv6 address of the application for address mapping.
CIDR	Enter an IPv4 or IPV6 address prefixes for a classless addressing.
TCP Port Range	Enter the TCP port range for the application. Example: 1-200.
UDP Port Range	Enter the UDP port range for the application. Example: 1-200.
<i>L7 Signature</i>	
Cacheable	Set this option to TRUE to enable caching of application identification results. By enabling this option, you can cache the application detection result in an ASC table. If there is an entry in the ASC table, based on the destination IP address, protocol, and the port, you can identify AppID without sending the packet again to engine.
Add L7 Signature	<p>Select a protocol over which L7 signatures are added. The available options are:</p> <ul style="list-style-type: none"> • Over HTTP • Over SSL • Over TCP • Over UDP
Over Protocol	Shows the type of protocol that you have selected to add the L7 signature.
Signature Name	Enter the name of the custom application signature; maximum length is 63 characters.

Table 159: Fields on the Create Application Signature Page (*continued*)

Field	Description
Port Range	Enter the port range for the selected protocol. Range is 1-65535.
Add Members	Click the + sign to add members for a custom application signature. You can add maximum of 15 members.
Member Name	Member name for a custom application signature. Custom signatures can contain multiple members that define attributes for an application. (The supported member name range is m01 through m15.)
Context	<p>Select the context for matching the application running over TCP, UDP, or Layer 7.</p> <p>The available options are:</p> <ul style="list-style-type: none"> • http-get-url-parsed-param-parsed—The decoded and normalized GET URL in an HTTP request along with the decoded CGI parameters (if any). • http-header-content-type—The content-type header in an HTTP transaction. • http-header-cookie—The cookie header in an HTTP transaction. • http-header-host—The host header in an HTTP transaction. • http-header-user-agent—The user-agent header in an HTTP transaction. • http-post-url-parsed-param-parsed—The decoded and normalized POST URL in an HTTP request along with the decoded CGI parameters (if any). • http-post-variable-parsed—The decoded POST URL or form data variables. • http-url-parsed—The decoded and normalized URL in an HTTP request. • http-url-parsed-param-parsed—The decoded and normalized URL in an HTTP request along with the decoded CGI parameters (if any). • ssl-server-name—Server name in the TLS server name extension or the SSL server certificate. This is also known as Server Name Indication (SNI). • stream—TCP or UDP stream data.

Editing, Cloning, and Deleting Custom Application Signatures

IN THIS SECTION

- [Editing Custom Application Signatures | 444](#)
- [Cloning Custom Application Signatures | 445](#)
- [Deleting Custom Application Signatures | 445](#)

You can edit, clone, and delete the custom application signatures from the Application Signatures page. You clone a custom application signature to easily create a custom application signature. You delete the unused custom application signatures.

Editing Custom Application Signatures

To edit a custom application signature:

1. Select **Configure > Application Firewall Policy > Signatures**.

The Application Signatures page appears.

2. Select the custom application signature that you want to edit, and click the pencil icon.

The Edit Application Signatures page appears, showing the same fields that are displayed when you create a custom application signature.

3. Edit the application signatures fields as needed.

4. Click **OK** to save the changes.

The changes are saved and you are returned to the Application Signatures page.

Cloning Custom Application Signatures

To clone a custom application signature:

1. Select **Configure > Application Firewall Policy > Signatures**.

The Application Signatures page appears.

2. Select the custom application signature that you want to clone, and click the **Clone** button or select **Clone** from the More or right-click menu.

The Clone Application Signature page appears, showing the same fields that are displayed when you create a custom application signature.

3. Modify the application signature fields as needed.

4. Click **OK** to save the changes.

The cloned custom application signature is created and you are returned to the Application Signatures page.

Deleting Custom Application Signatures

To delete one or more custom application signatures:

1. Select **Configure > Application Firewall Policy > Signatures**.

The Application Signatures page appears.

2. Select the custom application signature that you want to delete, and click the **X** icon.

A warning dialog box appears asking you to confirm the deletion.

3. Click **Yes** to delete the selected custom application signatures.

The custom application signatures are deleted and you are returned to the Application Signature page.

RELATED DOCUMENTATION

[Creating Application Signatures | 439](#)

Creating Application Signature Groups

Juniper Networks regularly updates the predefined application signature database, making it available to subscribers on the Juniper Networks website. This package includes signature definitions of known application objects that can be used to identify applications for tracking, firewall policies, quality-of-service prioritization, and Intrusion Prevention System (IPS).

Use the Application Signature page to view application signatures that are already downloaded and to create custom application signature groups. The application signature page displays the name, object type, category and subcategory, risk, and characteristics of the signature. You can create custom application signature groups with a set of similar signatures for consistent reuse when defining policies.

NOTE: As of Junos OS Release 12.1x47 and later, the nested applications are called *applications*, with the same details converted as the members of application signature. These application signatures are called ngAppIDs. The Application Signature page shows only the ngAppID2.0 applications and application groups.

Before You Begin

- Make sure you have downloaded the application signature database package.
- Make sure that the latest updates have been applied.
- Review the Application Signature main page for an understanding of your current data set. See [“Application Signatures Main Page Fields” on page 447](#) for field descriptions.

Configuring Application Signature Group Settings

Application identification supports custom application signatures to detect applications as they pass through the device. When you configure custom signature groups, make sure that your signature groups are unique.

To configure application signature groups:

1. Select **Configure > Application Firewall Policy > Signatures**.
2. Click the + icon.
3. Complete the configuration according to the guidelines provided in [Table 161 on page 447](#).
4. Click **OK** to save.

Table 161: Application Signature Group Settings

Setting	Guideline
Name	Enter a unique name that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and maximum length is 63 characters.
Group Members	Click the + icon to add signatures to your application group. On the Add Application Signatures page, select the check boxes next to the signatures you want to add to the group.

SSL Profiles

IN THIS CHAPTER

- [SSL Forward Proxy Overview | 449](#)
- [Creating SSL Forward Proxy Profiles | 456](#)
- [SSL Forward Proxy Profile Main Page Fields | 460](#)
- [Creating SSL Reverse Proxy Profiles | 462](#)

SSL Forward Proxy Overview

Secure Sockets Layer (SSL) is an application-level protocol that provides encryption technology for the Internet. SSL, also called *Transport Layer Security* (TLS), ensures the secure transmission of data between a client and a server through a combination of privacy, authentication, confidentiality, and data integrity. SSL relies on certificates and private-public key exchange pairs for this level of security.

Server authentication guards against fraudulent transmissions by enabling a Web browser to validate the identity of a Web server. Confidentiality mechanisms ensure that communications are private. SSL enforces confidentiality by encrypting data to prevent unauthorized users from eavesdropping on electronic communications. Finally, message integrity ensures that the contents of a communication have not been tampered with.

SSL forward proxy is a transparent proxy; that is, it performs SSL encryption and decryption between the client and the server, but neither the server nor the client can detect its presence. SSL forward proxy ensures that it has the keys to encrypt and decrypt the payload:

- For the server, SSL forward proxy acts as a client—Because SSL forward proxy generates the shared pre-master key, it determines the keys to encrypt and decrypt.
- For the client, SSL forward proxy acts as a server—SSL forward proxy first authenticates the original server and replaces the public key in the original server certificate with a key that is known to it. It then generates a new certificate by replacing the original issuer of the certificate with its own identity and signs this new certificate with its own public key (provided as a part of the proxy profile configuration). When the client accepts such a certificate, it sends a shared pre-master key encrypted with the public key on the certificate. Because SSL forward proxy replaced the original key with its own key, it is able

to receive the shared pre-master key. Decryption and encryption take place in each direction (client and server), and the keys are different for both encryption and decryption.

Figure 51 on page 450 depicts how SSL inspection (on an existing SRX Series IPS module) is typically used to protect servers. SSL inspection requires access to private keys used by the servers so that the SRX Series device can decrypt the encrypted traffic.

Figure 51: SSL Inspection on an Existing SRX Series Device

Figure 52 on page 451 shows how SSL forward proxy works on an encrypted payload. When application firewall (AppFW), intrusion prevention system (IPS), or application tracking (AppTrack) is configured, SSL forward proxy acts as an SSL server terminating the SSL session from the client and a new SSL session is established to the server. The device decrypts and then re-encrypts all SSL forward proxy traffic. SSL forward proxy uses the following services:

- SSL-T-SSL terminator on the client side.
- SSL-I-SSL initiator on the server side.
- Configured AppFW, IPS, or AppTrack services use the decrypted SSL sessions.

NOTE: If none of the services (AppFW, IPS, or AppTrack) are configured, then SSL forward proxy services are bypassed even if an SSL proxy profile is attached to a firewall policy. IPS does not perform SSL inspection on a session if SSL forward proxy is enabled for that session. That is, if both SSL inspection and SSL forward proxy are enabled on a session, SSL forward proxy always takes precedence.

Figure 52: SSL Proxy on an Encrypted Payload

Supported Ciphers in Proxy Mode

An SSL cipher comprises encryption ciphers, authentication method, and compression. [Table 163 on page 452](#) displays a list of supported ciphers. NULL ciphers are excluded.

The following SSL protocols are supported:

- SSLv3
- TLS1

Table 163: Supported Ciphers in Proxy Mode

SSL Cipher	Key Exchange Algorithm	Data Encryption	Message Integrity
RSA_WITH_RC4_128_MD5	RSA key exchange	128-bit RC4	Message Digest 5 (MD5) hash
RSA_WITH_RC4_128_SHA	RSA key exchange	128-bit RC4	Secure Hash Algorithm (SHA) hash
RSA_WITH_DES_CBC_SHA	RSA key exchange	DES CBC	SHA hash
RSA_WITH_3DES_EDE_CBC_SHA	RSA key exchange	3DES EDE/CBC	SHA hash
RSA_WITH_AES_128_CBC_SHA	RSA key exchange	128-bit AES/CBC	SHA hash
RSA_WITH_AES_256_CBC_SHA	RSA key exchange	256-bit AES/CBC	SHA hash
RSA_EXPORT_WITH_RC4_40_MD5	RSA-export	40-bit RC4	MD5 hash
RSA_EXPORT_WITH_DES40_CBC_SHA	RSA-export	40-bit DES/CBC	SHA hash

RSA_EXPORT1024_WITH_RC4_56_SHA	RSA 1024 bit export	56-bit RC4	SHA hash
RSA-WITH-AES-256-GCM-SHA384	RSA key exchange	256-bit AES/GCM	SHA384 hash
RSA-WITH-AES-256-CBC-SHA256	RSA key exchange	256-bit AES/CBC	SHA256 hash
RSA-WITH-AES-128-GCM-SHA256	RSA key exchange	128-bit AES/GCM	SHA256 hash
RSA-WITH-AES-128-CBC-SHA256	RSA key exchange	128-bit AES/CBC	SHA256 hash

Server Authentication

Implicit trust between the client and the device (because the client accepts the certificate generated by the device) is an important aspect of SSL proxy. It is extremely important that server authentication is not compromised; however, in reality, self-signed certificates and certificates with anomalies are in abundance. Anomalies can include expired certificates, instances of common name not matching a domain name, and so forth.

Server authentication is governed by selecting the Ignore Server Authentication option in the SSL forward proxy profile.

If the Ignore Server Authentication option is not selected, the following scenarios occur:

- If authentication succeeds, a new certificate is generated by replacing the keys and changing the issuer name to the issuer name that is configured in the root CA certificate in the proxy profile.
- If authentication fails, the connection is dropped.

If the Ignore Server Authentication option is defined as an action in the SSL forward proxy profile, the following scenarios occur:

- If the certificate is self-signed, a new certificate is generated by replacing the keys only. The issuer name is not changed. This ensures that the client browser displays a warning that the certificate is not valid.
- If the certificate has expired or if the common name does not match the domain name, a new certificate is generated by replacing the keys and changing the issuer name to SSL-PROXY: DUMMY_CERT:GENERATED DUE TO SRVR AUTH FAILURE. This ensures that the client browser displays a warning that the certificate is not valid.

Trusted CA List

SSL forward proxy ensures secure transmission of data between a client and a server. Before establishing a secure connection, SSL forward proxy checks certificate authority (CA) certificates to verify signatures on server certificates. For this reason, a reasonable list of trusted CA certificates is required to effectively authenticate servers.

Ignore Server Authentication

You can use the Ignore Server Authentication option to ignore server authentication completely. In this case, SSL forward proxy ignores errors encountered during the server certificate verification process (such as CA signature verification failure, self-signed certificates, and certificate expiry).

We do not recommend this option for authentication, because configuring it results in websites not being authenticated at all. However, you can use this option to effectively identify the root cause for dropped SSL sessions.

Root CA

In a public key infrastructure (PKI) hierarchy, the root CA is at the top of the trust path. The root CA identifies the server certificate as a trusted certificate.

Session Resumption

An SSL session refers to the set of parameters and encryption keys created by performing a full handshake. A connection is the conversation or active data transfer that occurs within the session. The computational overhead of a complete SSL handshake and generation of master keys is considerable. In short-lived sessions, the time taken for the SSL handshake can be more than the time for data transfer. To improve

throughput and still maintain an appropriate level of security, SSL session resumption provides a session caching mechanism so that session information, such as the pre-master secret key and agreed-upon ciphers, can be cached for both the client and server. The cached information is identified by a session ID. In subsequent connections both parties agree to use the session ID to retrieve the information rather than create a new pre-master secret key. Session resumption shortens the handshake process and accelerates SSL transactions.

SSL Proxy Logs

When logging is enabled in an SSL proxy profile, SSL proxy can generate the messages shown in [Table 164 on page 454](#).

Table 164: SSL Proxy Logs

Log Type	Description
SSL_PROXY_SSL_SESSION_DROP	Logs generated when a session is dropped by SSL proxy.
SSL_PROXY_SSL_SESSION_ALLOW	Logs generated when a session is processed by SSL proxy even after encountering some minor errors.
SSL_PROXY_SESSION_IGNORE	Logs generated if non-SSL sessions are initially mistaken as SSL sessions.
SSL_PROXY_SESSION_WHITELIST	Logs generated when a session is whitelisted.
SSL_PROXY_ERROR	Logs used for reporting errors.
SSL_PROXY_WARNING	Logs used for reporting warnings.
SSL_PROXY_INFO	Logs used for reporting general information.

All logs contain similar information; the message field contains the reason for the log generation. One of three prefixes shown in [Table 165 on page 454](#) identifies the source of the message. Other fields are descriptively labeled.

Table 165: SSL Proxy Log Prefixes

Prefix	Description
system	Logs generated due to errors related to the device or an action taken as part of the SSL proxy profile. Most logs fall into this category.
openssl error	Logs generated during the handshaking process if an error is detected by the openssl library.

Table 165: SSL Proxy Log Prefixes (*continued*)

Prefix	Description
certificate error	Logs generated during the handshaking process if an error is detected in the certificate (x509 related errors).

Perfect Forward Secrecy

Perfect Forward Secrecy is a specific key agreement protocol that provides assurance that your session keys are not compromised even if the private key of the server is compromised. By generating a unique session key for every session a user initiates, even if a single session keys gets compromised does not affect any data other than that exchanged in a specific session protected by that particular key.

The Elliptic Curve DHE (ECDHE) cipher suits are supported to enable the perfect forward secrecy on SSL forward proxy. The SSL forward proxy still uses RSA for authentication. However, it uses EC Diffie-Hellman ephemeral key exchange to agree on a shared secret.

ECDHE cipher suites are faster than the DHE counterparts and therefore, the SSL forward proxy supports only ECDHE cipher suits. The ECDHE cipher suits are based on the elliptic curve cryptography which allows you to achieve the same level of security than RSA with smaller keys. For example, a 224 bit elliptic curve is as secure as a 2048 bit RSA key.

[Table 166 on page 455](#) shows the supported ECDHE cipher suits.

Table 166: Supported ECDHE Cipher Suits

SSL Cipher	Key Exchange Algorithm	Data Encryption	Message Integrity
ECDHE-RSA-WITH-AES-256-GCM-SHA384	ECDHE RSA	256-bit AES/GCM	SHA 384 hash
ECDHE-RSA-WITH-AES-256-CBC-SHA384	ECDHE RSA	256-bit AES/CBC	SHA 384 hash
ECDHE-RSA-WITH-AES-256-CBC-SHA	ECDHE RSA	256-bit AES/CBC	SHA hash
ECDHE-RSA-WITH-AES-3DES-EDE-CBC-SHA	ECDHE RSA	3DES AES/EDE/CBC	SHA hash
ECDHE-RSA-WITH-AES-128-GCM-SHA256	ECDHE RSA	128-bit AES/GCM	SHA 256 hash
ECDHE-RSA-WITH-AES-128-CBC-SHA256	ECDHE RSA	128-bit AES/CBC	SHA 256 hash
ECDHE-RSA-WITH-AES-128-CBC-SHA	ECDHE RSA	128-bit AES/CBC	SHA hash

RELATED DOCUMENTATION

[Creating SSL Forward Proxy Profiles](#) | 456

[Creating Firewall Policies](#) | 358

Creating SSL Forward Proxy Profiles

Use the SSL Forward Proxy Profile page to view and manage SSL proxy profile details. SSL proxy is enabled as an application service within a security policy. You specify the traffic that you want the SSL proxy enabled on as match criteria and then specify the SSL proxy profile to be applied to the traffic.

Before You Begin

- Read the SSL Forward Proxy Overview topic.
- Review the SSL Forward Proxy Profile main page for an understanding of your current data set. See [“SSL Forward Proxy Profile Main Page Fields” on page 460](#) for field descriptions.

Configuring SSL Forward Proxy Profile Settings

To create an SSL forward proxy profile:

1. Select **Configure > SSL Profiles> SSL Proxy Profiles**.
The SSL Proxy Profiles page appears.
2. Select **Forward Proxy** from the Create list.
3. Complete the configuration according to the guidelines provided in [Table 167 on page 457](#).
4. Click **OK**.

An SSL forward proxy profile is created that can be assigned to a firewall policy for advanced security options.

NOTE: If none of the services (AppFW, IDP, or AppTrack) are configured, then SSL proxy services are bypassed even if an SSL proxy profile is attached to a firewall policy.

Table 167: SSL Forward Proxy Profile Settings

Setting	Guideline
<i>General Information</i>	
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed; maximum length is 63 characters.
Description	Enter a description for the SSL forward proxy profile; maximum length is 1024 characters.
Preferred Cipher	<p>Select a preferred cipher. Ciphers are divided into the following categories depending on their key strength.</p> <ul style="list-style-type: none"> • Custom—Configure custom cipher suite and order of preference. • Medium—Use ciphers with key strength of 128 bits or greater. • Strong—Use ciphers with key strength of 168 bits or greater. • Weak—Use ciphers with key strength of 40 bits or greater.

Table 167: SSL Forward Proxy Profile Settings (continued)

Setting	Guideline
Custom Ciphers	<p>Select the set of ciphers the SSH server can use to perform encryption and decryption functions. If this option is not configured, the server accepts any supported suite that is available.</p> <p>The available custom ciphers are:</p> <ul style="list-style-type: none"> • rsa-with-RC4-128-md5—RSA, 128-bit RC4, MD5 hash • rsa-with-RC4-128-sha—RSA, 128-bit RC4, SHA hash • rsa-with-des-cbc-sha—RSA, DES/CBC, SHA hash • rsa-with-3DES-ede-cbc-sha—RSA, 3DES EDE/CBC, SHA hash • rsa-with-aes-128-cbc-sha—RSA, 128-bit AES/CBC, SHA hash • rsa-with-aes-256-cbc-sha—RSA, 256 bit AES/CBC, SHA hash • rsa-export-with-rc4-40-md5—RSA-export, 40 bit RC4, MD5 hash • rsa-export-with-des40-cbc-sha—RSA-export, 40 bit DES/CBC, SHA hash • rsa-export1024-with-des-cbc-sha—RSA 1024 bit export, DES/CBC, SHA hash • rsa-export1024-with-rc4-56-md5—RSA 1024 bit export, 56 bit RC4, MD5 hash • rsa-export1024-with-rc4-56-sha—RSA 1024 bit export, 56 bit RC4, SHA hash • rsa-with-aes-256-gcm-sha384—RSA, 256 bit AES/GCM, SHA384 hash • rsa-with-aes-256-cbc-sha256—RSA, 256 bit AES/CBC, SHA256 hash • rsa-with-aes-128-gcm-sha256—RSA, 128 bit AES/GCM, SHA256 hash • rsa-with-aes-128-cbc-sha256—RSA, 256 bit AES/CBC, SHA256 hash • ecdhe-rsa-with-aes-256-gcm-sha384—ECDHE, RSA, 256 bit AES/GCM, SHA384 hash • ecdhe-rsa-with-aes-256-cbc-sha384—ECDHE, RSA, 256 bit AES/CBC, SHA384 hash • ecdhe-rsa-with-aes-256-cbc-sha—ECDHE, RSA, 256 bit AES/CBC, SHA hash • ecdhe-rsa-with-aes-3des-ede-cbc-sha—ECDHE, RSA, 3DES, EDE/CBC, SHA hash • ecdhe-rsa-with-aes-128-gcm-sha256—ECDHE, RSA, 128 bit AES/GCM, SHA256 hash • ecdhe-rsa-with-aes-128-cbc-sha256—ECDHE, RSA, 128 bit AES/CBC, SHA256 hash • ecdhe-rsa-with-aes-128-cbc-sha—ECDHE, RSA, 128 bit AES/CBC, SHA hash
Flow Trace	Select this option to enable flow trace for troubleshooting policy-related issues.
Root Certificate	<p>Select or add a root certificate. In a public key infrastructure (PKI) hierarchy, the root CA is at the top of the trust path. The root CA identifies the server certificate as a trusted certificate.</p> <p>Click Add for a new root certificate. On the Add page, select a device and the trusted CAs to associate to the root certificate.</p>

Table 167: SSL Forward Proxy Profile Settings (*continued*)

Setting	Guideline
Exempted Address	<p>Select addresses to create whitelists that bypass SSL forward proxy processing.</p> <p>Because SSL encryption and decryption are complicated and expensive procedures, network administrators can selectively bypass SSL proxy processing for some sessions. Such sessions mostly include connections and transactions with trusted servers or domains with which network administrators are very familiar. There are also legal requirements to exempt financial and banking sites. Such exemptions are achieved by configuring the IP addresses or domain names of the servers under whitelists.</p>
Exempted URL Categories	<p>Starting in Junos Space Security Director Release 16.2, you can select URL categories to create whitelists that bypass SSL forward proxy processing.</p> <p>These URL categories are exempted during SSL inspection. Only the predefined URL categories can be selected for the exemption.</p>
<i>Actions</i>	
Server Authentication Failure	<p>Select this option to ignore server authentication completely.</p> <p>In this case, SSL forward proxy ignores errors encountered during the server certificate verification process (such as CA signature verification failure, self-signed certificates, and certificate expiry).</p> <p>We do not recommend this option for authentication, because configuring it results in websites not being authenticated at all. However, you can use this option to effectively identify the root cause for dropped SSL sessions.</p>
Session Resumption	<p>Select the Disable Session Resumption option if you do not want session resumption.</p> <p>To improve throughput and still maintain an appropriate level of security, SSL session resumption provides a session caching mechanism so that session information, such as the pre-master secret key and agreed-upon ciphers, can be cached for both the client and server.</p>
Log	<p>Select this option to generate logs. You can choose to log all events, warnings, general information, errors, or different sessions (whitelisted, allowed, dropped, or ignored).</p>

Table 167: SSL Forward Proxy Profile Settings (*continued*)

Setting	Guideline
Renegotiation	<p>After a session is created and SSL tunnel transport has been established, a change in SSL parameters requires renegotiation. SSL forward proxy supports both secure (RFC 5746) and nonsecure (TLS v1.0 and SSL v3) renegotiation.</p> <p>Select one of the following options if a change in SSL parameters requires renegotiation:</p> <ul style="list-style-type: none"> • None (selected by default) • Allow • Allow-secure • Drop <p>When session resumption is enabled, session renegotiation is useful in the following situations:</p> <ul style="list-style-type: none"> • Cipher keys need to be refreshed after a prolonged SSL session. • Stronger ciphers need to be applied for a more secure connection.

Release History Table

Release	Description
16.2	Starting in Junos Space Security Director Release 16.2, you can select URL categories to create whitelists that bypass SSL forward proxy processing.

SSL Forward Proxy Profile Main Page Fields

Use the SSL Forward Proxy Profile page to view and manage SSL proxy profile details. SSL proxy is enabled as an application service within a security policy. You specify the traffic that you want the SSL proxy enabled on as match criteria and then specify the SSL proxy profile to be applied to the traffic. You can filter and sort this information to get a better understanding of what you want to view. [Table 168 on page 461](#) describes the fields on this page.

Table 168: SSL Forward Proxy Profile Main Page Fields

Field	Description
Name	Unique string of alphanumeric characters, colons, periods, dashes, and underscores; no spaces allowed; 63-character maximum.
Preferred Cipher	Ciphers are divided into three categories depending on their key strength. Strong ciphers are 168 bits or greater; medium ciphers are 128 bits or greater; and weak ciphers are 40 bits or greater. The default is custom, which allows you to configure your own cipher suite.
Custom Ciphers	Ciphers selected from each of the categories (Strong, Medium, Weak) to form a custom cipher suite.
Exempted Address	Addresses that are selected to bypass SSL forward proxy processing. This allows you to create whitelists and avoid the expense and complication of SSL encryption.
Server Authentication Failure	This option ignores errors encountered during the server certificate verification process (such as CA signature verification failure, self-signed certificates, and certificate expiry).
Session Resumption	This option enables or disables depending on whether you want session resumption (session caching mechanism).
Domain	Domain name to which the SSL forward proxy profile is associated. The IP addresses associated with domain names are dynamic and can change at any time.
Description	Description for the SSL proxy profile; maximum length is 1024 characters.

Creating SSL Reverse Proxy Profiles

Use the SSL Reverse Proxy Profiles page to configure the SSL reverse proxy to protect your SSL-enabled web servers against client-to-server attacks from malicious clients. This functions by loading the SSL private key onto the SRX Series device to protect your clients against threats from web servers that you do not control. For example, if an external user on the internet is trying to access a corporate web server, they initiate the HTTPS connection to the web server. The IPS policy which has the private key of the web server intercepts the traffic, inspects it for attacks, and if no attacks are present, it forwards it onto the destination web server.

To create an SSL reverse proxy profile:

1. Select **Configure > SSL Profiles > SSL Proxy Profiles**.

The SSL Proxy Profiles page appears.

2. Select **Reverse Proxy** from the Create list.

3. Complete the configuration according to the guidelines provide in [Table 169 on page 462](#).

4. Click **OK**.

An SSL reverse proxy profile is created that can be assigned to a firewall policy for advanced security options.

Table 169: Fields on the Create SSL Reverse Proxy Profile Page

Field	Description
<i>General Information</i>	
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed; maximum length is 63 characters.
Description	Enter a description for the SSL forward proxy profile; maximum length is 1024 characters.
Preferred Cipher	<p>Select a preferred cipher. Ciphers are divided into the following categories depending on their key strength.</p> <ul style="list-style-type: none"> • Custom—Configure custom cipher suite and order of preference. • Medium—Use ciphers with key strength of 128 bits or greater. • Strong—Use ciphers with key strength of 168 bits or greater. • Weak—Use ciphers with key strength of 40 bits or greater.

Starting in Junos Space Security Director Release 16.1, you can use the Active Directory Profile page to configure the Active Directory profile as an authentication server.

Tasks You can Perform

You can perform the following tasks from this page:

- Create an Active Directory profile. See [“Creating Active Directory Profiles” on page 468](#).
- Modify or delete an existing Active Directory profile. See [“Editing and Deleting Active Directory Profiles” on page 473](#).
- Deploy the Active Directory profile to SRX Series devices. See [“Deploying the Active Directory Profile to SRX Series Devices” on page 472](#).

Field Descriptions

Table 170 on page 467 provides guidelines on using the fields on the Active Directory page.

Table 170: Fields on the Active Directory Profile Page

Field	Description
Name	Specifies the name of the Active Directory.
Description	Describes the Active Directory.
Domain	Specifies the domain for which the status is displayed. Example: Global
Devices	Lists the assigned devices for a directory. Example: SRX
Active Directory Domains	Specifies the domains of the Active Directory. Example: domain.net

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, you can use the Active Directory Profile page to configure the Active Directory profile as an authentication server.

Creating Active Directory Profiles

Use the Create Active Directory Profile page to configure the IP address-to-user mapping information and the user-to-group mapping information to access the LDAP server.

To create an Active Directory profile:

1. Select **Configure > User Firewall Management > Active Directory**.

The Active Directory Profile page appears.

2. Click the + icon.

3. Complete the configuration by using the guidelines in [Table 171 on page 468](#).

4. Click **Finish**.

A Summary page providing a preview of the complete configuration appears.

5. Click **OK** to complete the configuration or **Back** to make any modifications.

Table 171: Fields on the Create Active Directory Profile Page

Field	Description
<i>General Information</i>	
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. Maximum length is 255 characters.
Description	Enter a description for the Active Directory profile; maximum length is 255 characters.
On Demand Probe	<p>Enable the manual on-demand probing of a domain PC as an alternate method for the SRX Series device to retrieve address-to-user mapping information.</p> <p>By default, the manual on-demand probing is not enabled.</p>
<i>Timeout</i>	

Table 171: Fields on the Create Active Directory Profile Page (continued)

Field	Description
Authentication Entry Timeout	<p>Set the timeout to 0 to avoid having the user's entry being removed from the authentication table after the timeout.</p> <p>Note that when a user is no longer active, a timer is started for that user's entry in the Active Directory authentication table. When the time is up, the user's entry is removed from the table. Entries in the table remain active as long as there are sessions associated with the entry.</p> <p>The default authentication entry timeout is thirty minutes. To disable timeout, set the interval to zero. The range is 10 through 1440 minutes.</p>
WMI Timeout	<p>Configure the number of seconds that the domain PC has to respond to the SRX Series device's query through Windows Management Instrumentation (WMI) or Distributed Component Object Module (DCOM).</p> <p>If no response is received from the domain PC within the wmi-timeout interval, the probe fails and the system either creates an invalid authentication entry or updates the existing authentication entry as invalid. If an authentication table entry already exists for the probed IP address, and no response is received from the domain PC within the wmi-timeout interval, the probe fails and that entry is deleted from the table.</p> <p>The range is 3 through 120 seconds.</p>
<i>Filter</i>	
Filter	<p>Set the range of IP addresses that must be monitored or not monitored.</p> <ul style="list-style-type: none"> • Include—Specify to include IP addresses from the Available column. • Exclude—Specify to exclude IP addresses from the Available column. <p>Click Add New Address to create a new IP address and add it as either include or exclude from monitoring.</p>
<i>Add Domain Settings</i>	

Table 171: Fields on the Create Active Directory Profile Page (continued)

Field	Description
Domain Name	<p>Enter the name of the domain; the length of the name ranges from 1 through 64 characters. The SRX Series device can have the integrated user firewall configured in a maximum of two domains.</p> <p>Example: example.net</p>
Description	<p>Enter a description for the LDAP server domain; maximum length is 255 characters.</p>
Username	<p>Enter the Active Directory account name. The range is 1 through 64 characters.</p> <p>Example: administrator</p>
Password	<p>Enter the password of the Active Directory account. The range is 1 through 128 characters.</p> <p>Example: \$ABC123</p>
Domain Controller(s)	<p>Click the plus(+) sign to create new domain controllers.</p> <ul style="list-style-type: none"> Domain Controller Name— Name can range from 1 through 64 characters. A maximum of 10 domain controllers can be configured. IP Address—IP address of the domain controller.
<i>User Group Mapping(LDAP)</i>	
IP Address	<p>Specify the IP address of the LDAP server. If no address is specified, the system uses one of the configured Active Directory domain controllers.</p> <p>Example: 192.0.2.15</p>
Port	<p>Specify the port number of the LDAP server. If no port number is specified, the system uses port 389 for plaintext or port 636 for encrypted text.</p>
Base DN	<p>Enter the LDAP base distinguished name (DN).</p> <p>Example: DC=example,DC=net</p>

Table 171: Fields on the Create Active Directory Profile Page (*continued*)

Field	Description
Username	<p>Enter the username of the LDAP account. If no username is specified, the system will use the configured domain controller's username.</p> <p>Example: administrator</p>
Password	<p>Enter the password for the account. If no password is specified, the system uses the configured domain controller's password.</p> <p>Example: xxxxx</p>
Use SSL	<p>Enable Secure Sockets Layer (SSL) to ensure secure transmission with the LDAP server. Disabled by default, then the password is sent in plaintext.</p>
Authentication Algorithm	<p>Specify the algorithm used while the SRX Series device communicates with the LDAP server. By default simple is selected to configure simple(plaintext) authentication mode.</p>
<i>IP-User Mapping</i>	
Discovery Method	<p>Enable the method of discovering IP address-to-user mappings.</p> <ul style="list-style-type: none"> WMI—Windows Management Instrumentation (WMI) is the discovery method used to access the domain controller.
Event Log Scanning Interval	<p>Enter the scanning interval at which the SRX Series device scans the event log on the domain controller. The range is 5 through 60 seconds.</p>
Initial Event Log TimeSpan	<p>Enter the time of the earliest event log on the domain controller that the SRX Series device will initially scan. This scan applies to the initial deployment only. After WMIC and the user identification start working, the SRX Series device scans only the latest event log.</p> <p>The range is 1 through 168 hours.</p>

Deploying the Active Directory Profile to SRX Series Devices

To deploy the active directory profile to SRX Series devices:

1. Select **Configure > User Firewall Management > Active Directory**.

The Active Directory Profile page appears.

2. Select the active directory profile that you want to deploy, and click **Update**.

The Update Active Directory Profile page appears. See [Table 172 on page 473](#) to view more details.

3. Select the required SRX Series device to deploy the active directory profile, and click **Update**.

A new job is created.

4. Click the job ID to see the update status.

The Job Management page appears showing the state of the updated job. You can also view the deployed active directory profile information under the Parameters column.

Table 172: Update Active Directory Profile Page Fields

Column Name	Description
Device Name	Name of the SRX Series device.
Configuration	The active directory profile configuration can be viewed in either CLI or XML by clicking View .
Configuration Status	<p>Configuration status of the device. The different configuration states for a device are as follows:</p> <ul style="list-style-type: none"> • Synchronizing—During the device update, the status is shown as Synchronizing. • Sync Failed—The synchronization operation failed. • In Sync—The synchronization operation completed successfully; Security Director and the device are synchronized.
Connection Status	Connection status of the device. The status shows either UP or Down.
Domain	Domain of the user.
Device IP	IP address of the device.
Platform	Platform of the device. For example, SRX Series, vSRX.
OS Version	Junos OS version running on the device.

RELATED DOCUMENTATION

[Editing and Deleting Active Directory Profiles | 473](#)

Editing and Deleting Active Directory Profiles

IN THIS SECTION

- [Editing Active Directory Profiles | 474](#)

- [Deleting Active Directory Profiles | 474](#)

You can edit and delete Active Directory profiles. This topic contains the following sections:

Editing Active Directory Profiles

To edit an Active Directory profile:

1. Select **Configure > User Firewall Management > Active Directory**.

The Active Directory Profile page appears listing the existing Active Directory profiles.

2. Select the Active Directory profile that you want to edit, right-click and select **Edit Active Directory Profile**, or click the pencil icon.

The Edit Active Directory Profile page appears, showing the same options as when creating a new Active Directory profile.

3. Click **Finish** after completing editing.

Deleting Active Directory Profiles

To delete an Active Directory profile from all devices:

1. Select **Configure > User Firewall Management > Active Directory**.

The Active Directory Profile page appears listing the existing Active Directory profiles.

2. Select the active directory profile that you want to delete, right-click and select **Delete Active Directory Profile**, or click the delete icon.

This deletes the selected active directory profile from all the SRX Series devices. An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

You can unassign a device and delete the Active Directory profile from it.

To unassign a device:

1. Select **Configure > User Firewall Management > Active Directory**.

The Active Directory Profile page appears listing the existing access profiles.

2. Select the active directory profile that you want to edit, right-click and select **Edit Active Directory Profile**, or click the pencil icon.

The Edit Active Directory Profile page appears, showing the same options as when creating a new access profile.

3. Go to the Assign Device section.
4. Move the required device(s) listed under the Selected column to the Available column.
5. Click **Finish**.

The active directory profile configuration is deleted from the selected device(s).

- [LDAP Server Username, Password, and Server Address | 477](#)

The topics in this section use the term *Lightweight Directory Access Protocol (LDAP)* to apply specifically to LDAP functionality within the integrated user firewall feature.

This topic includes the following sections:

Understanding the Role of LDAP in an Integrated User Firewall

SRX Series devices use the Lightweight Directory Access Protocol (LDAP) to get user and group information necessary to implement the integrated user firewall feature. The SRX Series device acts as an LDAP client communicating with an LDAP server. In a common implementation scenario, the domain controller acts

as the LDAP server. The LDAP module in the SRX Series device, by default, queries the Active Directory in the domain controller.

The SRX Series device downloads user and group lists from the LDAP server. The device also queries the LDAP server for user and group updates. The SRX Series device downloads a first-level, user-to-group mapping relationship and then calculates a full user-to-group mapping.

Understanding the LDAP Server Configuration and Base Distinguished Name

Most of the LDAP server configuration is optional, because the common implementation uses the domain controller as the LDAP server. The SRX Series device periodically (every two minutes) queries the LDAP server to get the user and group information changed since the last query.

The only required LDAP server configuration is the LDAP base distinguished name (DN), which is at the top level of the LDAP directory tree. Microsoft Active Directory follows the convention of deriving the base DN from a company's Domain Name System (DNS) domain components. An example of a base DN is `dc=juniper, dc=net`.

LDAP Authentication Method

By default, the LDAP authentication method uses simple authentication. The client's username and password are sent to the LDAP server in plaintext. Keep in mind that the password is clear and can be read from the network.

To avoid exposing the password, you can use simple authentication within an encrypted channel, namely Secure Sockets layer (SSL), as long as the LDAP server supports LDAP over SSL. After enabling SSL, the data sent from the LDAP server to the SRX Series device is encrypted.

LDAP Server Username, Password, and Server Address

The LDAP server's username, password, IP address, and port are all optional, but they can be configured.

- If the username and password are not configured, the system uses the configured domain controller's username and password.
- If the LDAP server's IP address is not configured, the system uses the address of one of the configured Active Directory domain controllers.
- If the port is not configured, the system uses port 389 for plaintext or port 636 for encrypted text.

About the Access Profile Page

IN THIS SECTION

- [Tasks You Can Perform | 478](#)
- [Field Descriptions | 478](#)

To access this page, click **Configure > User Firewall Management > Access Profile**.

Starting in Security Director Release 16.1, you can use the Access Profile page to configure the Lightweight Directory Access Protocol (LDAP) for SRX Series devices that use the integrated user firewall feature. The SRX Series device acts as an LDAP client communicating with an LDAP server.

Tasks You Can Perform

You can perform the following tasks from this page:

- Create an access profile. See [“Creating Access Profiles” on page 480](#).
- Modify or delete an existing access profile. See [“Editing and Deleting Access Profiles” on page 485](#).
- Deploy the access profile to SRX Series devices. See [“Deploying the Access Profile to SRX Series Devices” on page 483](#).

Field Descriptions

[Table 173 on page 478](#) provides guidelines on using the fields on the Access Profile page.

Table 173: Access Profile Main Page Fields

Field	Description
Name	Name of the access profile.

Table 173: Access Profile Main Page Fields (*continued*)

Field	Description
Authentication Order	Shows the order in which Junos OS tries different authentication methods when verifying that a client can access the devices.
Authentication Order 2	Shows the next authentication method if the authentication method included in the authentication order option is not available, or if the authentication is available but returns a reject response.
Description	Describes the access profile.
LDAP Server (Address)	Specifies the IP address of the LDAP authentication server.
Domain	Specifies the domain for which the status is displayed.
Devices	Lists the assigned devices for a profile.
LDAP Options (Base Distinguished Name)	Shows the series of basic properties that define the user. For example, in the base distinguished name o=juniper, c=us, where o for organization, and c stands for country.

Release History Table

Release	Description
16.1	Starting in Security Director Release 16.1, you can use the Access Profile page to configure the Lightweight Directory Access Protocol (LDAP) for SRX Series devices that use the integrated user firewall feature.

RELATED DOCUMENTATION

Creating Access Profiles

Use the Access Profile page to configure LDAP server.

To configure LDAP server:

1. Select **Configure > User Firewall Management > Access Profile**.
2. Click the + icon.
3. Complete the configuration by using the guidelines in [Table 174 on page 480](#).
4. Click **Finish**.

A Summary page providing a preview of the complete configuration is shown.

5. Click **OK** to complete the configuration or **Back** to make any modifications.

Table 174: LDAP Server Configuration Parameters

Field	Description
<i>General Setting</i>	
Access Profile Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. Maximum length is 255 characters.
Description	Enter a description for the access profile; maximum length is 255 characters.
<i>Authentication Order</i>	

Table 174: LDAP Server Configuration Parameters (*continued*)

Field	Description
Order 1	<p>Configure the order in which the different user authentication methods are tried when a user attempts to log in. For each login attempt, the method for authentication starts with the first one, until the password matches.</p> <p>The method can be one or more of the following:</p> <ul style="list-style-type: none"> • NONE—No authentication for the specified user. • LDAP—Use LDP. The SRX Series device uses this protocol to get user and group information necessary to implement the integrated user firewall feature. • Password—Use a locally configured password in the access profile. <p>You can set the password to none or configure for the following authentication orders:</p> <ul style="list-style-type: none"> • LDAP • Radius servers • Secure ID • Radius—Use RADIUS authentication services. <p>If RADIUS servers fail to respond or return a reject response, try password authentication, because it is explicitly configured in the authentication order.</p> • Secure ID—Configure the RSA SecurID authentication. <p>Users can enter either static or dynamic passwords as their credentials. A dynamic password is a combination of a user's PIN and a randomly generated token that is valid for a short period of time, approximately one minute. A static password is configured for the user on the SecurID server. For example, the SecurID server administrator might set a temporary static password for a user who lost his or her SecurID token.</p>
Order 2	<p>Configure the next authentication method if the authentication method included in the authentication order option is not available, or if the authentication is available but returns a reject response.</p>
<i>Add LDAP Server</i>	
Address	Enter the IPv4 or hostname of the LDAP authentication server.
Port	Configure the port number on which to contact the LDAP server. The range is 1 through 65,535.
Retry	Specify the number of retries that a device can attempt to contact an LDAP server. The range is 1 through 10.
Routing Instance	Configure the routing instance used to send LDAP packets to the LDAP server. A routing instance is a collection of routing tables, the interfaces contained in the routing tables, and the routing protocol parameters that control the information in the routing tables.

Table 174: LDAP Server Configuration Parameters (*continued*)

Field	Description
Source Address	Configure a source address for each configured LDAP server. Each LDAP request sent to an LDAP server uses the specified source address.
Timeout	Configure the amount of time that the local device waits to receive a response from an LDAP server. The range is 3 to 90 seconds.
<i>LDAP Options</i>	
Assemble	Specify that a user's LDAP distinguished name is assembled through the use of a common name identifier, the username, and base distinguished name.
Common Name	Enter a common name identifier used as a prefix for the username during the assembly of the user's distinguished name. For example, uid specifies "user id," and cn specifies "common name."
Base Distinguished Name	<p>Specify the base distinguished name, which can be used in one of the following ways:</p> <ul style="list-style-type: none"> • If you use the Assemble option to assemble the user's distinguished name and the base distinguished name is appended to a username to generate the user's distinguished name. The resulting distinguished name is used in the LDAP bind call. • If you are using the search filter to search for the user's distinguished name. The search is restricted to the subtree of the base distinguished name. <p>The base distinguished name is a series of basic properties that define the user. For example, in the base distinguished name, o=juniper, c=us, where o for organization, and c stands for country.</p>
Revert Interval	Specify the amount of time that elapses before the primary server is contacted if a backup server is being used. The range is 60 through 4,294,967,295 seconds.
Search Filter	Specify the name of the filter to find the user's LDAP distinguished name. For example, a filter cn specifies that the search matches a user whose common name is the username.
Admin Search	Perform an LDAP administrator search. By default, the search is an anonymous search. To perform an administrator search, you must specify administrator credentials, which are used in the bind as part of performing the search.
Distinguished Name	<p>Specify the distinguished name of an administrative user. The distinguished name is used in the bind for performing the LDAP search.</p> <p>For example, cn=admin, ou=eng, o=juniper, dc=net.</p>

Table 174: LDAP Server Configuration Parameters (*continued*)

Field	Description
Password	Configure the plain-text password for the administrative user. This password is used in the bind for performing the LDAP search.
<i>Assign Device</i>	
Device	<p>Select these devices from the Available column and move them to the Selected column.</p> <p>You can also search for the devices in the search field in both the Available and Selected columns. You can search these devices by entering the device name, device IP address, or device tag.</p>

Deploying the Access Profile to SRX Series Devices

To deploy the access profile to SRX Series devices:

1. Select **Configure > User Firewall Management > Access Profile**.

The Access Profile page appears.

2. Select the access profile that you want to deploy, and click **Update**.

The Update Access Profile page appears. See [Table 175 on page 484](#) for more information.

3. Select the required SRX Series device to deploy the access profile, and click **Update**.

A new job is created.

4. Click the job ID to see the update status.

The Job Management page appears showing the state of the updated job. You can also view the deployed access profile information under the Parameters column.

Table 175: Update Access Profile Page Fields

Column Name	Description
Device Name	Name of the SRX Series device.
Configuration	The access profile configuration can be viewed in either CLI or XML by clicking View .
Configuration Status	<p>Configuration status of the device. The different configuration states for a device are as follows:</p> <ul style="list-style-type: none"> • Synchronizing—During the device update, the status is shown as Synchronizing. • Sync Failed—The synchronization operation failed. • In Sync—The synchronization operation completed successfully; Security Director and the device are synchronized.
Connection Status	Connection status of the device. The status shows either UP or Down.
Domain	Domain of the user.
Device IP	IP address of the device.
Platform	Platform of the device. For example, SRX Series, vSRX.
OS Version	Junos OS version running on the device.

Editing and Deleting Access Profiles

IN THIS SECTION

- [Editing Access Profiles | 485](#)
- [Deleting Access Profiles | 485](#)

You can edit and delete access profiles. This topic contains the following sections:

Editing Access Profiles

To edit an access profile:

1. Select **Configure > User Firewall Management > Access Profile**.

The Access Profile page appears listing the existing access profiles.

2. Select the access profile that you want to edit, right-click and select **Edit Access Profile**, or click the pencil icon.

The Edit Access Profile page appears, showing the same options as when creating a new access profile.

3. Click **Finish** after completing editing.

Deleting Access Profiles

To delete an access profile from all devices:

1. Select **Configure > User Firewall Management > Access Profile**.

The Access Profile page appears listing the existing access profiles.

2. Select the access profile that you want to delete, right-click and select **Delete Access Profile**, or click the delete icon.

This deletes the selected access profile from all the SRX Series devices. An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

To delete an access profile from selected devices:

1. Select **Configure > User Firewall Management > Access Profile**.

The Access Profile page appears listing the existing access profiles.

2. Select the access profile that you want to edit, right-click and select **Edit Access Profile**, or click the pencil icon.

The Edit Access Profile page appears, showing the same options as when creating a new access profile.

3. Go to the Assign Device section.

4. Move the required device(s) listed under the Selected column to the Available column.

5. Click **Finish**.

The access profile configuration is deleted from the selected device(s).

Juniper Identity Management Service Overview

IN THIS SECTION

- [Access Token Query | 488](#)
- [Batch or Periodic Query | 488](#)
- [IP Address Query | 489](#)
- [User Mapping Query | 489](#)

Juniper Identity Management Service (JIMS) provides a robust and scalable user identification and IP address mapping implementation which includes endpoint context and machine ID. JIMS collects advanced user identities from different authentication sources for SRX Series devices.

Security Director is used to push the JIMS configuration to SRX Series devices. You can use JIMS to obtain IP address or user mapping and device information. SRX Series devices generate the authentication entries for user firewall.

SRX Series devices communicate with JIMS through HTTP or HTTPS connection. Use HTTP connection for debugging and HTTPS for deployments. SRX Series devices consist of primary and secondary JIMS configurations. These devices must always query the primary JIMS. The secondary JIMS is available as a fall back option with limited resources. The secondary JIMS must be used when the HTTP GET query or

number of queries to the primary JIMS fails. SRX Series devices constantly scrutinize the failed primary JIMS and revert to the primary JIMS, once it is up and running.

When you request a JIMS report, the SRX Series device specifies the timestamp. JIMS forms a HTTPS response from the earliest known report since the requested timestamp. SRX Series devices request for the maximum number of reports to include in the response from JIMS. Along with the requested reports, JIMS always returns a cookie. In the subsequent requests to JIMS, SRX Series devices include cookies instead of timestamp to indicate the same context, same beginning timestamp, and to resume the same response from where it has stopped the previous time.

NOTE:

- IP and user mapping information might be inaccurate, if the user identities in JIMS are cleared, delayed, or missing.
- SRX firewall authentication can also push the authentication entries to JIMS.

The SRX Series device communicates with JIMS through HTTP or HTTPS messages to obtain the access token and query for user identities. The following different query modes are available and all queries can happen simultaneously.

Access Token Query

JIMS requires OAuth 2.0 protocol to authenticate or authorize. The SRX Series device user query function requires an access token to query the JIMS server. The SRX Series device uses the client credentials such as client ID and client secret to obtain an access token. These parameters must be consistent with the API client configured on JIMS.

Batch or Periodic Query

At the beginning, SRX Series device sends the batch queries to JIMS sequentially to obtain all the expected user identities. When there are no more entries in JIMS, SRX Series device periodically queries for the newly generated reports with the configured interval.

The timestamp is mentioned in the query to restart the response. The timestamp is expected in the query under the following circumstances:

- SRX Series device queries the JIMS server for the first time
- SRX Series device switches over to the secondary JIMS
- SRX Series device does the error recovery because of an internal error or upon receiving error response from JIMS

For all the other cases, SRX Series device provides the received cookie information in the query instead of a timestamp.

IP Address Query

SRX Series device can provide another query to JIMS specifying the IP address, if it has missed the data for the existing IP address flow. If there are many IP address queries in the queue, SRX Series device can keep multiple concurrent HTTP or HTTPS connections with JIMS to increase the throughput. However, the number of concurrent connections are restricted to less than or equal to 20 connections to reduce the load on JIMS.

User Mapping Query

SRX Series device can engage Captive Portal to obtain the user ID to authenticate the user. Once the user is authenticated, SRX Series device can issue another query to JIMS specifying the user ID and IP address to obtain user information. The firewall authentication uses the

`https://<JIMS>/<query-api>/user/ip=<ip>&id=<id>&domain=<domain>` API to push an authentication success entry to JIMS with the user IP, user ID, and the domain. JIMS responds with the user information.

The difference between the IP address query and user query is that the IP address query does not have the user ID. Both these queries insert the user information to the internal cache of JIMS , and all SRX devices are updated with user information.

Creating Identity Management Profiles

Use the Create Identity Management Profile page to create a JIMS profile and to obtain user identities.

To create an identity management profile:

1. Select **Configure > User Firewall Management > Identity Management Profile**.

The Identity Management Profile page appears.

2. Click the + sign.

The Create Identity Management Profile page appears.

3. Complete the configuration by using the guidelines in [Table 177 on page 491](#).

4. Click **Finish**.

Table 177: Fields on the Create Identity Management Profile Page

Field	Description
<i>General Information</i>	
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. Maximum length is 255 characters.
Description	Enter a description for the identity management profile; maximum length is 255 characters.
<i>General Information—Connection for Primary and Secondary Identity</i>	
Connection Type	<p>Select the application protocol from the list used for the SRX Series device connection to Juniper Identity Management System (JIMS). You identify the connection protocol along with the configuration that identifies JIMS. The user query function allows the SRX Series device to request user authentication and identity information for an individual user from JIMS.</p> <ul style="list-style-type: none"> • HTTP—Protocol that JIMS uses to connect to the SRX Series device. • HTTPS—Secure version of the protocol that JIMS uses to connect to the SRX Series device. <p>If the connection type option is not configured, HTTPS is used by default.</p>
Port	Select the connection port of the JIMS server, from the list. Default port number is 443. The range is 1 to 65535.
Primary IP Address	<p>Enter a valid IPv4 address of the primary JIMS server.</p> <p>SRX Series devices always query the primary JIMS to obtain the user identities.</p>

Table 177: Fields on the Create Identity Management Profile Page (continued)

Field	Description
Primary CA Certificate	<p>Enter the certificate of the primary JIMS server. The SRX Series device uses this certificate to verify the certificate of the JIMS server for the SSL connection that is used for the user query function. For example: <code>'/var/tmp/RADIUSServerCertificate.crt'</code></p> <p>When SRX Series device does not receive the information from JIMS through the Web API POST requests, user query enables the SRX Series device to query JIMS for authentication and identity information for an individual user.</p>
Secondary Identity	Enable this option to use the secondary JIMS server as a fallback when the primary JIMS server fails. By default, this option is disabled.
Secondary IP Address	<p>Enter a valid IPv4 address of the secondary JIMS server.</p> <p>The secondary JIMS is available as a fall back option with limited resources. Use the secondary JIMS when the HTTP GET query or number of queries to the primary JIMS fails.</p>
Secondary CA Certificate	Enter the certificate of the secondary JIMS server. The SRX Series device uses this certificate to verify the JIMS server certificate for the SSL connection, used for the user query function.
Token API	<p>Enter the token API used to generate the URL to acquire an access token. The token API is combined with the connection method and the IP address of JIMS to produce the complete URL used to acquire an access token.</p> <p>For example, if the token API is <code>oauth</code>, the connection method is <code>HTTPS</code>, and the IP address of JIMS is <code>192.0.2.199</code>, the complete URL to acquire an access token would be <code>https://192.0.2.199/api/oauth</code>. This is a required parameter.</p> <p>The default token API is <code>oauth_token/oauth</code>.</p>
Query API	<p>Enter the query API to specify the path of the URL that the SRX Series device uses to query JIMS for an individual user. For the SRX Series device to be able to make a request, you must have configured the query API to obtain an access token.</p> <p>The SRX Series device generates the complete URL for the user query request by combining the query API string with the connection method (<code>HTTP/HTTPS</code>) and the JIMS IP address.</p>
<i>Advanced Settings—Batch Query</i>	
Items per Batch	Enable this option to specify the maximum number of reports to include in the JIMS response. The minimum number of reports is 100.
Query Interval	Enable this option to configure the time interval, in seconds, for SRX Series devices to periodically query JIMS for the newly generated user identities.

Table 177: Fields on the Create Identity Management Profile Page (*continued*)

Field	Description
<i>Advanced Settings—IP Query</i>	
Query Delay Time	<p>Enter the time in seconds for the SRX Series device to delay before sending the individual IP queries to JIMS for authentication and identity information for individual users.</p> <p>After the delay timeout expires, the SRX Series device sends the query to JIMS and creates a pending entry for the user in the Routing Engine authentication table.</p> <p>Range: 0 through 60 seconds</p>
No IP Query	Enable this option to disable the IP address query function that is enabled by default.
<i>Advanced Settings—Authentication Timeout</i>	
Authentication Entry Timeout	<p>Enter the timeout interval after which, the idle entries in the JIMS authentication table expire. If a value of 0 is specified, the entries will never expire. Default is 60 minutes.</p> <p>The timeout interval begins when the user authentication entry is added to the JIMS authentication table.</p>
<i>Assign Devices—Add Assign Devices</i>	
Device Name	Select the SRX Series device from the list for JIMS to send the report on user identities.
Client ID	Enter the client ID that the SRX Series device requires to obtain an access token for the JIMS user query function. The client ID must be consistent with the API client configured on JIMS.
Client Secret	Enter the client secret used with the client ID that the SRX Series device requires to obtain an access token. The client secret must be consistent with the API client configured on JIMS.

Editing, Cloning, and Deleting Identity Management Profiles

IN THIS SECTION

- [Editing Identity Management Profiles | 494](#)
- [Cloning Identity Management Profiles | 494](#)
- [Deleting Identity Management Profiles | 495](#)

You can edit, clone, and delete the identity management profiles from the Identity Management Profiles page. You clone an identity management profile to easily create a identity management profile. You can delete the unused identity management profiles.

Editing Identity Management Profiles

To edit an identity management profile:

1. Select **Configure > User Firewall Management > Identity Management Profile**.

The Identity Management Profile page appears.

2. Select the identity management profile that you want to edit, and click the pencil icon.

The Edit Identity Management Profile page appears, showing the same fields that are displayed when you create an identity management profile.

3. Edit the identity management profile fields as needed.

The changes are saved and you are returned to the Identity Management Profile landing page.

Cloning Identity Management Profiles

To clone an identity management profile:

1. Select **Configure > User Firewall Management > Identity Management Profile**.

The Identity Management Profile page appears.

2. Select the identity management profile that you want to clone, and select **Clone** from the More list or right-click menu..

The Clone Identity Management Profile page appears, showing the same fields that are displayed when you create an identity management profile.

3. Modify the identity management profile fields as needed.

4. Click **OK** to save the changes.

The cloned identity management profile is created and you are returned to the Identity Management Profile page.

Deleting Identity Management Profiles

To delete one or more identity management profiles:

1. Select **Configure > User Firewall Management > Identity Management Profile**.

The Identity Management Profile page appears.

2. Select the identity management profile that you want to delete, and click the **X** icon.

A warning dialog box appears asking you to confirm the deletion.

3. Click **Yes** to delete the selected identity management profiles.

The identity management profiles are deleted and you are returned to the Identity Management Profile page.

Updating the Identity Management Profile to SRX Series Devices

To update the identity management profiles to SRX Series devices:

1. Select **Configure > User Firewall Management > Identity Management Profile**.

The Identity Management Profile page appears.

2. Select the identity management profile that you want to update, and click **Update**.

The Update Identity Management Profile page appears. See [Table 178 on page 496](#) for more details.

3. Select the required SRX Series device to update the identity management profile, and click **Update**.

A new job is created.

4. Click the job ID to see the update status

The Job Management page appears showing the state of the updated job.

Table 178: Fields on the Update Identity Management Profile page

Column Name	Description
Device Name	Name of the SRX Series device.
Configuration	You can view the identity management profile configuration in CLI or XML by clicking View .
Configuration Status	Configuration status of the device. The different configuration states for a SRX Series device are as follows: <ul style="list-style-type: none"> • Synchronizing—During the device update, the status is shown as Synchronizing. • Sync Failed—The synchronization operation failed. • In Sync—The synchronization operation completed successfully; Security Director and the device are synchronized.
Connection Status	Connection status of the device. The status shows either UP or Down.
Domain	Domain of the user.
Device IP	IP address of the device.
Platform	Platform of the device. For example, SRX Series, vSRX.
OS Version	Junos OS version running on the device.

User Firewall Management-End User Profile

IN THIS CHAPTER

- End User Profile Overview | 498
- About the End User Profile Page | 499
- Creating an End User Profile | 500
- Editing and Deleting End User Profile | 502
- End User Profile Operations | 503

End User Profile Overview

An end user profile is a device identity profile. It is a collection of attributes that are characteristics of a specific group of devices, or of a specific device, depending on the attributes configured in the profile. The Packet Forwarding Engine of the SRX Series device maps the IP address of a device to the device identity profile. This feature supports Microsoft Windows Active Directory and third-party network access control (NAC) systems as authentication sources.

When traffic from device A arrives at an SRX Series device, the SRX Series device obtains the IP address of device A from the first traffic packet and uses it to search the device identity authentication table for a matching device identity entry. Then it matches that device identity profile with a security policy whose End User Profile field specifies the device identity profile name. If a match is found, the security policy is applied to traffic issuing from device A.

The same device identity profile can also apply to other devices sharing the same attributes. However, to apply the same security policy, the device and its traffic must match all other fields in the security policy.

A device identity profile must contain a domain name. It might contain more than one set of attributes, but it must contain at least one value in each attribute.

The end user profile feature is useful when you cannot or do not want to use user identity to control access to network resources. The device identity feature allows you to use the identity of a device and its attributes to control access to network resources instead of the identity of the user of that device. You might want to control network access based on the device identity for various reasons. For example, you might allow users to use their own devices (BYOD) to access network resources and you do not want to use captive

portal authentication. Also, some companies might have older switches that do not support 802.1, or they might not have a NAC system.

About the End User Profile Page

To access this page, select **Configure > User Firewall Management > End User Profile**.

Use the End User Profile page to create an end user profile by specifying the name of the profile, one or more of its attributes, and the name of the active directory domain to which the SRX Series device belongs.

NOTE: It is mandatory to specify the device attributes and the domain that the device belongs to.

Tasks You Can Perform

You can perform the following tasks from this page:

- Create an end user profile. See [“Creating an End User Profile” on page 500](#).
- Edit and delete an end user profile. See [“Editing and Deleting End User Profile” on page 502](#).
- Clone, view details, and find policies that use a specific end user profile. See [“End User Profile Operations” on page 503](#).

Field Descriptions

[Table 179 on page 500](#) provides guidelines on using the fields on the End User Profile page.

Table 179: Fields on the End User Profile Page

Field	Description
Name	Specifies the name of the end user profile.
Device Domain	Specifies the name of the domain to which the device belongs; for example, domain1.
Attributes	Specifies one or more values for predefined attributes, such as name, category, manufacturer, type, operating system, and version of the operating system. You can create custom attributes as well.
Description	Specifies a description for the end user profile.
Domain	Specifies the domain of the user.

Creating an End User Profile

Use the Create End User Profile page to create an end user profile. You can apply the end user profile to the firewall policy rules.

To create an end user profile:

1. Select **Configure > User Firewall Management > End User Profile**.

The End User Profile page is displayed.

2. Click the + icon.

The Create End User Profile page is displayed.

3. Complete the configuration according to the guidelines provided in [Table 180 on page 501](#).
4. Click **OK** to create an end user profile or **Cancel** to discard the profile.

An end user profile is created in the End User Profile page. While creating firewall policy rules, you can select an end user profile. When traffic arrives from a device, it matches that device identity profile with a security policy whose End User Profile field specifies the device identity profile name. If a match is found, the security policy is applied to traffic issuing from the device.

Table 180: Fields on the Create End User Profile Page

Field	Description
Name	Enter a unique string of alphanumeric characters, dashes, and underscores. No spaces are allowed. Maximum length is 64 characters.
Description	Enter a description of the end user profile; maximum length is 1024 characters.
Device Domain	Enter a device domain name to which the SRX Series device belongs, using a string of alphanumeric characters, dashes, and underscores.
<i>Add Attributes</i>	
	<p>Click the + icon.</p> <p>The Add Attributes page is displayed. Use this page to add a predefined attribute or create a custom attribute. You can specify one or more values to an attribute and click OK.</p> <p>To edit the attributes, click the pencil icon and edit the details.</p>
Attribute Type	<p>Select an attribute, either predefined or custom.</p> <p>Click Create to create a custom attribute.</p>
Attribute Value	<p>Enter one or more values to the attribute, separated by commas. Attribute value must be a string consisting of letters, numbers, dashes, underscores, and dots. Maximum length is 64 characters.</p> <p>Maximum attribute values allowed for an attribute-type are 20. Each value should be less than 64 characters.</p> <p>The maximum attribute values per profile are 100.</p>
<i>Create New Attribute Type</i>	
	<p>In the Add Attribute page, click Create to create unique custom attribute types.</p> <p>The Create New Attribute Type page is displayed.</p>

Table 180: Fields on the Create End User Profile Page (*continued*)

Field	Description
Attribute Type	Enter a unique attribute type name. It can be a string of alphanumeric characters, dashes, and underscores. No spaces are allowed. Maximum length is 64 characters.

Editing and Deleting End User Profile

You can edit an end user profile and delete an unused profile.

Editing End User Profile

To edit an end user profile:

1. Select **Configure > User Firewall Management > End User Profile**.

The End User Profile page is displayed.

2. Select a profile that you want to edit and click the pencil icon.

The Edit End User Profile page is displayed, showing the same options as when creating a new end user profile.

3. Edit the details and click **OK** to save your changes.

Deleting End User Profile

To delete an end user profile:

1. Select **Configure > User Firewall Management > End User Profile**.

The End User Profile page is displayed.

2. Select a profile and click **X** icon.

A confirmation message appears to verify that you want to delete your selection.

3. Click **Yes** to delete your selection.

Understanding IPS Policies

An Intrusion prevention system (IPS) policy enables you to selectively enforce various attack detection and prevention techniques on network traffic passing through an IPS-enabled device. There are two types of policy options:

- **Group Policy**—select this option, when you want to push a configuration to a group of devices. You can create rules for a group policy.

During a device assignment for a group policy, only devices from the current and child domains (with view parent enabled) are listed. Devices in the child domain with view parent disabled are not listed. Not all the group policies of the Global domain are visible in the child domain. Group policies of the Global domain (including All device policy) are not visible to the child domain, if the view parent of that child domain is disabled. Only the group policies of the Global domain, which has devices from the child domain assigned to it, are visible in the child domain. If there is a group policy in global domain with devices from both D1 and the Global domains assigned to it, only this group policy of the Global domain is visible in the D1 domain along with only the D1 domain devices. No other devices, that is the Device-Exception policy, of the Global domain is visible in the D1 domain.

You cannot edit a group policy of the Global domain from the child domain. This is true for All Devices policy as well. Modifying the policy, deletion of the policy, managing a snapshot, snapshot policy and acquiring the policy lock is also not allowed. Similarly, you cannot perform these actions on the Device-Exception policy of the D1 domain from the Global domain. You can prioritize group policies from the current domain. Group policies from the other domains are not listed.

- **Device Policy**—Select this option, when you want to push a unique IPS policy configuration per device. You can create device rules for a device IPS policy.

Security Director views a logical system like it does any other security device, and it takes ownership of the security configuration of the logical system. In Security Director, each logical system is managed as a unique security device.

During a device assignment for a device policy, only devices from the current domain are listed.

NOTE: If Security Director discovers the root logical system, the root lsys discovers all other user lsys inside the device.

An IPS policy consists of rulebases and each rulebase contains a set of rules. It allows you to define policy rules to match a section of traffic based on a zone, network, and application, and then take active or passive preventive actions on that traffic.

An IPS rulebase protects your network from attacks by using attack objects to detect known and unknown attacks. It detects attacks based on stateful signature and protocol anomalies.

An exempt rulebase works in conjunction with the IPS rulebase. You must have rules in the IPS rulebase before you can create exempt rules. If traffic matches a rule in the IPS rulebase, the IPS policy attempts to match the traffic against the exempt rulebase before performing the specified action or creating a log record for the event. If the IPS policy detects traffic that matches the source or destination pair and the attack objects specified in the exempt rulebase, it automatically exempts that traffic from attack detection.

Configure an exempt rulebase in the following conditions:

- When an IPS rule uses an attack object group that contains one or more attack objects that produce false positives or irrelevant log records.
- When you want to exclude a specific source, destination, or source-destination pair from matching an IPS rule. This prevents IPS from generating unnecessary alarms.

After you create an IPS policy by adding rules in one or more rulebases, you can publish or update the policy. You can also view a list of security devices with IPS policies assigned to them. This list assists you in viewing the details of all the IPS policies and rules assigned per device.

[Assigning Policies and Profiles to Domains | 531](#)

Creating IPS Policies

Use this page to define how your device handles network traffic and to define policy rules. It allows you to enforce various attack detection and prevention techniques on traffic traversing your network.

Before You Begin

- Read the [“Understanding IPS Policies” on page 506](#) topic.
- Configure network interfaces and security zones.
- Enable intrusion prevention system (IPS) in security policies.
- Review the IPS Policies main page for an understanding of your current data set. See [“IPS Policies Main Page Fields” on page 533](#) for field descriptions.

Configuring IPS Policy Settings

To configure an IPS policy:

1. Select **Configure > IPS Policy > Policies**.
2. Click the + icon.
3. Complete the configuration according to the guidelines provided in the [Table 181 on page 508](#).
4. Click **OK**.

A new IPS policy with your configurations is created. After you create an IPS policy, add rules in one or more rulebases and publish the policy. For more information on the IPS policy rules, see [“Creating IPS Policy Rules” on page 509](#). To enable the IPS policy, apply it to a domain, see [“Assigning Policies and Profiles to Domains” on page 531](#).

Table 181: IPS Policy Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 255 characters.
Description	Enter a description for the IPS policy; maximum length is 2048 characters.
Policy Options	
Configuration Mode	Select Advanced to create a policy that allows you to modify custom IPS rules independent of the predefined template. In addition, you can start with a predefined template that copies the predefined rules to your policy, and then edit or delete the rules as necessary.
Policy Templates	Select the predefined and custom policy templates from the Available column to include in the selected list for grouping all rules.
Type	<p>Select an option either to update a specific firewall policy configuration to a large set of devices or to push a unique firewall policy configuration per device:</p> <ul style="list-style-type: none"> • Group Policy—Use this option when you want to push a configuration to a group of devices. You can create rules for a group policy. • Device Policy—Use this option when you want to push a unique IPS policy configuration per device. You can create device rules for a device IPS policy.
Device Selection	

Table 181: IPS Policy Settings (continued)

Settings	Guidelines
Devices	<p>If you selected device policy template type, then select a device on which the policy will be published.</p> <p>If you selected group policy template type, then select the devices from the Available column to include in the selected list for the group policy that will be published.</p>
Policy Sequence	
Placement	Select an option to display or place the policy you have created before or after the device-specific policies.
Sequence No.	Select this option to specify the policy sequence number. This number identifies the location of your policy in relation to the entire sequence.
Select Policy Sequence	Move and place the policy to your preferred sequence in the list. This helps you to organize your policy in the required sequence.

RELATED DOCUMENTATION

[Understanding IPS Policies | 535](#)

[Deleting and Replacing Policies and Objects | 530](#)

[Editing and Cloning Policies and Objects | 529](#)

Creating IPS Policy Rules

Use this page to create intrusion prevention system (IPS) rules that define actions to be taken when the matching traffic pattern is found. You can add, edit, or delete rules to an IPS policy.

You can use the predefined IPS templates while creating an IPS policy. These templates contain rules that use default actions associated with attack objects. You can customize these templates to work on your network by selecting your own source and destination addresses and choosing IPS actions that reflect your security needs.

IPS rules protect your network from attacks by using attack objects to detect known and unknown attacks based on stateful signature and protocol anomalies. IPS exempt rules prevent unnecessary alarms from being generated.

Before You Begin

- Read the [“Understanding IPS Policies” on page 535](#) topic.
- Read the [“Understanding IPS Policy Templates” on page 556](#) topic.
- Create IPS policies and IPS policy templates. See [“Creating IPS Policies” on page 507](#) and [“Creating IPS Policy Templates” on page 557](#).

Configuring IPS Policy Rule Settings

To configure an IPS policy rule:

1. Select **Configure > IPS Policy > Policies > or Templates**.
2. Click the **Add Rules** link in the created policy.
3. Click **Create** and then select **IPS Rule or Exempt Rule**.
4. Complete the configuration according to the guidelines provided in [Table 182 on page 510](#) and [Table 183 on page 516](#).
5. Click **Publish**.

A new IPS rule with your configuration is created. You can use this rule in an IPS policy or an IPS policy template.

Table 182: IPS Policy Rule Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 255 characters.
IPS Type	Display the rule of the specified type. For example, IPS, Exempt.
Src. Zone	Click the Source Zone field and configure the source zone editor settings.
Source Zone Editor	
Zone	Select any zone for the source. You can also use zone exceptions to specify unique to zones for each device. Specify any to monitor network traffic originating from any zone. The default value is any.
Src. Address	Click the Source Address field and configure the source address settings.

Table 182: IPS Policy Rule Settings (*continued*)

Settings	Guidelines
Source Address	
Address Selection	Include or exclude addresses from the selected address list for the rule. You can also select to include any of the IP addresses of the source objects.
Addresses	Select one or more available IP addresses from the Available column to include in the selected list for the rule.
Add New Source Address	Click the button to add a new source address.
Dest. Zone	Click the Destination Zone field and configure the destination zone editor settings.
Destination Zone Editor	
Zone	Select any zone for the destination. You can also use zone exceptions to specify unique from zones for each device. Specify any to monitor network traffic to any zone. The default value is any.
Dest. Address	Click the Destination Address field and configure the destination address settings.
Destination Address	
Address Selection	Include or exclude addresses from the selected address list for the rule. You can also select to include any of the IP addresses of the source objects.
Addresses	Select one or more available IP addresses from the Available column to include in the selected list for the policy rule.
Add New Destination Address	Click the button to add a new destination address.
Service	Click the Service field and configure the service editor settings.
Service Editor	

Table 182: IPS Policy Rule Settings (*continued*)

Settings	Guidelines
Services	<p>Select an available services for the policy rule. For example:</p> <ul style="list-style-type: none"> • ftp—FTP allows the sending and receiving of files between machines. • ssh—SSH is a program to log into another computer over a network through strong authentication and secure communications on a channel that is not secure. • Web—Policy allows access to users who have previously been authenticated by Web authentication. • User Firewall—Uses the username and role information to determine whether to permit or deny a user's session or traffic. • Infranet—Pushes the user and role information for all authenticated users from the Access Control Service. <p>The default value is Default. A service in Security Director refers to an application on a device, such as Domain Name System (DNS). Services are based on protocols and ports and when added to a policy can be applied across all devices managed by Security Director.</p>
Add New Service	Click the button to add a new service.
IPS Signature	Click the IPS Signature field and configure the IPS signature settings.
IPS Signature	
IPS Signatures	Select one or more available IPS signatures from the Available column to include in the selected list for the policy rule.
Add New IPS Signature	Click the button to add a new IPS signature.
Action	Click the Action field and configure the action settings.
Action	

Table 182: IPS Policy Rule Settings (*continued*)

Settings	Guidelines
Action	<p>Select an option for the action you want IPS to take when the monitored traffic matches the attack objects specified in the rules:</p> <ul style="list-style-type: none"> • No Action—Does not take action. Use this action when you only want to generate logs for some traffic. • Ignore—Stops scanning traffic for the rest of the connection if an attack match is found. IPS disables the rulebase for the specific connection. NOTE: This action does not mean ignore an attack. • Drop Packet—Drops a matching packet before it can reach its destination but does not close the connection. Use this action to drop packets for attacks in traffic that is prone to spoofing, such as UDP traffic. Dropping a connection for such traffic could result in a denial of service that prevents you from receiving traffic from a legitimate source IP address. • Drop Connection—Drops all packets associated with the connection, preventing traffic for the connection from reaching its destination. Use this action to drop connections for traffic that is not prone to spoofing. • Close Client—Closes the connection and sends an RST packet to the client but not to the server. • Close Server—Closes the connection and sends an RST packet to the server but not to the client. • Close Client and Server—Closes the connection and sends an RST packet to both the client and the server. • Recommended—Gives a list of all attack objects that Juniper Networks considers to be serious threats, organized into categories. For example, severity groups attack objects by the severity assigned to the attack. • Diffserv Marking—Assigns the indicated Differentiated Services code point (DSCP) value to the packet in an attack, then passes the packet on normally. When you select Diffserv Marking, you need to enter code value. <ul style="list-style-type: none"> • Code Point for Diffserv Marking—Enter a code point value. Based on the DSCP value, behavior aggregate classifiers set the forwarding class and loss priority for the traffic deciding the forwarding treatment the traffic receives. <p>NOTE: The DSCP value is not applied to the first packet that is detected as an attack, but is applied to subsequent packets.</p>
Notification Opt.	Click the Notification field and configure the notification settings.
Notification Opt.	

Table 182: IPS Policy Rule Settings (*continued*)

Settings	Guidelines
Attack Logging	Enable this option to log attacks.
Alert Flag	Enable this option to add an alert flag to an attack log.
Log Packets	Enable this option to log packet capture when a rule matches.
Packets Before	Enter the number of packets processed before the attack is captured.
Packets After	Enter the number of packets processed after the attack is captured.
Post Window Timeout	<p>Enter the time limit for capturing post-attack packets for a session.</p> <p>No packet capture is conducted after the timeout has expired. Range is from 0 through 1800 seconds.</p>
IP Action Opt.	Click the IP Action field and configure the IP action settings.
IP Action Opt.	
IP Action	<p>Select an option to apply actions on future connections that use the same IP action attributes:</p> <ul style="list-style-type: none"> • None—Does not take any action against future traffic. • IP Notify—Does not take any action against future traffic but logs the event. This is the default. • IP Close—Closes any new sessions matching this IP action rule by sending RST packets to the client and server. • IP Block—All packets of any session matching the IP action rule are dropped silently. <p>When traffic matches multiple rules, the most severe IP action of all matched rules is applied. The most severe IP action is the Close Session action, the next in severity is the Drop/Block Session action, and then the Notify action.</p>

Table 182: IPS Policy Rule Settings (*continued*)

Settings	Guidelines
IP Target	<p>Select an option to block future connections:</p> <ul style="list-style-type: none"> • None—Does not match any traffic. • Destination Address—Matches traffic based on the destination address of the attack traffic. • Service—For TCP and UDP, matches traffic based on the source address, source port, destination address, and destination port of the attack traffic. This is the default. • Source Address—Matches traffic based on the source address of the attack traffic. • Source Zone—Matches traffic based on the source zone of the attack traffic. • Source Zone Address—Matches traffic based on the source zone and source address of the attack traffic. • Zone Service—Matches traffic based on the source zone, destination address, destination port, and protocol of the attack traffic.
Refresh Timeout	<p>Enable this option to refresh the IP action timeout so it does not expire when future connections match the IP action filter.</p>
Timeout Value	<p>Enter the number of seconds that you want the IP action to remain in effect after a traffic match.</p> <p>Default value is 0 seconds and the range is from 0 through 64,800 seconds.</p>
Log Taken	<p>Enable this option to log information about the IP action against the traffic that matches a rule.</p>
Log Creation	<p>Enable this option to generate a log event on the IP action filter.</p>
Additional Opt.	<p>Click the Additional field and configure the additional settings.</p>
Additional Opt.	
Severity	<p>Select a severity level to override the inherited attack severity in the rules. Levels, in order of increasing severity, are info, warning, minor, major, and critical. The most dangerous level is critical, which attempts to crash your server or gain control of your network. Informational is the least dangerous level and is used by network administrators to discover holes in their security systems.</p>
Terminal	<p>Enable this option to set a terminal rule flag. The device stops matching rules for a session when a terminal rule is matched.</p>
Description	<p>Enter a description for the IPS policy rule; maximum length is 4096 characters.</p>

Table 183: IPS Policy Templates Rule Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
IPS Type	Display the rule of the specified type. For example, IPS, Exempt.
IPS Signature	Click the IPS Signature field and configure the IPS signature settings.
IPS Signature	
IPS Signatures	Select one or more available IPS signatures from the Available column to include in the selected list for the policy rule.
Add New IPS Signature	Click the button to add a new IPS signature.
Action	Click the Action field and configure the action settings.
Action	

Table 183: IPS Policy Templates Rule Settings (*continued*)

Settings	Guidelines
Action	<p>Select an option for the action you want IPS to take when the monitored traffic matches the attack objects specified in the rules:</p> <ul style="list-style-type: none"> • No Action—Does not take action. Use this action when you only want to generate logs for some traffic. • Ignore—Stops scanning traffic for the rest of the connection if an attack match is found. IPS disables the rulebase for the specific connection. <p>NOTE: This action does not mean ignore an attack.</p> <ul style="list-style-type: none"> • Drop Packet—Drops a matching packet before it can reach its destination but does not close the connection. Use this action to drop packets for attacks in traffic that is prone to spoofing, such as UDP traffic. Dropping a connection for such traffic could result in a denial of service that prevents you from receiving traffic from a legitimate source IP address. • Drop Connection—Drops all packets associated with the connection, preventing traffic for the connection from reaching its destination. Use this action to drop connections for traffic that is not prone to spoofing. • Close Client—Closes the connection and sends an RST packet to the client but not to the server. • Close Server—Closes the connection and sends an RST packet to the server but not to the client. • Close Client and Server—Closes the connection and sends an RST packet to both the client and the server. • Recommended—Gives a list of all attack objects that Juniper Networks considers to be serious threats, organized into categories. For example, severity groups attack objects by the severity assigned to the attack. • Diffserv Marking—Assigns the indicated Differentiated Services code point (DSCP) value to the packet in an attack, then passes the packet on normally. <p>When you select Diffserv Marking, you need to enter code value.</p> <ul style="list-style-type: none"> • Code Point for Diffserv Marking—Enter a code point value. Based on the DSCP value, behavior aggregate classifiers set the forwarding class and loss priority for the traffic deciding the forwarding treatment the traffic receives. <p>NOTE: The DSCP value is not applied to the first packet that is detected as an attack, but is applied to subsequent packets.</p>
Notification Opt.	Click the Notification field and configure the notification settings.
Notification Opt.	
Attack Logging	Enable this option to log attacks.

Table 183: IPS Policy Templates Rule Settings (*continued*)

Settings	Guidelines
Alert Flag	Enable this option to add an alert flag to an attack log.
Log Packets	Enable this option to log packet capture when a rule matches.
Packets Before	Enter the number of packets processed before the attack is captured.
Packets After	Enter the number of packets processed after the attack is captured.
Post Window Timeout	<p>Enter the time limit for capturing post-attack packets for a session.</p> <p>No packet capture is conducted after the timeout has expired. Range is from 0 through 1800 seconds.</p>
IP Action Opt.	Click the IP Action field and configure the IP action settings.
IP Action Opt.	
IP Action	<p>Select an option to apply actions on future connections that use the same IP action attributes:</p> <ul style="list-style-type: none"> • None—Does not take any action against future traffic. • IP Notify—Does not take any action against future traffic but logs the event. This is the default. • IP Close—Closes any new sessions matching this IP action rule by sending RST packets to the client and server. • IP Block—All packets of any session matching the IP action rule are dropped silently. <p>When traffic matches multiple rules, the most severe IP action of all matched rules is applied. The most severe IP action is the Close Session action, the next in severity is the Drop/Block Session action, and then the Notify action.</p>
IP Target	<p>Select an option to block future connections:</p> <ul style="list-style-type: none"> • None—Does not match any traffic. • Destination Address—Matches traffic based on the destination address of the attack traffic. • Service—For TCP and UDP, matches traffic based on the source address, source port, destination address, and destination port of the attack traffic. This is the default. • Source Address—Matches traffic based on the source address of the attack traffic. • Source Zone—Matches traffic based on the source zone of the attack traffic. • Source Zone Address—Matches traffic based on the source zone and source address of the attack traffic. • Zone Service—Matches traffic based on the source zone, destination address, destination port, and protocol of the attack traffic.

Table 183: IPS Policy Templates Rule Settings (*continued*)

Settings	Guidelines
Refresh Timeout	Enable this option to refresh the IP action timeout so it does not expire when future connections match the IP action filter.
Timeout Value	Enter the number of seconds that you want the IP action to remain in effect after a traffic match. Default value is 0 seconds and the range is from 0 through 64,800 seconds.
Log Taken	Enable this option to log information about the IP action against the traffic that matches a rule.
Log Creation	Enable this option to generate a log event on the IP action filter.
Additional Opt.	Click the Additional field and configure the additional settings.
Additional Opt.	
Severity	Select a severity level to override the inherited attack severity in the rules. Levels, in order of increasing severity, are info, warning, minor, major, and critical. The most dangerous level is critical, which attempts to crash your server or gain control of your network. Informational is the least dangerous level and is used by network administrators to discover holes in their security systems.
Terminal	Enable this option to set a terminal rule flag. The device stops matching rules for a session when a terminal rule is matched.
Description	Enter a description for the IPS policy rule; maximum length is 1024 characters.

Publishing Policies

When you publish rules, the process takes into account the priority and precedence values set on the policy and the order of rules on the device. Rules are published in the order of their priority groups, with prerules in the High priority group publishing first, before prerules in the Medium and Low priority groups.

If you change the priority or precedence of a published policy, the policy must be republished for the changes to take effect. Sometimes, changing priority or precedence in one policy can affect other policies in the same priority group. However, such policies do not need to be republished in order for their changes in priority or precedence to take effect for the policies that are implicitly changed by the explicit changes to the republished policy.

To publish a policy:

1. Select **Configure > Policy-Name Policy > Policies**.
2. Select the policy that you want to publish and click **Publish**. The Publish Policy page appears.
3. Select the check boxes next to the devices to which the policy changes will be published.

NOTE: You can search for a specific device on which the policy is published by entering the search criteria in the search field. You can search the devices by their name and IP address.

4. Select **Schedule** at a later time if you want to schedule and publish the configuration later.
5. Select **Run now** if you want to apply the configuration immediately.
6. Click **Publish**. The Affected Devices page displays the devices on which the policies will be published.

Assigning Devices to Policies

Once you create a group or device policy, you can assign devices to it.

To assign devices to a policy:

1. Select **Configure >Policy-Name Policy > Policies**.

The Policies landing page appears.

2. Right-click the policy to which you want to assign devices, or select **Assign Devices** from the More menu.

The Assign Devices page appears. The Name field shows the name of the selected policy and is not editable.

3. Select the **Show only devices without policy assigned** check box.

Only devices that are not assigned to any policy are displayed in the Device Selection section.

4. Select the devices you want to add to the policy from the Available column and click the right arrow to move these devices to the Selected column.

NOTE: There is an option to search for devices in the Selected column on the Assign Devices page. By default, all selected devices are sorted in a list and you can search for devices again, if required.

5. Click **OK** to assign the selected devices to the selected policy.

NOTE: If you do not have permission to certain devices, those devices are not visible while assigning devices to a new or existing policy.

Creating and Managing Policy Versions

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

You create a policy version by taking a snapshot of another policy. You can create versions for all types of policies including All Devices, Group, Device, and Device exceptions.

The maximum number of versions maintained for any policy is 60. If the maximum limit is reached, you must delete the unwanted versions before saving a new version. Versioning and rollback are independent operations for each policy.

For example, if you take a snapshot of a group firewall policy, or roll back to a previous firewall policy version, it does not change the version for all device policy rules; you must separately version each policy rule.

Creating Policy Snapshots

To create a policy version:

1. Select **Configure** and select the landing page for the type of policy for which you are creating a snapshot.
2. From the landing page, select the check box next to the policy for which you are taking a snapshot, and then right-click the policy or click **More**.

A list of actions appears.

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Click **Create Snapshot**.

The Snapshot Policy page appears.

5. Enter your comments in the Comments field, and click Create to take a snapshot. The Snapshot Policy window appears, showing the status of the version as it is created.

NOTE: During policy publish, Security Director takes an automatic snapshot of the policy.

Managing Policy Versions

You can view or manage all available versions of a selected policy. You can perform the following tasks on the snapshots:

- Roll back to a specific version.
- View the differences between any two versions (including the current version) of the policy.
- Delete one or more versions from the system.

Rolling Back Policy Versions

To roll back the selected version so it becomes the current version:

1. Select **Configure** and select the landing page for the type of policy for which you are rolling back the policy version.
2. From the landing page, select the check box next to the policy for which you are rolling back a version, and then right-click the policy or click **More**.

A list of actions appears.

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Select the version that you want to make as the current version, and click **Rollback**.

The rollback operation replaces all the rules and rule groups of the current version with rules and rule groups from the selected version. For all the shared objects, Object Conflict Resolution (OCR) is done. If there are any conflicts between the versioned data and the current objects in the system, the OCR window is displayed.

5. After finishing any conflict resolution, click **Next** to view the OCR summary report.
6. Click **Finish** to replace the current policy with the versioned data. A summary of the snapshot policy is shown by clicking **Snapshot**.

Comparing Policy Versions

To compare two different versions of a policy:

1. Select **Configure** and select the landing page for the type of policy for which you are comparing versions.
2. From the landing page, select the check box next to the policy for which you want to compare versions, and then right-click the policy or click **More**.

A list of actions appears

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Select the versions to be compared, and click **Compare**. You can only compare two versions at a time.

The Compare Versions page appears.

5. Click **Compare** to view the results.

A Compare Versions results window appears showing the differences between the selected versions.

The Compare Versions results window has the following sections:

- Policy Property Changes—hows policy changes for the modified rules.
- Rule Changes—Displays rules that are added, modified, or deleted.
- Column Changes—Shows the differences between the column content for modified rules.

Deleting Policy Versions

To delete a policy version:

1. Select **Configure** and select the landing page for the type of policy for which you are deleting a version.

2. From the landing page, right-click the policy or profile or click **More**.

A list of actions appears.

3. Click **Manage/Rollback**.

The Manage Version page appears.

4. Select the policy version you want to delete and click **Delete**.

A warning message is displayed.

5. Click **Yes** to confirm the deletion.

The selected policy version is deleted.

Creating Rule Name Template

Rule name template provides a mechanism to control the rule name generation based on the rule name template. You can use the rule name templates for all types of rules in Firewall, NAT, and IPS policies.

NOTE: Rule name template builder should be enabled from global domain only and the setting is applicable for all firewall policies in Security Director irrespective of domains.

To create a rule name template for policies:

1. Select **Configure > Policies**.

The Policies page appears.

2. Right-click the policy you want to take a snapshot, or select **Rule Name Template Builder** from the More list.

3. The Rule Name Template Builder page appears.

Select the **Enable** check box to use the rule name template.

4. Select the compliance mode.

- a. Strict Mode—Warns the user with an error message.
- b. Weak Mode—Warns the user with a warning message.

5. Click the plus sign (+) to add a new template builder name.

You can define a template for a new or cloned rule with the following variables:

- Action
- Constant String
- Custom String
- Date (YYYYMMDD format)
- Date Short
- Egress
- Ingress
- Rule Type
- Time (HHmmss format)

- Time (HHMM format)
- User ID

6. Click **OK** to create a new rule name template.

Exporting Policies

Starting in Security Director Release 16.1, you can export any policies (firewall, IPS, or NAT) in a PDF or ZIP file from their respective Policies landing page.

NOTE: Policies can either be exported as PDF or ZIP file. The policies exported as ZIP file are in XML format.

To export a policy to PDF:

1. Select **Configure >Policy-Name Policy > Policies**.

The Policies landing page appears.

2. Right-click the policy you want to export or select **Export Policy to PDF** from the More menu.

The Export Policy to PDF page appears.

3. Click **Export**.

The selected policy details are exported into a PDF file.

To export policy details to a ZIP file:

1. Select **Configure >Policy-Name Policy > Policies**.

The Policies landing page appears.

2. Right-click the policy you want to export or select **Export Policy to Zip File** from the More menu.

The Export Policy page appears.

3. Click **Export**.

The selected policy details are exported into a ZIP file.

Release History Table

Release	Description
16.1	Starting in Security Director Release 16.1, you can export any policies (firewall, IPS, or NAT) in a PDF or ZIP file from their respective Policies landing page.

Unassigning Devices to Policies

Once you create a device policy, you can remove the assigned device from it. This allows you to add a preferred device at any time to a device policy. This option is not available for a group policy.

To remove an assigned devices from a device policy:

1. Select **Configure >Policy-Name > Policies**.

The Policies landing page appears.

2. Select a device policy and then click **More**.

3. Click **Unassign Devices**.

The Unassign Device page appears with a confirmation message.

You can also right-click a policy and select **Unassign Devices**.

4. Click **Yes**.

The assigned device is removed for the selected device policy.

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared objects:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

RELATED DOCUMENTATION

Assigning Policies and Profiles to Domains

You can assign or reassign policies or profiles to different domains when it is first configured and whenever you want to implement a change. You can assign only one policy or profile at a time. Before assigning a policy or profile to another domain, Security Director checks for the validity of the move. If the move is not acceptable, a warning message appears.

To assign a policy or profile to a domain:

1. Select **Configure** and select the landing page for the type of policy or profile that you are assigning to a domain.

2. From the landing page, right-click the policy or profile or click **More**.

A list of actions appears.

3. Select **Assign <Policy or Profile> to Domain**.

The Assign <Policy or Profile> to Domain page appears.

NOTE: <Policy or Profile> is the name of the policy or profile that you are assigning to a domain.

4. Select the required items to assign to a domain.
5. Enable this option to ignore warning messages, if any.
6. Click **Assign**.

A policy or profile is assigned to a domain.

Viewing Policy and Shared Object Details

On a policy or a shared object landing page, you can get a detailed view of the existing policies or objects. The Detail View page lists all the configured parameters of a policy or an object. The Landing page of a policy or shared object lists only some of the configured parameters and not all. The Detail View option helps you to get a consolidated view of all the configured parameters.

NOTE: The detailed view is in read-only mode; you cannot edit any fields.

To see a detailed view of the policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to see the detailed view for, or select **Detail View** from the More list.

The Detail View page appears showing the configuration information, the user who created that particular policy or shared object, and the last updated information.

You can also get a detailed view by hovering over the name and clicking the Detailed View icon before the policy or shared object name.

IPS Policy-Devices

IN THIS CHAPTER

- Understanding IPS Policies | 535
- Devices with IPS Policies Main Page Fields | 536

Understanding IPS Policies

An Intrusion prevention system (IPS) policy enables you to selectively enforce various attack detection and prevention techniques on network traffic passing through an IPS-enabled device. There are two types of policy options:

- **Group Policy**—select this option, when you want to push a configuration to a group of devices. You can create rules for a group policy.

During a device assignment for a group policy, only devices from the current and child domains (with view parent enabled) are listed. Devices in the child domain with view parent disabled are not listed. Not all the group policies of the Global domain are visible in the child domain. Group policies of the Global domain (including All device policy) are not visible to the child domain, if the view parent of that child domain is disabled. Only the group policies of the Global domain, which has devices from the child domain assigned to it, are visible in the child domain. If there is a group policy in global domain with devices from both D1 and the Global domains assigned to it, only this group policy of the Global domain is visible in the D1 domain along with only the D1 domain devices. No other devices, that is the Device-Exception policy, of the Global domain is visible in the D1 domain.

You cannot edit a group policy of the Global domain from the child domain. This is true for All Devices policy as well. Modifying the policy, deletion of the policy, managing a snapshot, snapshot policy and acquiring the policy lock is also not allowed. Similarly, you cannot perform these actions on the Device-Exception policy of the D1 domain from the Global domain. You can prioritize group policies from the current domain. Group policies from the other domains are not listed.

- **Device Policy**—Select this option, when you want to push a unique IPS policy configuration per device. You can create device rules for a device IPS policy.

Security Director views a logical system like it does any other security device, and it takes ownership of the security configuration of the logical system. In Security Director, each logical system is managed as a unique security device.

During a device assignment for a device policy, only devices from the current domain are listed.

NOTE: If Security Director discovers the root logical system, the root lsys discovers all other user lsys inside the device.

An IPS policy consists of rulebases and each rulebase contains a set of rules. It allows you to define policy rules to match a section of traffic based on a zone, network, and application, and then take active or passive preventive actions on that traffic.

An IPS rulebase protects your network from attacks by using attack objects to detect known and unknown attacks. It detects attacks based on stateful signature and protocol anomalies.

An exempt rulebase works in conjunction with the IPS rulebase. You must have rules in the IPS rulebase before you can create exempt rules. If traffic matches a rule in the IPS rulebase, the IPS policy attempts to match the traffic against the exempt rulebase before performing the specified action or creating a log record for the event. If the IPS policy detects traffic that matches the source or destination pair and the attack objects specified in the exempt rulebase, it automatically exempts that traffic from attack detection.

Configure an exempt rulebase in the following conditions:

- When an IPS rule uses an attack object group that contains one or more attack objects that produce false positives or irrelevant log records.
- When you want to exclude a specific source, destination, or source-destination pair from matching an IPS rule. This prevents IPS from generating unnecessary alarms.

After you create an IPS policy by adding rules in one or more rulebases, you can publish or update the policy. You can also view a list of security devices with IPS policies assigned to them. This list assists you in viewing the details of all the IPS policies and rules assigned per device.

Understanding IPS Signatures

The intrusion prevention system (IPS) compares traffic against signatures of known threats and blocks traffic when a threat is detected. Network intrusions are attacks on, or other misuses of, network resources. To detect such activity, IPS uses signatures. A signature specifies the types of network intrusions that you want the device to detect and report. Whenever a matching traffic pattern to a signature is found, IPS triggers the alarm and blocks the traffic from reaching its destination. The signature database is one of the major components of IPS. It contains definitions of different objects, such as attack objects, application signature objects, and service objects, which are used in defining IPS policy rules.

To keep IPS policies organized and manageable, attack objects can be grouped. An attack object group can contain one or more types of attack objects. Junos OS supports the following three types of attack groups:

- **IPS signature**—Contains objects present in the signature database.
- **Dynamic group**—Contains attack objects based on certain matching criteria. During a signature update, dynamic group membership is automatically updated based on the matching criteria for that group. For example, you can dynamically group the attacks related to a specific application using dynamic attack group filters.
- **Static group**—Contains a list of attacks that are specified in the attack definition.

Signature attack objects use a stateful attack signature (a pattern that always exists within a specific section of the attack) to detect known attacks. They also include:

- The protocol or service used to perpetrate the attack and the context in which the attack occurs.
- The properties that are specific to signature attacks—attack context, attack direction, attack pattern, and protocol-specific parameters (TCP, UDP, ICMP, or IP header fields).

Signatures can produce false positives, because certain normal network activity can be construed as malicious. For example, some network applications or operating systems send out numerous ICMP messages, which a signature-based detection system might interpret as an attempt by an attacker to map out a network segment. You can minimize false positives by editing your signature parameters (to fine-tune your signatures).

You can create, filter, modify, or delete IPS signatures on the IPS Policy Signatures page in Security Director. You can download and install the signature database to security devices. You can automate the download and install process by scheduling the download and install tasks and configuring these tasks to recur at specific time intervals. This ensures that your signature database is current.

Creating IPS Signatures

Use the Create IPS Signature page to monitor and prevent intrusions. The intrusion prevention system (IPS) compares traffic against signatures of known threats and blocks traffic when a threat is detected.

The signature database is one of the major components of IPS. It contains definitions of different objects, such as attack objects, application signature objects, and service objects, which are used in defining IPS policy rules. There are more than 8,500 signatures for identifying anomalies, attacks, spyware, and applications.

To keep IPS policies organized and manageable, attack objects can be grouped. An attack object group can contain one or more types of attack objects. Junos OS supports the following three types of attack groups:

- IPS signature—Contains objects present in the signature database.
- Dynamic—Contains attack objects based on certain matching criteria.
- Static—Contains customer-defined attack groups and can be configured through the CLI.

Before You Begin

- Read the [“Understanding IPS Signatures” on page 538](#) topic
- Have a basic understanding of what attacks and patterns are.
- Review the IPS policy signatures main page for an understanding of your current data set. See [“IPS Policy Signatures Main Page Fields” on page 554](#) for field descriptions.

Configuring IPS Signatures Settings

To configure an IPS signature:

1. Select **Configure > IPS Policy > Signatures**.
2. Click **Create**.
3. Select **IPS Signature**.
4. Complete the configuration according to the guidelines provided in the [Table 186 on page 540](#).
5. Click **OK**.

A new IPS signature with the predefined configurations is created. You can use this signature in IPS policies.

Table 186: IPS Signatures Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Description	Enter a description for the IPS signature; maximum length is 1024 characters.
Category	Enter a predefined or a new category. Use this category to group the attack objects. Within each category, attack objects are grouped by severity. For example: FTP, TROJAN, SNMP.

Table 186: IPS Signatures Settings (*continued*)

Settings	Guidelines
Action	<p>Select an action you want IPS signature to take when the monitored traffic matches the attack objects specified in the rules:</p> <ul style="list-style-type: none"> • None—No action is taken. Use this action to only generate logs for some traffic. • Close Client & Server—Closes the connection and sends an RST packet to both the client and the server. • Close Client—Closes the connection and sends an RST packet to the client but not to the server. • Close Server—Closes the connection and sends an RST packet to the server but not to the client. • Ignore—Stops scanning traffic for the rest of the connection if an attack match is found. IPS disables the rulebase for the specific connection. • Drop—Drops all packets associated with the connection, preventing traffic for the connection from reaching its destination. Use this action to drop connections for traffic that is not prone to spoofing. • Drop Packet—Drops a matching packet before it can reach its destination but does not close the connection. Use this action to drop packets for attacks in traffic that is prone to spoofing, such as UDP traffic. Dropping a connection for such traffic could result in a denial of service that prevents you from receiving traffic from a legitimate source-IP address.
Keywords	<p>Enter unique identifiers that can be used to search and sort log records. Keywords should related to the attack and the attack object. For example, Amanda Amindexd Remote Overflow.</p>
Severity	<p>Select a severity level for the attack that the signature will report:</p> <ul style="list-style-type: none"> • Critical—Contains attack objects matching exploits that attempt to evade detection, cause a network device to crash, or gain system-level privileges. • Info—Contains attack objects matching normal, harmless traffic containing URLs, DNS lookup failures, SNMP public community strings, and peer-to-peer (P2P) parameters. You can use informational attack objects to obtain information about your network. • Major—Contains attack objects matching exploits that attempt to disrupt a service, gain user-level access to a network device, or activate a Trojan horse previously loaded on a device. • Minor—Contains attack objects matching exploits that detect reconnaissance efforts attempting to access vital information through directory traversal or information leaks. • Warning—Contains attack objects matching exploits that attempt to obtain noncritical information or scan a network with a scanning tool. <p>The most dangerous level is critical, which attempts to crash your server or gain control of your network. Informational is the least dangerous level and is used by network administrators to discover holes in their security systems.</p>
Signature Details	

Table 186: IPS Signatures Settings (*continued*)

Settings	Guidelines
Binding	<p>Select an option to detect the service or protocol that the attack uses to enter your network:</p> <ul style="list-style-type: none"> • IP—Allows IPS to match the signature for a specified IP protocol type. • ICMP—Allows IPS to match the signature for a specified ICMP ID. • TCP—Allows IPS to match the signature for specified TCP port(s). • UDP—Allows IPS to match the signature for specified UDP port(s). • RPC—Allows IPS to match the signature for a specified remote procedure call (RPC) program number. The RPC protocol is used by distributed processing applications to handle interaction between processes remotely. • Service—Allows IPS to match the signature for a specified service. • IPv6 or ICMPv6—Specifies the header match information for the signature attack. You can specify that IPS search a packet for a pattern match for IPv6 and ICMPv6 header information.
Protocol	Enter the name of the network protocol. For example: IGMP, IP-IP.
Next Header	<p>Enter the type of IP protocol for the header that immediately follows the IPv6 header.</p> <p>For example, if the device performs IPsec on exchanged packets, the Next Header value is probably 50 (ESP extension header) or 51 (AH extension header).</p>
Port Range(s)	Enter the port ranges for TCP and UDP protocol types.
Program Number	Enter the program ID for the RPC protocol.
Service	<p>Specify the service that the attack uses to enter your network. You can select the specific service used to perpetrate the attack as the service binding.</p> <p>For example, suppose you select the DISCARD service. Discard protocol is an Application Layer protocol where TCP/9, UDP/9 describes the process for discarding TCP or UDP data sent to port 9.</p>
Time Scope	<p>Select the scope within which the count of an attack occurs:</p> <ul style="list-style-type: none"> • Source IP—Detect attacks from the source address for the specified number of times, regardless of the destination address. • Dest IP—Detect attacks sent to the destination address for the specified number of times, regardless of the source address. • Peer—Detect attacks between source and destination IP addresses of the sessions for the specified number of times.

Table 186: IPS Signatures Settings (*continued*)

Settings	Guidelines
Time Count	<p>Specify the number of times that the attack object must detect an attack within the specified scope before the device considers the attack object to match the attack.</p> <p>The range is from 0 through 4,294,967,295.</p>
Match Assurance	<p>Specify this filter to track attack objects based on the frequency that the attack produces a false positive on your network.</p> <p>Select an option:</p> <ul style="list-style-type: none"> • High—Provides information on the frequently tracked false positive occurrences. • Medium—Provides information on the occasionally tracked false positive occurrences. • Low—Provides information on the rarely tracked false positive occurrences.
Performance Impact	<p>Specify this filter to filter out slow-performing attack objects. You can use this filter to only select the appropriate attacks based on performance impacts.</p> <p>Select an option:</p> <ul style="list-style-type: none"> • High—Add a high performance impact attack object that is vulnerable to an attack. The performance impact of signatures is high7 to high9, where the application identification is slow. • Medium—Add a medium performance impact attack object that is vulnerable to an attack. The performance impact of signatures is medium4 to medium6, where the application identification is normal. • Low—Add a low performance impact attack object that is vulnerable to an attack. The performance impact of signatures is low1 to low3, where the application identification is faster. • Unknown—Set all attack objects to unknown by default. As you fine-tune IPS to your network traffic, you can change this setting to help you track performance impact. The performance impact of signatures is 0 = unknown, where the application identification is also unknown.
Expression	<p>Enter a Boolean expression of attack members used to identify the way attack members should be matched.</p> <p>For example: m01 AND m02, where m01, m02 are the attack members.</p>
Scope	<p>Specify if the attack is matched within a session or across transactions in a session:</p> <ul style="list-style-type: none"> • session—Allows multiple matches for the object within the same session. • transaction—Matches the object across multiple transactions that occur within the same session.
Reset	<p>Enable this option to generate a new log each time an attack is detected within the same session. If this option is not selected, then the attack is logged only once per session.</p>

Table 186: IPS Signatures Settings (*continued*)

Settings	Guidelines
Ordered	<p>Enable this option to create a compound attack object that must match each member signature or protocol anomaly in the order you specify. If you do not specify an order, the compound attack object still must match all members, but the pattern or protocol anomalies can appear in the attack in any order.</p> <p>A compound attack object detects attacks that use multiple methods to exploit a vulnerability.</p>
Add Signature	
Context	<p>Select an option to define the location of the signature.</p> <p>If you know the service and the specific service context, specify that service and then specify the appropriate service contexts.</p> <p>If you know the service, but are unsure of the specific service context, specify one of the general contexts.</p> <p>For example: line—Specify this context to detect a pattern match within a specific line within your network traffic.</p>
Direction	<p>Specify the connection direction of the attack:</p> <ul style="list-style-type: none"> • Client to Server—Detects the attack only in client-to-server traffic. • Server to Client—Detects the attack only in server-to-client traffic. • Any—Detects the attack in either direction. <p>Using a single direction (instead of Any) improves performance, reduces false positives, and increases detection accuracy.</p>
Pattern	<p>Enter a signature pattern of the attack you want to detect. A signature is a pattern that always exists within an attack; if the attack is present, so is the signature.</p> <p>To create the attack pattern, you must first analyze the attack to detect a pattern (such as a segment of code, a URL, or a value in a packet header), and then create a syntactical expression that represents that pattern.</p> <p>For example: Use <code>\[<character-set>\]</code> for case-insensitive matches.</p>
Regex	<p>Enter a regular expression to define rules to match malicious or unwanted behavior over the network.</p> <p>For example: For the syntax <code>\[hello\]</code>, the expected pattern is hello, which is case sensitive.</p> <p>The example matches can be: hElLo, HEllO, and heLLo.</p>

Table 186: IPS Signatures Settings (continued)

Settings	Guidelines
Negated	<p>Select this option to exclude the specified pattern from being matched.</p> <p>Negating a pattern means that the attack is considered matched if the pattern defined in the attack does not match the specified pattern.</p>
Add Anomaly	
Anomaly	<p>Select an option to detect abnormal or ambiguous messages within a connection according to the set of rules for the particular protocol being used.</p> <p>Protocol anomaly detection works by finding deviations from protocol standards, most often defined by RFCs and common RFC extensions.</p>
Direction	<p>Specify the connection direction of the attack:</p> <ul style="list-style-type: none"> • Client to Server—Detects the attack only in client-to-server traffic. • Server to Client—Detects the attack only in server-to-client traffic. • Any—Detects the attack in either direction. <p>Using a single direction (instead of Any) improves performance, reduces false positives, and increases detection accuracy.</p>
Supported Detectors	<p>Click the Supported Detectors link to display a table that shows the device platforms and the version number of the IPS protocol detector currently running on the device.</p> <p>For example:</p> <ul style="list-style-type: none"> • Platform - SRX550 • Detector Version - 9.1.140080400

Creating IPS Signature Static Groups

Use the IPS Signature Static Group page to configure a specific, finite set of attack objects or groups.

Static groups require more maintenance than dynamic groups because you must manually add or remove attack objects in a static group to change its members.

Use an IPS signature static group for the following tasks:

- Group your custom attack objects.
- Dynamic—Contains attack objects based on certain matching criteria.
- Static—Contains customer-defined attack groups and can be configured through the CLI.

Before You Begin

- Read the [“Understanding IPS Signatures” on page 538](#) topic.
- Have a basic understanding of what attacks are.
- Read the Creating IPS Signatures topic. See [“Creating IPS Signatures” on page 539](#).
- Review the IPS signatures main page for an understanding of your current data set. See [“IPS Policy Signatures Main Page Fields” on page 554](#) for field descriptions.

Configuring IPS Signature Static Group Setting

To configure an IPS signature static group:

1. Select **Configure > IPS Policy > Signatures**.
2. Click **Create**.
3. Select **Static Group**.
4. Complete the configuration according to the guidelines provided in the [Table 187 on page 547](#).
5. Click **OK**.

A new IPS signature static group with the predefined configurations is created. You can use this signature in IPS policies.

Table 187: IPS Signature Static Group Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Group Members	<p>Add or delete group members of a static group.</p> <p>Group members include custom groups whose members are predefined attacks, predefined attack groups, custom attacks, or custom dynamic groups.</p> <p>A custom group defines:</p> <ul style="list-style-type: none"> • A specific set of critical attack objects that you know your network is vulnerable against. • A specific set of informational attack objects that you need to stay aware of events on your network.
Add IPS Signatures	
IPS Signatures	Select one or more available IPS signatures to include in a static group.

Creating IPS Signature Dynamic Groups

Use the IPS Signature Dynamic Group page to configure attack objects based on a certain matching criteria. Dynamic group members can be either predefined or custom attack objects. During a signature update, the dynamic group membership is automatically updated based on the matching criteria for that group. For example, you can dynamically group the attacks related to a specific application using the dynamic attack group filters.

NOTE: A dynamic group cannot contain another group (predefined, static, or dynamic). However, you can include a dynamic group as a member of a static group.

You use dynamic groups so that an attack database update automatically populates the group with relevant members. This eliminates the need to review each new signature to determine if you need to use it in your existing security policy.

Before You Begin

- Read the [“Understanding IPS Signatures” on page 538](#) topic.
- Have a basic understanding of what attacks and patterns are.
- Read the Creating IPS Signatures topic. See [“Creating IPS Signatures” on page 539](#).
- Review the IPS signatures main page for an understanding of your current data set. See [“IPS Policy Signatures Main Page Fields” on page 554](#) for field descriptions.

Configuring IPS Signature Dynamic Group Settings

To configure an IPS signature dynamic group:

1. Select **Configure > IPS Policy > Signatures**.
2. Click **Create**.
3. Select **Dynamic Group**.
4. Complete the configuration according to the guidelines provided in the [Table 188 on page 548](#).
5. Click **OK**.

A new IPS signature dynamic group with the predefined configurations is created. You can use this signature in IPS policies.

Table 188: IPS Signature Dynamic Group Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Preview	Preview a list of available signatures based on selected dynamic group filters.

Table 188: IPS Signature Dynamic Group Settings (*continued*)

Settings	Guidelines
Basic	
Recommended	<p>Specify this filter to add recommended Juniper Networks predefined attack objects to the dynamic group, or specify non-recommended attack objects to the dynamic attack group.</p> <p>Specify an option:</p> <ul style="list-style-type: none"> • Yes—Adds predefined attacks recommended by Juniper Networks to the dynamic group. • No—Specifies non-recommended attack objects in the dynamic attack group.
Direction	<p>Specify this filter to add predefined attacks to the dynamic group based on the direction specified in the attacks.</p> <p>Select an option:</p> <ul style="list-style-type: none"> • Any—Monitors traffic from client-to-server or server-to-client. • CTS—Monitors traffic from client-to-server only. Most attacks occur over client-to-server connections. • STC—Monitors traffic from server-to-client only. • Expression—Matches the expression with member name patterns using Boolean operators. A member name is the name of an attack member in an IPS attack: <ul style="list-style-type: none"> • AND—If both member name patterns match, the expression matches. • OR—If either of the member name patterns match, the expression matches. For SRX Series devices, expression and order cannot be configured together. Only one of them can be specified. For example: m01 AND m02, where m01, m02 are the attack members.
Match Assurance	<p>Specify this filter to track attack objects based on the frequency that the attack produces a false positive on your network.</p> <p>Select an option:</p> <ul style="list-style-type: none"> • High—Add a high performance impact attack object that is vulnerable to an attack. The performance impact of signatures is high7 to high9, where the application identification is slow. • Medium—Add a medium performance impact attack object that is vulnerable to an attack. The performance impact of signatures is medium4 to medium6, where the application identification is normal. • Low—Add a low performance impact attack object that is vulnerable to an attack. The performance impact of signatures is low1 to low3, where the application identification is faster. • Unknown—Set all attack objects to unknown by default. As you fine-tune IPS to your network traffic, you can change this setting to help you track performance impact. The performance impact of signatures is 0 = unknown, where the application identification is also unknown.

Table 188: IPS Signature Dynamic Group Settings (*continued*)

Settings	Guidelines
Performance Impact	<p>Specify this filter to filter out slow-performing attack objects. You can use this filter to only select the appropriate attacks based on performance impacts.</p> <p>Select an option:</p> <ul style="list-style-type: none"> • High—Add a high performance impact attack object that is vulnerable to an attack. The performance impact of signatures is high7 to high9, where the application identification is slow. • Medium—Add a medium performance impact attack object that is vulnerable to an attack. The performance impact of signatures is medium4 to medium6, where the application identification is normal. • Low—Add a low performance impact attack object that is vulnerable to an attack. The performance impact of signatures is low1 to low3, where the application identification is faster. • Unknown—Set all attack objects to unknown by default. As you fine-tune IPS to your network traffic, you can change this setting to help you track performance impact. The performance impact of signatures is 0 = unknown, where the application identification is also unknown.
Object Type	<p>Specify this filter to group attack objects by type (anomaly or signature).</p> <p>Select an option:</p> <ul style="list-style-type: none"> • Protocol Anomaly—Detects unknown or sophisticated attacks that violate protocol specifications (RFCs and common RFC extensions). You cannot create new protocol anomalies, but you can configure a new attack object that controls how your device handles a predefined protocol anomaly when detected. • Signature—Detects known attacks using stateful attack signatures. A stateful attack signature is a pattern that always exists within a specific section of the attack. Stateful signature attack objects also include the protocol or service used to perpetrate the attack and the context in which the attack occurs.
Vendor	<p>Specify this filter to add attack objects based on the application that is vulnerable to the attack.</p> <p>Enter a name for the vendor for the dynamic signature. For example: Juniper Networks.</p>
Advanced	
Category	Select one or more available categories to include in a dynamic group.
Service	Select one or more available services to include in a dynamic group.

Table 188: IPS Signature Dynamic Group Settings (continued)

Settings	Guidelines
Severity	<p>Specify a severity filter to add attack objects based on attack severity levels.</p> <p>Select an option:</p> <ul style="list-style-type: none"> • Info—Provides information about activity on the network, such as applications that are running, potential vulnerable software, and best practice violations. Generally, information attacks are not malicious activity. • Major—Provides information of attacks that try to gain user level access to a system to crash a particular service or application. • Critical—Provides information of attacks that try to gain root level access to a system to crash the entire system. • Minor—Provides information of attacks that try to perform information leakage techniques, including those that exploit vulnerabilities to reveal information about the target. • Warning—Issues a warning when attack matches. Warning attacks are attacks that are suspicious in nature, such as scans and other reconnaissance attempts.

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Note: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

Viewing Policy and Shared Object Details

On a policy or a shared object landing page, you can get a detailed view of the existing policies or objects. The Detail View page lists all the configured parameters of a policy or an object. The Landing page of a policy or shared object lists only some of the configured parameters and not all. The Detail View option helps you to get a consolidated view of all the configured parameters.

NOTE: The detailed view is in read-only mode; you cannot edit any fields.

To see a detailed view of the policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to see the detailed view for, or select **Detail View** from the More list.

The Detail View page appears showing the configuration information, the user who created that particular policy or shared object, and the last updated information.

You can also get a detailed view by hovering over the name and clicking the Detailed View icon before the policy or shared object name.

IPS Policy Signatures Main Page Fields

Use the IPS Policy Signatures main page to get an overall, high-level view of your IPS signature settings. You can filter and sort this information to get a better understanding of what you want to configure.

[Table 189 on page 554](#) describes the fields on this page.

Table 189: IPS Policy Signatures Main Page Fields

Field	Description
Name	Name of the IPS signature.
Severity	Severity level of the attack that the signature will report.
Category	Category of the attack objects.
Object Type	Objects that are used in defining IDP policy rules.

Table 189: IPS Policy Signatures Main Page Fields (*continued*)

Field	Description
Recommended	Predefined attacks recommended by Juniper Networks to the dynamic group.
Action	An IPS signature action taken when the monitored traffic matches the attack objects specified in the rules.
Pre-defined/Custom	Detected known attack patterns and protocol anomalies within the network traffic.
Domain	Domain name of security device. This information is auto-populated once you select the device. For example: global, system.

IPS Policy-Templates

IN THIS CHAPTER

- [Understanding IPS Policy Templates | 556](#)
- [Creating IPS Policy Templates | 557](#)
- [Editing and Cloning Policies and Objects | 558](#)
- [Deleting and Replacing Policies and Objects | 559](#)
- [IPS Policy Templates Main Page Fields | 560](#)

Understanding IPS Policy Templates

Juniper Networks provides predefined policy templates that you can use as a starting point for creating your own policies. Each policy template contains rules that use the default actions associated with the attack objects. You can customize these templates to work on your network by selecting your own source and destination addresses and choosing intrusion prevention system (IPS) actions that reflect your security needs. You can modify the template either by using the Advance option in the IPS Policy page or cloning the template.

IPS policies are collections of rules and rulebases. An IPS policy supports two types of rulebases—IPS rulebase and exempt rulebase. A rulebase is an ordered set of rules that use a specific detection method to identify and prevent attacks. When a rule is matched, it means that an attack has been detected in the network traffic, triggering the action for that rule. The IPS system performs the specified action and protects your network from that attack. Each rulebase can have multiple rules—you determine the sequence in which rules are applied to network traffic by placing them in the desired order. Each rulebase in the IPS system uses specific detection methods to identify and prevent attacks. For more information on the IPS policy rulebases, see [“Understanding IPS Policies” on page 506](#).

[Creating IPS Policy Templates | 557](#)

[Creating IPS Policy Rules | 509](#)

[Creating IPS Policies | 507](#)

Creating IPS Policy Templates

Use the IPS Policy Templates page to configure intrusion prevention system (IPS) policy templates. Juniper Networks provides predefined policy templates that you can use as a guideline for creating policies. Each template is set of rules of a specific rulebase type. You can modify the template either by using the Advance option in the IPS Policy page or cloning the template. This approach allows you to make changes to the policy and to avoid future issues due to changes in the policy templates.

Before You Begin

- Read the [“Understanding IPS Policy Templates” on page 556](#) topic.
- Read the [“Understanding IPS Policies” on page 506](#) topic.
- Configure network interfaces.
- Review the IPS policy template main page for an understanding of your current data set. See [“IPS Policy Templates Main Page Fields” on page 560](#) for field descriptions.

Configuring IPS Policy Templates Settings

To configure an IPS policy template:

1. Select **Configure > IPS Policy > Policy Template**.
2. Click **Create**.
3. Complete the configuration according to the guidelines provided in the [Table 190 on page 558](#).
4. Click **OK**.

A new IPS policy template with your configurations is created. After you create the policy template, add rules in one or more rulebases to select that policy template as the active policy template on your policy. See [“Creating IPS Policy Rules” on page 509](#). You can use this policy template in IPS policies. To enable the IPS policy, apply it to a domain; see [“Assigning Policies and Profiles to Domains” on page 531](#).

Table 190: IPS Policy Template Settings

Settings	Guidelines
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 63 characters.
Description	Enter a description for the policy template; maximum length is 1024 characters.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

NAT Overview

Network Address Translation (NAT) is a form of network masquerading where you can hide devices between the zones or interfaces. A trust zone is a segment of the network where security measures are applied. It is usually assigned to the internal LAN. An untrust zone is the Internet. NAT modifies the IP addresses of the packets moving between the trust and untrust zones.

Whenever a packet arrives at the NAT device, the device performs a translation on the packet's IP address by rewriting it with an IP address that was specified for external use. After translation, the packet appears to have originated from the gateway rather than from the original device within the network. This helps you hide internal IP addresses from the other networks and keep your network secure.

Using NAT also allows you to use more internal IP addresses. Because these IP addresses are hidden, there is no risk of conflict with an IP address from a different network. This helps you conserve IP addresses.

Junos Space Security Director supports three types of NAT:

- **Source NAT**--Translates the source IP address of a packet leaving the trust zone (outbound traffic). It translates the traffic originating from the device in the trust zone. Using source NAT, an internal device can access the network by using the IP addresses specified in the NAT policy. The following use cases are supported with IPv6 NAT:
 - Translation from one IPv6 subnet to another IPv6 subnet without Port Address Translation (PAT)
 - Translation from IPv4 addresses to IPv6 prefixes along with IPv4 address translation
 - Translation from IPv6 host(s) to IPv6 host(s) with or without PAT
 - Translation from IPv6 host(s) to IPv4 host(s) with or without PAT
 - Translation from IPv4 host(s) to IPv6 host(s) with or without PAT
- **Destination NAT**--Translates the destination IP address of a packet entering the trust zone (inbound traffic). It translates the traffic originating from a device outside the trust zone. Using destination NAT, an external device can send packets to a hidden internal device. The following use cases are supported with IPv6 NAT:
 - Mapping of one IPv6 subnet to another IPv6 subnet
 - Mapping between one IPv6 host and another IPv6 host
 - Mapping of one IPv6 host (and optional port number) to another special IPv6 host (and optional port number)
 - Mapping of one IPv6 host (and optional port number) to another special IPv4 host (and optional port number)
 - Mapping of one IPv4 host (and optional port number) to another special IPv6 host (and optional port number)

- Static NAT-- Always translates a private IP address to the same public IP address. It translates traffic from both sides of the network (both source and destination). For example, a webserver with a private IP address can access the Internet using a static, one-to-one address translation. The following use cases are supported with IPv6 NAT:
 - Mapping of one IPv6 subnet to another IPv6 subnet
 - Mapping between one IPv6 host and another IPv6 host
 - Mapping between IPv4 address a.b.c.d and IPv6 address Prefix::a.b.c.d
 - Mapping between IPv4 host(s) and IPv6 host(s)
 - Mapping between IPv6 host(s) and IPv4 host(s)

Table 1 shows the persistent NAT support for different source NAT and destination NAT addresses.

Table 192: Persistent NAT Support

Source NAT Address	Translated Address	Destination NAT Address	Persistent NAT
IPv4	IPv6	IPv4	No
IPv4	IPv6	IPv6	No
IPv6	IPv4	IPv4	Yes
IPv6	IPv6	IPv6	No

Table 2 and Table 3 show the translated address pool selection for source NAT, destination NAT, and static NAT addresses.

Table 193: Translated Address Pool Selection for Source NAT

Source NAT Address	Destination Address	Pool Address
IPv4	IPv4	IPv4
IPv4	IPv6 - Subnet must be greater than 96	IPv6
IPv6	IPv4	IPv4
IPv6	IPv6	IPv6

Table 194: Translated Address Pool Selection for Destination NAT And Static NAT

Source NAT Address	Destination Address	Pool Address
IPv4	IPv4	IPv4 or IPv6
IPv4	IPv6 - Subnet must be greater than 96	IPv4 or IPv6
IPv6	IPv4	IPv4
IPv6	IPv6	IPv4 or IPv6

- For source NAT, the proxy NDP is available for NAT pool addresses. For destination NAT and static NAT, the proxy NDP is available for destination NAT addresses.
- A NAT pool can have a single IPv6 subnet or multiple IPv6 hosts.
- You cannot configure the overflow pool if the address type is IPv6.
- NAT pools permit address entries of only one version type: IPv4 or IPv6.

Junos Space Security Director provides you with a workflow where you can create and apply NAT policies on devices in a network.

Security Director views each logical system as any other security device and takes ownership of the security configuration of the logical system. In Security Director, each logical system is managed as a unique security device.

NOTE: If the root logical system is discovered, all other user logical systems inside the device, will also be discovered.

Because an SRX Series logical system device does not support interface NAT, Security Director also does not allow interface NAT configuration of logical system. The logical system cannot participate in group NAT in Security Director. For a device NAT policy, the interface based translation selection and pool with Overflow Pool as interface are not supported in logical systems. The configuration is validated during the publishing of the NAT policy to avoid commit failures in the device.

NAT Global Address Book Overview

IN THIS SECTION

- [Differences Between Global and Zone-Based Address Books | 566](#)

In Junos OS Release 11.2 and later releases, the address book is moved from the zone level to the device global level. This permits objects to be used across many zones and avoids inefficient use of resources. This change also permits nested groups to be configured within the address book, removing redundancy from repeating address objects.

The Security Director application manages its address book at the global level, assigning objects to devices that are required to create policies. If the device is capable of using a global address book, Security Director pushes address objects used in the policies to the device global address book. Nested address group capability is used in the publish and update feature of Security Director depending on the device capability.

Differences Between Global and Zone-Based Address Books

The global address book is supported in Junos OS Release 11.2 and later releases.

- An address book is not configured within a specific zone; therefore, one address book can be associated with multiple zones.
- If a global address book is defined, you cannot create zone-based address books.
- By default, there is an address book called global associated with all zones.
- A zone can be attached to only one address book in addition to the global address book, which contains all zones by default.
- Address name overlaps are possible between the global address book and zone address book. For example, Security Director will attempt to match an address in the zone-based address book first, and, if the address is not found, the global address book is checked. You must ensure that the correct address objects are used in the policy.
- NAT rules can use address objects only from the global address book. They cannot use addresses from user-defined address books.

NOTE: Beginning in Junos OS Release 12.1, zone-based address books are no longer supported. Devices running Junos OS Release 12.1 or later must use the global address book.

NOTE: Beginning in Junos OS Release 11.2, NAT rules can use address objects from the global address book. However, Security Director will still continue to define the NAT address in the rule itself rather than referring to the global address book.

Creating NAT Policies

Use the Network Address Translation (NAT) policy page to perform basic NAT configuration.

NAT is a form of network masquerading where you can hide devices between zones or interfaces. NAT modifies the IP addresses of the packets moving between the trust and untrust zones. A trust zone is a segment of the network where security measures are applied. It is usually assigned to the internal LAN. An untrust zone is the Internet.

Whenever a packet arrives at a NAT device, the device performs a translation on the IP address of the packet by rewriting it with an IP address that was specified for external use. After translation, the packet appears to have originated from the gateway rather than from the original device within the network. This process hides your internal IP addresses from the other networks and keeps your network secure.

Also, NAT permits you to use more internal IP addresses. Because these IP addresses are hidden, there is no risk of conflict with an IP address from a different network. This feature helps you conserve IP addresses.

Before You Begin

- Read the [“NAT Overview” on page 563](#) topic.
- Read the [“NAT Global Address Book Overview” on page 566](#) topic.
- Review the NAT policies main page for an understanding of your current data set. See [“NAT Policies Main Page Fields” on page 588](#) descriptions.

Configuring NAT Policy Settings

To configure a NAT policy:

- Select **Configure > NAT Policy > Policies**.
- Click the plus sign (+) to create a new NAT policy.

- Complete the configuration according to the guidelines provided in [Table 195 on page 568](#).

A new NAT policy is created. After you create an IPS policy, add rules in one or more rulebases to select that policy to be the active policy on your device, see [“Creating NAT Rules” on page 572](#). You can also assign NAT policy to a domain; see [“Assigning Policies and Profiles to Domains” on page 579](#).

Table 195: NAT Policy Settings

Setting	Guideline
Names	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 255 characters.
Description	Enter a description for the NAT policy; maximum length is 255 characters.
<i>Policy Options</i>	
Auto ARP Configuration	Select this option to respond to incoming Address Resolution Protocol (ARP) requests. ARP translates IPv4 addresses to MAC addresses.
Type	Select the type of NAT policy you want to create: <ul style="list-style-type: none"> • Group policy • Device policy
<i>Device Selection</i>	
Device Selection	<p>Select the devices on which the group policy will be published. Select these devices from the Available column and move them to the Selected column.</p> <p>You can also search for the devices in the search field available in both Available and Selected columns. You can search these devices by entering the device name, device IP address, or device tag.</p> <p>NOTE: During a device assignment for a group policy, only devices from the current and child domains (with view parent enabled) are listed. Devices in the child domain with view parent disabled are not listed.</p>
Devices	Select the device on which the device policy will be published. During a device assignment for a device policy, only devices from the current domain are listed.
<i>Policy Sequence</i>	
Policy Placement	Select an option to place the newly created global policy either before the existing device policies or after the device policies. Once you select the policy placement for your global policy, you can choose the sequence number.

Table 195: NAT Policy Settings (*continued*)

Setting	Guideline
Policy Sequence No.	Click Select to reorder your NAT policy among the existing device policies.

RELATED DOCUMENTATION

[NAT Overview | 563](#)
[NAT Global Address Book Overview | 566](#)

Publishing Policies

When you publish rules, the process takes into account the priority and precedence values set on the policy and the order of rules on the device. Rules are published in the order of their priority groups, with prerules in the High priority group publishing first, before prerules in the Medium and Low priority groups.

If you change the priority or precedence of a published policy, the policy must be republished for the changes to take effect. Sometimes, changing priority or precedence in one policy can affect other policies in the same priority group. However, such policies do not need to be republished in order for their changes in priority or precedence to take effect for the policies that are implicitly changed by the explicit changes to the republished policy.

To publish a policy:

1. Select **Configure > Policy-Name Policy > Policies**.
2. Select the policy that you want to publish and click **Publish**. The Publish Policy page appears.
3. Select the check boxes next to the devices to which the policy changes will be published.

NOTE: You can search for a specific device on which the policy is published by entering the search criteria in the search field. You can search the devices by their name and IP address.

4. Select **Schedule** at a later time if you want to schedule and publish the configuration later.

5. Select **Run** now if you want to apply the configuration immediately.
6. Click **Publish**. The Affected Devices page displays the devices on which the policies will be published.

NAT Policy Rules Main Page Field

Use this page to get an overall, high-level view of your NAT policy rules settings. Details help you keep track of the number and order of rules per policy. You can filter and sort this information to get a better understanding of what you want to view. [Table 196 on page 570](#) describes the fields on this page.

Table 196: NAT Policy Rules Main Page Field

Field	Description
Name	Unique name for the rule.
NAT Type	Type of the NAT rule such as source, destination, or static.
Source Ingress	Displays the source ingress type, For example: zone, interface, or routing instance.
Source Address	Displays the source address of the NAT policy.
Source Port	Displays the source port of the NAT policy.
Protocol	Displays the protocol to permit or deny the traffic.
Destination Egress	Displays the destination egress type. For example: zone, interface, or routing interface.
Destination Address	Displays the destination address of the policy.
Destination Port	Displays the destination port of the policy.

Table 196: NAT Policy Rules Main Page Field (*continued*)

Field	Description
Service	Service to permit or deny for the source and destination type NAT rules. This is supported for devices running Junos OS Release 12.1X47.
Translated Packet Source	Source address translated to an IP address for packet matching.
Translated Packet Destination	Destination address translated to an IP address for packet matching.
Description	Description of the NAT rule.

Starting in Junos Space Security Director Release 16.1, the address, service, and NAT pools objects can be created, managed, dragged and dropped to the required rules from the NAT policy rules page. From the Shared Objects list, select **Show Addresses**, **Show Services**, or **Show Pools** to see the required shared objects. To create a new address, service, or NAT pool, click the plus sign (+). You can also modify, delete, and manage these objects. You can search for any object by its name and IP address in the search field available in the top right corner.

You can drag more than one object and drop on the respective columns in the policy tabular view. Security Director ensure that objects are dropped in the supported columns and it does not permit to drop under any other columns. The drag and drop of objects is supported on the Source Address, Destination Address, and Service columns. You can drag source or destination NAT pool and drop into source or destination NAT rule. A single or multiple addresses, services, and NAT pools can be dragged and dropped across rules. To view multiple objects in an address, service, or NAT pool column, click the small horizontal triangle to expand the columns.

Release History Table

Release	Description
16.1	Starting in Junos Space Security Director Release 16.1, the address, service, and NAT pools objects can be created, managed, dragged and dropped to the required rules from the NAT policy rules page.

RELATED DOCUMENTATION

Creating NAT Rules

NAT processing centers on the evaluation of NAT rule sets and rules. A rule set determines the overall direction of the traffic to be processed. Once a rule set that matches the traffic has been found, each rule in the rule set is evaluated in order for a match. NAT rules can match on the following packet information:

- Source and destination address
- Source port (for source and static NAT only)
- Destination port

The first rule in the rule set that matches the traffic is used. If a packet matches a rule in a rule set during session establishment, traffic is processed according to the action specified by that rule.

When you create a new NAT policy, click on the NAT policy name to configure the rules. You can configure the following types of NAT rules:

- Source
- Static
- Destination

Depending on the type of rule you have chosen, some fields in the rule will not be applicable. In addition to defining rules between zones and interfaces, you can define NAT rules with virtual routers defined on the device. These rules can be successfully published and updated on the device.

- Read the [“NAT Overview” on page 563](#) topic.
- Read the [“Creating NAT Policies” on page 567](#) topic.

Configuring NAT Rule Settings

To configure a NAT rule:

1. Select Configure > NAT Policies > Policies.
2. Click the NAT policy name.
The Rules page appears.
3. Add a rule by clicking Create. Select the type of rule you want to add (source, static, or destination).
4. Complete the configuration according to the guidelines provided in Table 1.
5. Click Save.

A new NAT rule is configured for a NAT policy.

Table 197: NAT Rules Settings

Setting	Guideline
Seq.	Displays the sequence number assigned to the NAT rule.
Name	Select the name of the NAT policy that you want to add a rule to.
NAT Type	<p>Select the type of NAT rule:</p> <ul style="list-style-type: none"> • Source • Static • Destination
Source Ingress	<p>Click the Source Ingress field to configure the ingress type.</p> <ul style="list-style-type: none"> • Ingress Type—Select an ingress type: zone, interface, or routing instance. • From the appropriate selector, select the zones, interfaces, or routing instance that you want to associate the rule to, from the Available column. <p>For the Routing Instance option, you can select one or more of the available virtual routers on the device. For the group NAT policy, you will see a consolidated list of all virtual routers on all devices that the policy is assigned to.</p> <ul style="list-style-type: none"> • Click OK.
Source Address	Click the Source Address field to assign the source address for the policy, from the Available list.
Source Port	<p>Click the Source Port field to configure the source port for the policy.</p> <ul style="list-style-type: none"> • Enter a maximum of eight ports and port ranges separated by commas. • Select the required port set from the Available list. <p>Create a source port inline by clicking Add New Source Port.</p>
Protocol	Select the protocol from the Available list to permit or deny traffic.
Destination Egress	<p>Click the Destination Egress field to configure the egress type.</p> <ul style="list-style-type: none"> • Select an egress type: zone, interface, or routing instance. • From the appropriate selector, select the zones, interfaces, or routing instance that you want to associate the rule to, from the Available column. • Click OK.
Destination Address	Click the Destination Address field to assign the destination address for the policy, from the Available list. Create a destination address inline by clicking Add New Destination Address .

Table 197: NAT Rules Settings (*continued*)

Setting	Guideline
Destination Port	<p>Click the Destination Port field to configure the destination port for the policy.</p> <ul style="list-style-type: none"> • Enter a maximum of eight ports and port ranges separated by commas. Devices running Junos OS Release 12.1X47 and later support multiple ports and ranges, in the same way as Source ports. • Select the required port set from the Available list. <p>Create a destination port inline by clicking Add New Source Port.</p>
Service	<p>Select the service to permit or deny for the source and destination type NAT rules. This is supported for devices running Junos OS Release 12.1X47.</p> <ul style="list-style-type: none"> • Select Service—Select one of the following options: <ul style="list-style-type: none"> • None—No translation is required. • Interface—Enable interface NAT with or without port overloading. <ul style="list-style-type: none"> • Persistent—Enable the check box to ensure that all requests from the same internal transport address are mapped to the same reflexive transport address. • Persistent NAT type—Configure persistent NAT mappings. <ul style="list-style-type: none"> • Permit any remote host—All requests from a specific internal IP address and port are mapped to the same reflexive transport address. (The reflexive transport address is the public IP address and port created by the NAT device closest to the STUN server.) Any external host can send a packet to the internal host by sending the packet to the reflexive transport address. • Permit target host—All requests from a specific internal IP address and port are mapped to the same reflexive transport address. An external host can send a packet to an internal host by sending the packet to the reflexive transport address. The internal host must have previously sent a packet to the external host's IP address. • Permit target host port—All requests from a specific internal IP address and port are mapped to the same reflexive transport address. An external host can send a packet to an internal host by sending the packet to the reflexive transport address. The internal host must have previously sent a packet to the external host's IP address and port. • Inactivity timeout—The amount of time, in seconds, that the persistent NAT binding remains in the Juniper Networks device's memory when all the sessions of the binding entry are gone. When the configured timeout is reached, the binding is removed from memory. The range is 60 through 7200 seconds. • Maximum session number—The maximum number of sessions with which a persistent NAT binding can be associated. For example, if the max-session-number of the persistent NAT rule is 65,536, then a 65,537th session cannot be established if that session uses the persistent NAT binding created from the persistent NAT rule. The range is 8 through 65,536. The default is 30 sessions.

Table 197: NAT Rules Settings (*continued*)

Setting	Guideline
Translated Packet Destination	Click Translated Packet Destination . Select the appropriate destination address. This option is available only for the destination NAT rule.
Description	Enter a description for the NAT rule; maximum length is 4096 characters.

Updating Policies on Devices

When you publish rules, the process takes into account the priority and precedence values set on the policy and the order of rules on the device. Rules are published in the order of their priority groups, with prerules in the High priority group publishing first, before prerules in the Medium and Low priority groups.

If you change the priority or precedence of a published policy, the policy must be republished for the changes to take effect. Sometimes, changing priority or precedence in one policy can affect other policies in the same priority group. However, such policies do not need to be republished in order for their changes in priority or precedence to take effect for the policies that are implicitly changed by the explicit changes to the republished policy.

To update a policy:

1. Select **Configure >Policy-Name Policy > Policies**.
2. Select the policy that you want to update and click **Update**. The Update Policy page appears.
3. Select the check boxes next to the devices to which the policy changes will be published.

NOTE: You can search for a specific device on which the policy is published by entering the search criteria in the search field. You can search the devices by their name and IP address.

4. Select **Schedule** at a later time if you want to schedule and publish the configuration later.
5. Select **Run now** if you want to apply the configuration immediately.
6. Click **Publish**. The Affected Devices page displays the devices on which the policies will be published.

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.
The policies or shared objects page appears.
2. Select the policy or shared object that you want to edit, and then click the pencil icon.
The Edit window appears, showing the same options as when creating a new policy or object.
3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

Viewing Policy and Shared Object Details

On a policy or a shared object landing page, you can get a detailed view of the existing policies or objects. The Detail View page lists all the configured parameters of a policy or an object. The Landing page of a policy or shared object lists only some of the configured parameters and not all. The Detail View option helps you to get a consolidated view of all the configured parameters.

NOTE: The detailed view is in read-only mode; you cannot edit any fields.

To see a detailed view of the policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to see the detailed view for, or select **Detail View** from the More list.

The Detail View page appears showing the configuration information, the user who created that particular policy or shared object, and the last updated information.

You can also get a detailed view by hovering over the name and clicking the Detailed View icon before the policy or shared object name.

Assigning Policies and Profiles to Domains

You can assign or reassign policies or profiles to different domains when it is first configured and whenever you want to implement a change. You can assign only one policy or profile at a time. Before assigning a policy or profile to another domain, Security Director checks for the validity of the move. If the move is not acceptable, a warning message appears.

To assign a policy or profile to a domain:

1. Select **Configure** and select the landing page for the type of policy or profile that you are assigning to a domain.

2. From the landing page, right-click the policy or profile or click More.

A list of actions appears.

3. Select Assign <Policy or Profile> to Domain.

The Assign <Policy or Profile> to Domain page appears.

NOTE: <Policy or Profile> is the name of the policy or profile that you are assigning to a domain.

4. Select the required items to assign to a domain.
5. Enable this option to ignore warning messages, if any.
6. Click **Assign**.

A policy or profile is assigned to a domain.

Creating and Managing Policy Versions

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

You create a policy version by taking a snapshot of another policy. You can create versions for all types of policies including All Devices, Group, Device, and Device exceptions.

The maximum number of versions maintained for any policy is 60. If the maximum limit is reached, you must delete the unwanted versions before saving a new version. Versioning and rollback are independent operations for each policy.

For example, if you take a snapshot of a group firewall policy, or roll back to a previous firewall policy version, it does not change the version for all device policy rules; you must separately version each policy rule.

Creating Policy Snapshots

To create a policy version:

1. Select **Configure** and select the landing page for the type of policy for which you are creating a snapshot.
2. From the landing page, select the check box next to the policy for which you are taking a snapshot, and then right-click the policy or click **More**.

A list of actions appears.

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Click **Create Snapshot**.

The Snapshot Policy page appears.

5. Enter your comments in the Comments field, and click Create to take a snapshot. The Snapshot Policy window appears, showing the status of the version as it is created.

NOTE: During policy publish, Security Director takes an automatic snapshot of the policy.

Managing Policy Versions

You can view or manage all available versions of a selected policy. You can perform the following tasks on the snapshots:

- Roll back to a specific version.

- View the differences between any two versions (including the current version) of the policy.
- Delete one or more versions from the system.

Rolling Back Policy Versions

To roll back the selected version so it becomes the current version:

1. Select **Configure** and select the landing page for the type of policy for which you are rolling back the policy version.
2. From the landing page, select the check box next to the policy for which you are rolling back a version, and then right-click the policy or click **More**.

A list of actions appears.

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Select the version that you want to make as the current version, and click **Rollback**.

The rollback operation replaces all the rules and rule groups of the current version with rules and rule groups from the selected version. For all the shared objects, Object Conflict Resolution (OCR) is done. If there are any conflicts between the versioned data and the current objects in the system, the OCR window is displayed.

5. After finishing any conflict resolution, click **Next** to view the OCR summary report.
6. Click **Finish** to replace the current policy with the versioned data. A summary of the snapshot policy is shown by clicking Snapshot.

Comparing Policy Versions

To compare two different versions of a policy:

1. Select **Configure** and select the landing page for the type of policy for which you are comparing versions.
2. From the landing page, select the check box next to the policy for which you want to compare versions, and then right-click the policy or click **More**.

A list of actions appears

3. Select **Manage/Rollback**.

The Manage Version page appears.

4. Select the versions to be compared, and click **Compare**. You can only compare two versions at a time.

The Compare Versions page appears.

5. Click **Compare** to view the results.

A Compare Versions results window appears showing the differences between the selected versions.

The Compare Versions results window has the following sections:

- **Policy Property Changes**—Shows policy changes for the modified rules.
- **Rule Changes**—Displays rules that are added, modified, or deleted.
- **Column Changes**—Shows the differences between the column content for modified rules.

Deleting Policy Versions

To delete a policy version:

- Select **Configure** and select the landing page for the type of policy for which you are deleting a version.
- From the landing page, right-click the policy or profile or click **More**.

A list of actions appears.

- Click **Manage/Rollback**.

The Manage Version page appears.

- Select the policy version you want to delete and click **Delete**.

A warning message is displayed.

- Click **Yes** to confirm the deletion.

The selected policy version is deleted.

Assigning Devices to Policies

Once you create a group or device policy, you can assign devices to it.

To assign devices to a policy:

1. Select **Configure >Policy-Name Policy > Policies**.

The Policies landing page appears.

2. Right-click the policy to which you want to assign devices, or select **Assign Devices** from the More menu.

The Assign Devices page appears. The Name field shows the name of the selected policy and is not editable.

3. Select the Show only devices without policy assigned check box.

Only devices that are not assigned to any policy are displayed in the Device Selection section.

4. Select the devices you want to add to the policy from the Available column and click the right arrow to move these devices to the Selected column.

NOTE: There is an option to search for devices in the Selected column on the Assign Devices page. By default, all selected devices are sorted in a list and you can search for devices again, if required.

5. Click **OK** to assign the selected devices to the selected policy.

NOTE: If you do not have permission to certain devices, those devices are not visible while assigning devices to a new or existing policy.

Unassigning Devices to Policies

Once you create a device policy, you can remove the assigned device from it. This allows you to add a preferred device at any time to a device policy. This option is not available for a group policy.

To remove an assigned devices from a device policy:

1. Select **Configure** > *Policy-Name* > **Policies**.

The Policies landing page appears.

2. Select a device policy and then click **More**.

3. Click **Unassign Devices**

The Unassign Device page appears with a confirmation message.

You can also right-click a policy and select **Unassign Devices**.

4. Click **Yes**.

The assigned device is removed for the selected device policy.

Creating Rule Name Template

Rule name template provides a mechanism to control the rule name generation based on the rule name template. You can use the rule name templates for all types of rules in Firewall, NAT, and IPS policies.

NOTE: Rule name template builder should be enabled from global domain only and the setting is applicable for all firewall policies in Security Director irrespective of domains.

To create a rule name template for policies:

1. Select **Configure > Policies**.

The Policies page appears.

2. Right-click the policy you want to take a snapshot, or select **Rule Name Template Builder** from the More list.

3. The Rule Name Template Builder page appears.

Select the Enable check box to use the rule name template.

4. Select the compliance mode.

- a. Strict Mode—Warns the user with an error message.
- b. Weak Mode—Warns the user with a warning message.

5. Click the plus sign (+) to add a new template builder name.

You can define a template for a new or cloned rule with the following variables:

- Action
- Constant String
- Custom String
- Date (YYYYMMDD format)
- Date Short
- Egress
- Ingress
- Rule Type
- Time (HHmmss format)

- Time (HHMM format)
- User ID

6. Click **OK** to create a new rule name template.

Configuring NAT Rule Sets

A rule set determines the overall direction of the traffic to be processed. For example, a rule set can select traffic from a particular interface or to a specific zone. A rule set can contain multiple rules. Once a rule set is found that matches specific traffic, each rule in the rule set is evaluated for a match. Each rule in the rule set further specifies the traffic to be matched and the action to be taken when traffic matches the rule.

To configure a NAT rule set:

1. Select **Configure > NAT Policy > Policies**.

The NAT Policies page appears.

2. Right-click the NAT policy you want to take a snapshot, or select **Configure Rule Sets** from the More list.

The Configure Rule Sets page appears.

3. Modify the rule set name in the Rule Set column and click **OK** to save the changes.

- [NAT Pools Main Page Fields | 598](#)

Creating NAT Pools

A NAT pool is a set of IP addresses that you can define and use for translation. NAT policies perform address translation by translating internal IP addresses to the addresses in these pools. Unlike static NAT, where there is a one-to-one mapping that includes destination IP address translation in one direction and source IP address translation in the reverse direction, with source NAT, you translate the original source IP address to an IP address in the address pool. With destination NAT, you translate the original destination address to an IP address in the address pool.

NOTE: Do not overlap NAT addresses for source NAT, destination NAT, and static NAT within one routing instance.

Before You Begin

- Read the [“NAT Overview” on page 563](#) topic
- Review the NAT pools main page for an understanding of your current data set. See [“NAT Pools Main Page Fields” on page 598](#) for field descriptions.

Configuring NAT Pool Settings

To configure a NAT pool:

1. Select **Configure > NAT Policy > Pools**.
2. Click the plus sign (+) to create a new NAT pool.
3. Complete the configuration according to the guidelines provided in [Table 200 on page 591](#).
4. Click **OK**.

A new NAT pool with your configurations is created. You can also assign NAT pools to a domain; see [“Assigning Policies and Profiles to Domains” on page 597](#).

Table 200: NAT Pool Settings

Setting	Guideline
<i>General Information</i>	
Name	Enter a unique string of alphanumeric characters, colons, periods, slashes, dashes, and underscores; no spaces allowed; 31-character maximum.
Description	Enter a description for the new NAT pool; maximum length is 255 characters.
Pool Type	Select a NAT pool type to configure: <ul style="list-style-type: none"> • Source • Destination
Pool Address	Select a NAT pool address or click Create to create a new NAT pool address
<i>Routing Instance</i>	
Device	Select a device for a routing instance.
Routing Instance	Select the required routing instance from the list of available routing instances for the selected device.
Port	Enter the port number for the destination Nat pool type.
<i>Advanced</i>	
Host Address Base	Specify the base address of the original source IP address range. This is used for IP address shifting.

Table 200: NAT Pool Settings (*continued*)

Setting	Guideline
Translation	<p>Specify the following translation type for the incoming traffic:</p> <ul style="list-style-type: none"> • No Translation—There is no translation required for the incoming traffic. • Port/Range—Set the global default single port range for source NAT pools with port translation. • Overload
Address Pooling	<p>Specify a NAT address pooling behavior:</p> <ul style="list-style-type: none"> • Paired—Use this option for applications that require all sessions associated with one internal IP address to be translated to the same external IP address for multiple sessions. • Non-Paired—Use this option for applications that can be assigned IP addresses in a round-robin fashion.
Address Sharing	<p>Specify that multiple internal IP addresses can be mapped to the same external IP address. Use this option only when the source NAT pool is configured with no port translation. When a source NAT pool has only one or few external IP addresses available, the address sharing option with a many-to-one address mapping increases NAT resources and improves traffic.</p>
Overflow Pool Type	<p>Specify a source pool to use when the current address pool is exhausted.</p> <ul style="list-style-type: none"> • Interface—Allow the interface pool to support overflow. • Pool—Name of the source address pool. <ul style="list-style-type: none"> • Overflow Pool—Once addresses from the original source NAT pool are exhausted, IP addresses and port numbers are allocated from the overflow pool. A user-defined source NAT pool or an egress interface can be used as the overflow pool. (When the overflow pool is used, the pool ID is returned with the address.)
Start	<p>Specify the beginning port range for the source NAT pools, if the Translation type is Port/Range. The starting and ending port range is 1024 through 65535.</p>
End	<p>Specify the end port range. The starting and ending port range is 1024 through 65535.</p>
Port Overloading Factor	<p>Configure the port overloading-capacity for a source NAT pool. If the factor is set to x, each translated IP address has x times the maximum number of ports available. The range is 2 through 32.</p>

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Note: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Note: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

Showing and Deleting Unused Policies and Objects

You can show or delete unused policies and objects in your network configurations.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Showing Unused Policies and Objects

You can view all unwanted policies or objects that are not used anywhere in your network to take appropriate action.

To show unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are showing.
2. From the landing page, click **More**.

A list of actions appears.

3. Select **Show Unused**.

A list of unused objects (not referenced in any policy) and unused policies appear on the page.

Deleting Unused Policies and Objects

You can clear all unwanted policies or objects that are not used anywhere in your network.

To delete unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are deleting.
2. Select the check boxes beside the items that you want to delete. Right-click on the policy or object or click **More** from the landing page.

A list of actions appears.

3. Select **Delete Unused**.

A confirmation window appears before you can delete the unused policies or objects.

4. Click **Yes** to confirm the deletion.

All unused policies or objects are deleted.

Showing Duplicate Policies and Objects

To display duplicate objects:

1. Select the check box beside the object(s).
2. Right click and select **Show Duplicates**, or select **Show Duplicates** from the **More** list.

The **Show Duplicates** page appears.

3. Select the duplicate object, and perform any of the following steps:

- Select **Merge** from the **More** list to merge objects.

The merge operation deletes or replaces the reference for only the custom services and not the predefined services. If the selected duplicate objects are referenced in any other services (firewall policy) and security objects (service groups), a warning message is provided before the objects are merged.

- Select **Find Usage** from the **More** list to locate the usage of the duplicate objects.
- Click the Delete icon (X) to delete the duplicate object(s).

Viewing Policy and Shared Object Details

On a policy or a shared object landing page, you can get a detailed view of the existing policies or objects. The Detail View page lists all the configured parameters of a policy or an object. The Landing page of a

policy or shared object lists only some of the configured parameters and not all. The Detail View option helps you to get a consolidated view of all the configured parameters.

NOTE: The detailed view is in read-only mode; you cannot edit any fields.

To see a detailed view of the policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears

2. Right-click the policy or shared object that you want to see the detailed view for, or select **Detail View** from the More list.

The Detail View page appears showing the configuration information, the user who created that particular policy or shared object, and the last updated information.

You can also get a detailed view by hovering over the name and clicking the Detailed View icon before the policy or shared object name.

Assigning Policies and Profiles to Domains

You can assign or reassign policies or profiles to different domains when it is first configured and whenever you want to implement a change. You can assign only one policy or profile at a time. Before assigning a policy or profile to another domain, Security Director checks for the validity of the move. If the move is not acceptable, a warning message appears.

To assign a policy or profile to a domain:

1. Select **Configure** and select the landing page for the type of policy or profile that you are assigning to a domain.
2. From the landing page, right-click the policy or profile or click **More**.

A list of actions appears.

3. Select **Assign**<Policy or Profile> to **Domain**.

The Assign <Policy or Profile> to Domain page appears.

NOTE: <Policy or Profile> is the name of the policy or profile that you are assigning to a domain.

4. Select the required items to assign to a domain.
5. Enable this option to ignore warning messages, if any.
6. Click **Assign**.

A policy or profile is assigned to a domain.

- [UTM Licensing | 609](#)
- [UTM Components | 610](#)

Unified Threat Management (UTM) is a term used to describe the consolidation of several security features into one device to protect against multiple threat types. The advantage of UTM is a streamlined installation and management of multiple security capabilities.

The following security features are provided as part of the UTM solution:

- **Antispam**—This feature examines transmitted messages to identify e-mail spam. E-mail spam consists of unwanted messages usually sent by commercial, malicious, or fraudulent entities. When the device detects an e-mail message deemed to be spam, it either drops the message or tags the message header or subject field with a preprogrammed string. The antispam feature uses a constantly updated Spamhaus Block List (SBL). Sophos updates and maintains the IP-based SBL.
- **Full file-based antivirus**—A virus is an executable code that infects or attaches itself to other executable code to reproduce itself. Some malicious viruses erase files or lock up systems. Other viruses merely infect files and overwhelm the target host or network with bogus data. The full file-based antivirus feature provides file-based scanning on specific application layer traffic, checking for viruses against a virus signature database. The antivirus feature collects the received data packets until it has reconstructed the original application content, such as an e-mail file attachment, and then scans this content. Kaspersky Lab provides the internal scan engine.
- **Express antivirus**—Express antivirus scanning is offered as a less CPU-intensive alternative to the full file-based antivirus feature. The express antivirus feature is similar to the antivirus feature in that it scans specific application layer traffic for viruses against a virus signature database. However, unlike full antivirus, express antivirus does not reconstruct the original application content. Rather, it just sends (streams) the received data packets, as is, to the scan engine. With express antivirus, the virus scanning is executed by a hardware pattern-matching engine. This improves performance while scanning is occurring, but the level of security provided is lessened. Juniper Networks provides the scan engine.
- **Content filtering**—Content filtering blocks or permits certain types of traffic based on the MIME type, file extension, protocol command, and embedded object type.
- **Web filtering**—Web filtering lets you manage Internet usage by preventing access to inappropriate Web content. The following types of Web filtering solutions are available:
 - **Integrated Web filtering**—Blocks or permits Web access after the device identifies the category for a URL either from user-defined categories or from a category server (Websense provides the SurfControl Content Portal Authority (CPA) server).
 - **Redirect Web filtering**—Intercepts HTTP requests and forwards the server URL to an external URL filtering server to determine whether to block or permit the requested Web access. Websense provides the URL filtering server.
 - **Juniper local Web filtering**—Blocks or permits Web access after the device identifies the category for a URL from user-defined categories stored on the device.

UTM Licensing

All UTM components require licenses with the exception of content filtering with custom URLs only. This is because Juniper Networks leverages third-party technology that is constantly updated to provide the most up-to-date inspection capabilities. Licenses can be purchased individually or as bundled licenses with other features like AppSecure and IPS. The licenses are term based.

UTM Components

UTM components include custom objects, feature profiles, and UTM policies that can be configured on SRX Series devices. From a high-level, feature profiles specify how a feature is configured and then applied to UTM policies, which then in turn is applied to firewall policies, as shown in Figure 1.

Figure 53: UTM Components

UTM profiles do not have their own seven-tuple rulebase; in a sense they inherit the rules from the firewall rule. The strength of the UTM feature comes from URL filtering, where you can have a separate configuration for different users or user groups.

- **Custom Object**—Although SRX devices support predefined feature profiles that can handle most typical use cases, there are some cases where you might need to define your own objects, specifically for URL filtering, antivirus filtering, and content filtering.
- **Feature Profiles**—Feature profiles specify how components of each profile should function. You can configure multiple feature profiles that can be applied through different UTM policies to firewall rules.
- **UTM Policies**—UTM policies perform as a logical container for individual feature profiles. UTM profiles are then applied to specific traffic flows based on the classification of rules in the firewall policy. This allows you to define separate UTM policies per firewall rule to differentiate the enforcement per firewall rule. Essentially, the firewall rulebase acts as the match criteria, and the UTM policy is the action to be applied.
- **Firewall Policy**—You can predefine feature profiles for the UTM policy that are then applied to the firewall rules. This gives you the advantage of using the predefined UTM policy for that one UTM technology (for example, antivirus or URL filtering), not both.

[Selecting a Web Filtering Solution | 625](#)

Creating UTM Policies

Use the Unified Threat Management (UTM) policy page to configure UTM policies. UTM consolidates several security features into one device to protect against multiple threat types. The UTM policy wizard provides step-by-step procedures to create a UTM policy. You can configure multiple profiles by launching the respective wizards from the UTM policy wizard.

Before You Begin

- Read the UTM Overview topic.
- Review the UTM Policy main page for an understanding of your current data set. See [“UTM Policies Main Page Fields” on page 618](#) for field descriptions.
- Decide the filtering profile you want for the UTM policy: Web Filtering, Antispam, Antivirus, or Content Filtering.

Configuring UTM Policy Settings

To configure UTM policies:

1. Select **Configure > UTM Policy**.
2. Click the + icon to create a new UTM policy.
3. Complete the configuration according to the guidelines provided in [Table 204 on page 612](#).
4. Configure a filtering profile for your UTM policy:
 - Antispam—Examine transmitted e-mail messages to identify e-mail spam over SMTP. For more information, see [“Creating Antispam Profiles” on page 637](#).
 - Antivirus—Inspect files transmitted over several protocols (HTTP, FTP upload and download, IMAP, SMTP, and POP3) to determine if the files exchanged are known malicious files, similar to how desktop antivirus software scans files for the same purpose. For more information, see [“Creating Antivirus Profiles” on page 633](#).
 - Content filtering—Block or permit certain types of traffic over several protocols (HTTP, FTP upload and download, IMAP, SMTP, and POP3) based on the MIME type, file extension, protocol command, and embedded object type. For more information, see [“Creating Content Filtering Profiles” on page 641](#).
 - Web Filtering—Manage Internet usage by preventing access to inappropriate Web content over HTTP. For more information, see [“Creating Web Filtering Profiles” on page 620](#).
 - Device—Configure UTM global options for a device. The device profile refers to the antispam, antivirus, and Web filtering profiles. For more information, see [“Creating Device Profiles” on page 646](#).
5. Click **Finish**. A new UTM policy is created.

Table 204: UTM Policy Settings

Setting	Guideline
Name	Enter a unique name for the UTM policy that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters.
Description	Enter a description for the UTM policy; maximum length is 255 characters.
Traffic Options	<p>Specify traffic options for the UTM policy.</p> <p>In an attempt to consume all available resources, a malicious user might generate a large amount of traffic all at once. To prevent such activity from succeeding, you can impose traffic options:</p> <ul style="list-style-type: none"> • Connection limit per client—Specify the connection limit per client; default is 2000. • Action when connection limit is reached—Specify the action that must be taken once the connection limit is reached. The available actions are None, Log and Permit, and Block.

Comparing Policies

Security Director enables you to compare two policies.

To compare any two policies:

1. Select **Configure** and select the landing page for the type of policy that you want to compare. For example, Select **Firewall Policies**.
2. From the landing page, right-click the policy or click **More**.
A list of actions appears.
3. Select **Compare Policy** to compare with other policies.
The Compare Policy page appears
4. Select the policy to compare with, and click **OK**.
The compare result of the two policies are displayed.

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

RELATED DOCUMENTATION

[Creating Firewall Policies | 358](#)[Creating IPS Policies | 507](#)[Creating NAT Policies | 567](#)

Viewing Policy and Shared Object Details

On a policy or a shared object landing page, you can get a detailed view of the existing policies or objects. The Detail View page lists all the configured parameters of a policy or an object. The Landing page of a policy or shared object lists only some of the configured parameters and not all. The Detail View option helps you to get a consolidated view of all the configured parameters.

NOTE: The detailed view is in read-only mode; you cannot edit any fields.

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears

2. Right-click the policy or shared object that you want to see the detailed view for, or select **Detail View** from the More list.

The Detail View page appears showing the configuration information, the user who created that particular policy or shared object, and the last updated information.

You can also get a detailed view by hovering over the name and clicking the Detailed View icon before the policy or shared object name.

Assigning Policies and Profiles to Domains

You can assign or reassign policies or profiles to different domains when it is first configured and whenever you want to implement a change. You can assign only one policy or profile at a time. Before assigning a policy or profile to another domain, Security Director checks for the validity of the move. If the move is not acceptable, a warning message appears.

To assign a policy or profile to a domain:

1. Select **Configure** and select the landing page for the type of policy or profile that you are assigning to a domain.
2. From the landing page, right-click the policy or profile or click **More**.
A list of actions appears.

3. Select **Assign <Policy or Profile> to Domain**.

The Assign <Policy or Profile> to Domain page appears.

NOTE: <Policy or Profile> is the name of the policy or profile that you are assigning to a domain.

4. Select the required items to assign to a domain.
5. Enable this option to ignore warning messages, if any.
6. Click **Assign**.
A policy or profile is assigned to a domain.

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

Showing and Deleting Unused Policies and Objects

You can show or delete unused policies and objects in your network configurations.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Showing Unused Policies and Objects

You can view all unwanted policies or objects that are not used anywhere in your network to take appropriate action.

To show unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are showing.
2. From the landing page, click **More**.

A list of actions appears.

3. Select **Show Unused**.

A list of unused objects (not referenced in any policy) and unused policies appear on the page.

Deleting Unused Policies and Objects

You can clear all unwanted policies or objects that are not used anywhere in your network.

To delete unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are deleting.
2. Select the check boxes beside the items that you want to delete. Right-click on the policy or object or click **More** from the landing page.

A list of actions appears.

3. Select **Delete Unused**.

A confirmation window appears before you can delete the unused policies or objects.

4. Click **Yes** to confirm the deletion.

All unused policies or objects are deleted.

UTM Policy-Web Filtering Profiles

IN THIS CHAPTER

- [Creating Web Filtering Profiles | 620](#)
- [Selecting a Web Filtering Solution | 625](#)
- [Web Filtering Profile Main Page Fields | 626](#)

Creating Web Filtering Profiles

Use the Unified Threat Management (UTM) policy page to configure Web filtering profiles.

Web filtering lets you manage Internet usage by preventing access to inappropriate Web content. The following Web filtering solutions are supported:

- **Integrated Web Filtering**—Blocks or permits Web access after the device identifies the category for a URL, either from user-defined categories or from a category server (SurfControl Content Portal Authority provided by Websense).

NOTE: Integrated Web filtering feature is a separately licensed subscription service.

- **Redirect Web Filtering**—Intercepts HTTP requests and forwards the server URL to an external URL filtering server to determine whether to block or permit the requested Web access. Websense provides the URL filtering server.

NOTE: Redirect Web filtering does not require a license.

- **Juniper Local Web Filtering**—Intercepts every HTTP request in a TCP connection. In this case, the decision making is done on the device after it looks up a URL to determine if it is in the whitelist or blacklist based on its user-defined category.

NOTE: Local Web filtering does not require a license or a remote category server.

Once you create a profile, you can assign it to UTM policies. Within the UTM policy, you can apply either the same Web filtering profile or create one inline.

Before You Begin

- Read the UTM Overview topic.
- Decide the filtering profile you want for the UTM policy: Web Filtering, Antispam, Antivirus, or Content Filtering.
- Review the Web Filtering Profile main page for an understanding of your current data set. See [“Web Filtering Profile Main Page Fields” on page 626](#) for field descriptions.

Configuring Web Filtering Profile Settings

To create a Web filtering profile:

- Select **Configure > UTM Policy > Web Filtering**.
- Click the + icon to create a new Web filtering profile
- Complete the configuration according to the guidelines provided in [Table 206 on page 621](#).
- Click **Finish**. A new Web filtering profile is created that you can associate with an UTM policy.

Table 206: Web Filtering Profile Settings

Setting	Guideline
General Information	
Name	Enter a unique name for the Web filtering profile that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters.
Description	Enter a description for the Web filtering profile; maximum length is 255 characters.
Engine Type	Select the required engine type from the drop-down list: <ul style="list-style-type: none"> • Juniper Enhanced— Configure UTM enhanced Web filtering. • Surf Control—Configure a profile for the Web filtering surf-control integrated feature. • Websense Redirect—Configure a redirect Web filtering profile.
Default Action	Select the default action from the drop-down list. NOTE: This option is available only for Juniper Enhanced and Surf Control engine types.

Table 206: Web Filtering Profile Settings (continued)

Setting	Guideline
Safe Search	<p>Select a safe search solution to ensure that the embedded objects such as images on the URLs received from the search engines are safe and that no undesirable content is returned to the client.</p> <p>By default, the Safe Search check box is selected</p> <p>NOTE: This option is available only for the Juniper Enhanced engine type. Safe search redirect supports HTTP only. You cannot extract the URL for HTTPS. Therefore, it is not possible to generate a redirect response for HTTPS search URLs. Safe search redirects can be disabled by clearing the Safe Search check box.</p>
Custom Block Message	<p>Specify a custom message to be sent when HTTP requests are blocked.</p> <p>NOTE: If a message begins with http: or https:, the message is considered a block message URL. Messages that begin with values other than http: or https: are considered custom block messages.</p>
Custom Quarantine Message	<p>Custom Quarantine Message Use UTM enhanced Web filtering to support block, log and permit, and permit actions on HTTP/HTTPS requests. Additionally, it supports the quarantine action, which allows or denies access to the blocked site based on the user's response to the message.</p> <p>The quarantine message contains the following information:</p> <ul style="list-style-type: none"> • URL name • Quarantine name • Category (if available) • Site-reputation (if available) <p>Example: If you set the action for Enhanced_Search_Engines_and_Portals to quarantine, and you try to access www.search.yahoo.com, the quarantine message is as follows:</p> <p>***The requested webpage is blocked by your organization's access policy***.</p>
Base Filter	<p>When a URL category version is downloaded, a predefined base filter with default actions are also downloaded. All categories have default actions in a base filter. The base filter can be attached to user profile, which acts like a backup filter. The base filter takes action for the categories that are not configured in a user profile.</p>
URL Categories	

Table 206: Web Filtering Profile Settings (continued)

Setting	Guideline
	<p>A URL category is a list of URL patterns grouped under a single title so a single action that applies to all URL patterns can be performed on the list.</p> <p>Click the + icon to select one or more URL categories, an action, and a redirect profile. A redirect profile is applicable only for block and quarantine actions. You can create a new redirect profile by clicking Create New Redirect Profile. The created redirect profile is displayed in the Redirect Profile drop-down list. The following actions are available:</p> <ul style="list-style-type: none"> • Log and Permit—Create a list of URL patterns that are logged, then permitted. • Block—Create a list of URL patterns that are denied access. • Quarantine—Create a list of URL patterns that are quarantined. • Permit—Create a list of URL patterns that are permitted. <p>Edit the action or redirect profile by clicking Apply Actions and updating the action and redirect profile.</p> <p>Delete the URL category by selecting the URL category and clicking the X icon.</p>
Fallback Options	
	<p>The fallback options are used when the web filtering system experiences errors and must fallback to one of the previously configured actions to either deny (block) or permit the object.</p> <ul style="list-style-type: none"> • Default Action— Select Log and Permit or Block from the drop-down list.
Global Reputation Actions	

Table 206: Web Filtering Profile Settings (continued)

Setting	Guideline
Uncategorized URL Actions	<p>Select this check box if you want to apply global reputation actions.</p> <p>Enhanced Web filtering intercepts HTTP and HTTPS requests and sends the HTTP URL or the HTTPS source IP to the Websense ThreatSeeker Cloud (TSC). The TSC categorizes the URL into one of the predefined categories and also provides site reputation information for the URL to the device. The device determines if it can permit or block the request based on the information provided by the TSC.</p> <p>The URLs can be processed using their reputation score if there is no category available. Select the action that you wish to take for the uncategorized URLs based on their reputation score:</p> <ul style="list-style-type: none"> • Very Safe—Permit, log and permit, block, or quarantine a request if a site reputation of 90 through 100 is returned. By default, Permit is selected. • Moderately Safe—Permit, log and permit, block, or quarantine a request if a site reputation of 80 through 89 is returned. By default, Log and Permit is selected. • Fairly Safe—Permit, log and permit, block or quarantine a request if a site-reputation of 70 through 79 is returned. By default, Log and Permit is selected. • Suspicious—Permit, log and permit, block, or quarantine a request if a site reputation of 60 through 69 is returned. By default, Quarantine is selected. • Harmful—Permit, log and permit, block, or quarantine a request if a site reputation of 1 through 59 is returned. By default, Block is selected. <p>NOTE: The Use global reputation check box is selected by default.</p>

Selecting a Web Filtering Solution

There are three options for enabling Web filtering. Use Table 1 to help you decide which option is right. The Web filtering solutions table gives you the pros and cons of each option.

Table 207: Web Filtering Solutions

Web Filtering Option	Pros	Cons
Integrated Web Filtering	<p>Is the most powerful integrated method in terms of detection.</p> <p>It has a granular list of URL categories, support for Google Safe Search, and a reputation engine.</p> <p>This option can also redirect you to a custom URL for block pages</p>	<p>Requires an Internet connection to be able to contact the Threatseeker cloud.</p> <p>Integrated Web filtering is also a separately licensed subscription service.</p>
Redirect Web Filtering	<p>Does not require an Internet connection; all queries are tracked locally.</p> <p>This option has a slightly lower latency because the server is onsite.</p>	<p>Requires a separate Websense server.</p> <p>Redirect Web filtering does not have as much functionality as directing the entire HTTP session through the Websense server.</p>
Juniper Local Web Filtering	<p>Does not require a license.</p> <p>Juniper local Web filtering is good for defining your own blacklist or whitelist.</p> <p>This option is good if you have only a handful of URLs on which you want to enforce a policy.</p>	<p>Is not ideal for broad URL filtering support.</p>

UTM Policy-Category Update

IN THIS CHAPTER

- About the Category Update Page | 627
- Configuring the Download URL Settings | 629
- Downloading and Installing URL Categories | 630
- Uploading and Installing URL Categories | 631
- Installing URL Categories on SRX Series Devices | 632

About the Category Update Page

To access this page, click **Configure > UTM Policy > Category Update**.

Use the Category Update page to download and install a URL category dynamically. You can download the Websense Enhanced Web Filtering category version from the category download site at <https://update.juniper-updates.net> and install it without upgrading Security Director. Websense occasionally releases new Enhanced Web Filtering categories. The category list is available in a file in JSON format. It supports a predefined base filter and all categories have default actions in the base filter. The base filter can be attached to a user profile, which acts like a backup filter. The base filter takes action for the categories that are not configured in a user profile.

The category file is downloaded into Junos Space server in the following ways:

- Security Director automatically downloads the category file from the category download site for the first time, if there is no category version available.
- You can download required version or latest version of category file.
- You can upload category file into Junos Space server. This is useful when you do not have internet connection to the Junos Space server.

NOTE:

- Maximum available Websense categories are 1000.
- Maximum available base filters are 16.

Tasks You Can Perform

You can perform the following tasks from this page:

- Configure URL settings. See [“Configuring the Download URL Settings” on page 629](#).
- Download a category file and install it on SRX Series devices with an Enhanced Web Filtering license. See [“Downloading and Installing URL Categories” on page 630](#).
- Uploading and installing a category file to the Junos Space Server. See [“Uploading and Installing URL Categories” on page 631](#).
- Installing categories on newly added devices. See [“Installing URL Categories on SRX Series Devices” on page 632](#).

Field Descriptions

[Table 209 on page 628](#) provides guidelines on using the fields on the Category Update page.

Table 209: Fields on the Category Update Page

Field	Description
File Version	Specifies the downloaded category file version.
Publish Date	Specifies the date when the Enhanced Web Category File was published in the download site, that is, https://update.juniper-updates.net .
Supported Junos	Specifies the Junos version on which the category file is supported. NOTE: UTM category update is supported only from Junos 17.4 version.
Select Filter	Select a predefined base filter, which has default actions for all categories, for Web filtering.
Name	Specifies the category name in the base filter.
Action	Specifies the action for the categories in the base filter.

RELATED DOCUMENTATION

Configuring the Download URL Settings

You can configure the download site URL from wherever the URL category package needs to be downloaded. By default, <https://update.juniper-updates.net> is the download URL. Whenever a new category is released from Websense, it will be available at the Juniper Networks download site at <https://update.juniper-updates.net>. Websense occasionally releases new Enhanced Web Filtering categories.

To configure the download URL:

1. Select **Configure** > **UTM Policy** > **Category Update**.

The Category Update page is displayed.

2. Click **Settings**.

The Settings page is displayed.

3. Enter the URL from where the URL category package has to be downloaded. By default, the Juniper Networks download site URL is displayed. For example, you see <https://update.juniper-updates.net>.
4. Browse and select a UTM server certificate file (*.crt or *.pem).
5. Enable the option to send the download configuration traffic through a proxy server.
6. Click **OK**.

RELATED DOCUMENTATION

Downloading and Installing URL Categories

You can download the current URL category version or a specific version. Besides downloading the category file, you can also choose to install it. You can also specify whether you want to run a job immediately or schedule it for a later time.

Before You Begin

Configure the download URL settings. See [“Configuring the Download URL Settings” on page 629](#).

Procedure

To download and install a URL category:

1. Select **Configure > UTM Policy > Category Update**.

The Category Update page is displayed.

2. Click **Download**.

The Download and Install Settings page is displayed.

3. Select the latest version option or specify an available version number.

4. Select the **Download and Install** option if you want to install the categories after downloading them.

5. Specify whether you want to run a job immediately or schedule it for a later time.

6. Click **OK**.

If you have not selected the Download and Install option, the Job Detail:Download URL Categories page with a summary of download status is displayed.

If you have selected the Download and Install option, the Job Status page is displayed with the status of the URL category download, probing for devices with an EWF license or category version, and installing URL categories on SRX Series devices with an EWF license.

RELATED DOCUMENTATION

[About the Category Update Page | 627](#)

[Configuring the Download URL Settings | 629](#)

[Uploading and Installing URL Categories | 631](#)

[Installing URL Categories on SRX Series Devices | 632](#)

Uploading and Installing URL Categories

You can upload a URL category package file to a Junos Space server and choose to install the URL categories after the upload.

Before You Begin

Download the EWF URL category file *utm_category_package_1.tgz* from <https://update.juniper-updates.net/EWF/> and save it in your local system.

Procedure

To upload and install categories:

1. Select **Configure > UTM Policy > Category Update**.

The Category Update page is displayed.

2. Click **Offline Upload**.

The Upload page is displayed.

3. Browse and select the category file *utm_category_package_1.tgz* from your local system.

4. Select **Upload and Install** to install the URL categories on the SRX Series devices with an EWF license after uploading it to the Junos Space server.

5. Click **Upload**.

If you did not select Upload and Install, then the URL categories are only uploaded to the Junos Space server.

The Job Detail:Download URL Categories (Offline) page for downloading URL categories is displayed.

RELATED DOCUMENTATION

[Downloading and Installing URL Categories | 630](#)

[Installing URL Categories on SRX Series Devices | 632](#)

Installing URL Categories on SRX Series Devices

You can install URL categories on SRX Series devices with an EWF license. All SRX Series devices with an EWF license are listed in a table. If your device is not listed, then you can probe for SRX Series devices to show up in the table.

To install URL categories on devices with an EWF license:

1. Select **Configure > UTM Policy > Category Update**.

The Category Update page is displayed.

2. Click **Install**.

The Install Category page is displayed. A category version is also displayed in the page title, depending on the category version downloaded.

3. Select the devices with an EWF license.

If a device is not displayed, you can click **Probe Devices** to probe for devices.

4. Specify whether you want to run a job for installing the categories immediately or schedule it for a later time.

5. Click **OK**.

The Job Details page is displayed with details, such as type, ID, user state, and so on.

UTM Policy-Antivirus Profiles

IN THIS CHAPTER

- [Creating Antivirus Profiles | 633](#)
- [Antivirus Profile Main Page Fields | 635](#)

Creating Antivirus Profiles

Use the Unified Threat Management (UTM) policy page to configure antivirus profiles.

The antivirus profile defines the content to scan for any malware and the action to be taken when malware is detected. Once you create a profile, you can assign it to UTM policies. Within the UTM policy, you can apply either the same antivirus profile or create one inline to scan Web, file transfer, and e-mail traffic.

Before You Begin

- Read the UTM Overview topic.
- Decide what kind of filtering you want for the UTM policy: Web Filtering, Antispam, Antivirus, or Content Filtering.
- Review the Antivirus Profile main page for an understanding of your current data set. See [“Antivirus Profile Main Page Fields” on page 635](#) for field descriptions.

Configuring Antivirus Profile Settings

To create an antivirus profile:

- Select **Configure > UTM Policy > Antivirus Profiles**.
- Click the + icon to create a new antivirus profile.
- Complete the configuration according to the guidelines provided in [Table 210 on page 634](#).
- Click **Finish**. An antivirus profile is created that can be associated with an UTM policy.

Table 210: Antivirus Profile Settings

Setting	Guideline
<i>General Information</i>	
Name	Enter a unique name for the antivirus profile that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters.
Description	Enter a description for the antivirus profile; maximum length is 255 characters.
Engine Type	<p>Select the required engine type from the drop-down list:</p> <ul style="list-style-type: none"> • Kaspersky—Kaspersky Lab engine is responsible for scanning all the data it receives. • Juniper Express—You configure a profile for the Juniper Express engine. Mostly used for express antivirus scanning. • Sophos—Sophos antivirus is an in-the-cloud antivirus solution. The virus and malware database is located on external servers maintained by Sophos (Sophos Extensible List) servers, thus there is no need to download and maintain large pattern databases on the Juniper Networks device. <p>NOTE: By default, Juniper Express is selected.</p>
<i>Fallback Options</i>	
	<p>The fallback options are used when the antivirus system experiences errors and must fall back to one of the previously configured actions to either deny (block) or permit the object.</p> <p>Use the fallback options to be configured when there is a failure, or select the default action if no specific options are to be configured:</p> <ul style="list-style-type: none"> • Content Size—Select Block or Log and Permit. If the content size exceeds a set limit, the content is either passed or blocked. The default action is Block. • Content Size Limit—Enter the content size limit in kilobytes (KB). The limit range is 20 - 40,000 KB. The content size limit check occurs before the scan request is sent. The content size refers to accumulated TCP payload size. • Engine Error—Select Block or Log and Permit. The default action is Block. Note: Engine error combines all errors, engine not ready, timeout, too many requests, and out of resources, into a single fallback option. • Default Action—Select Block or Log and Permit.
Notification Options	

Table 210: Antivirus Profile Settings (continued)

Setting	Guideline
	<p>Use the notification options to configure a method of notifying the user when a fallback occurs or a virus is detected:</p> <ul style="list-style-type: none"> • Fallback Deny—Select this option to notify mail senders that their messages were blocked. • Fallback Non-Deny—Select this option to warn mail recipients that they received unblocked messages despite problems. • Virus Detected—Select this option to notify mail recipients that their messages were blocked.

UTM Policy-Antispam Profiles

IN THIS CHAPTER

- [Creating Antispam Profiles | 637](#)
- [Antispam Profile Main Page Fields | 639](#)

Creating Antispam Profiles

Use the Unified Threat Management (UTM) policy page to configure antispam profiles.

E-mail spam consists of unwanted e-mail messages usually sent by commercial, malicious, or fraudulent entities. When the device detects an e-mail message deemed to be spam, it either blocks the message or tags the message header or subject field with a preprogrammed string. Antispam filtering allows you to use both a third-party server-based spam block list (SBL) and to optionally create your own local whitelists (benign) and blacklists (malicious) for filtering against e-mail messages.

NOTE: Sophos updates and maintains the IP-based SBL. Antispam is a separately licensed subscription service.

Once you create a profile, you can assign it to UTM policies. Within the UTM policy, you can apply either the same antispam profile or create one inline to scan e-mail traffic.

Before You Begin

- Read the UTM Overview topic
- Decide what kind of filtering you want for the UTM policy: Web filtering, antispam, antiviruses, or content filtering.
- Review the Antispam Profile main page for an understanding of your current data set. See [“Antispam Profile Main Page Fields” on page 639](#) for field description.

Configuring Antispam Profile Settings

To create an antispam profile:

1. Select **Configure > UTM Policy > Antispam Profiles**.
2. Click the + icon to create a new antispam profile.
3. Complete the configuration according to the guidelines provided in [Table 212 on page 638](#).

Table 212: Antispam Profile Settings

Setting	Guideline
<i>General Information</i>	
Name	Enter a unique name for the antispam profile that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters.
Description	Enter a description for the antispam profile; maximum length is 255 characters.
Use Sophos Blacklist	<p>Select this check box to use server-based spam filtering. This check box is selected by default. If the box is unchecked, local spam filtering is used. Server-based antispam filtering requires Internet connectivity with the spam block list (SBL) server. Domain Name Service (DNS) is required to access the SBL server. The firewall performs SBL lookups through the DNS protocol.</p> <p>NOTE: Server-based spam filtering supports only IP-based spam block list blacklist lookup. Sophos updates and maintains the IP-based spam block list. Server-based antispam filtering is a separately licensed subscription service.</p>
<i>Action</i>	
Default Action	<p>Select the antispam action that the device should take when it detects spam:</p> <ul style="list-style-type: none"> • Tag Email Subject Line • Tag SMTP Header • Block Email • Note
Custom Tag	Enter a custom string for identifying a message as spam. By default, the device uses ***SPAM*** .

1. Select **Configuration > Manage**.
2. Review the configuration.
3. Click **Commit**.

UTM Policy-Content Filtering Profiles

IN THIS CHAPTER

- [Creating Content Filtering Profiles | 641](#)
- [Content Filtering Profile Main Page Fields | 644](#)

Creating Content Filtering Profiles

Use the Unified Threat Management (UTM) policy page to configure content filtering profiles.

Content filtering blocks or permits certain types of traffic based on the MIME type, file extension, and protocol command. The content filter controls file transfers across the device by checking traffic against configured filter lists.

NOTE: The content filter profile evaluates traffic before all other UTM profiles, except Web Filtering. Therefore, if traffic meets criteria configured in the content filter, the content filter acts first upon this traffic.

You can configure the following types of content filters:

- **MIME pattern filter**—MIME patterns are used to identify the type of traffic in HTTP and MAIL protocols. There are two lists of MIME patterns that are used by the content filter to determine the action to be taken. The block MIME list contains a list of MIME type traffic that is to be blocked. The MIME exception list contains MIME patterns that are not to be blocked by the content filter and are generally subsets of items on the block list.

NOTE: The exception list has a higher priority than the block list.

- **Block Extension List**—Because the name of a file is available during the transfers, using file extensions is a highly practical way to block or allow file transfers. All protocols support the use of the block extension list.

- Protocol Command Block and Permit Lists—Different protocols use different commands to communicate between servers and clients. By blocking or allowing certain commands, traffic can be controlled on the protocol command level. The block or permit command lists are intended to be used in combination, with the permit list acting as an exception list to the block list.

NOTE: If a protocol command appears on both the permit list and the block list, the command is permitted.

Before You Begin

- Read the UTM Overview topic.
- Decide what kind of filtering you want for the UTM policy: Web Filtering, Antispam, Antivirus, or Content Filtering.
- Review the Content Filtering Profile main page for an understanding of your current data set. See [“Content Filtering Profile Main Page Fields” on page 644](#) for field descriptions.

Configuring Content Filtering Profile Settings

To create a content filtering profile:

- Select **Configur > UTM Policy > Content Filtering Profiles**.
- Click the + icon to create a new content filtering profile.
- Complete the configuration according to the guidelines provided in [Table 214 on page 642](#).
- Click **Finish**. A content filtering profile is created that can be associated with an UTM policy.

Table 214: Content Filtering Profile Settings

Setting	Guideline
<i>General Information</i>	
Name	Enter a unique name for the content filtering profile that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters.
Description	Enter a description for the content filtering profile; maximum length is 255 characters.
<i>Notification Options</i>	

Table 214: Content Filtering Profile Settings (*continued*)

Setting	Guideline
	<p>Use the notification options to configure a method of notifying the user when a failure occurs or a virus is detected:</p> <ul style="list-style-type: none"> • Notify Mail Sender—Select this check box if you want to notify the sender. • Notification Type—Select the type of notification, Protocol or Message from the drop-down list. • Custom Notification Message—Enter a custom notification message.
<i>Protocol Commands</i>	
	<p>Use content filtering to block specific commands for HTTP, FTP, SMTP, IMAP, and POP3 protocols. Select the following options:</p> <ul style="list-style-type: none"> • Command Block List—Enter the protocol commands to be blocked. Use commas to separate each command. • Command Permit List—Enter the protocol commands to be permitted. Use commas to separate each command.
<i>Content Types</i>	
	<p>Use the content filter to block other types of harmful files that the MIME type or the file extension cannot control.</p> <p>Block Content Type—Select from the following types of content blocking (supported only for HTTP):</p> <ul style="list-style-type: none"> • Active X • Windows executables (.exe) • HTTP cookie • Java applet • ZIP files
<i>File Extensions</i>	
	<p>Use a file extension list to define a set of file extensions to block over HTTP, FTP, SMTP, IMAP, and POP3.</p> <ul style="list-style-type: none"> • Extension Block List—Enter file extensions to block separated by commas. For example, exe, pdf, js, and so forth.
<i>MIME Types</i>

UTM Policy-Global Device Profiles

IN THIS CHAPTER

- [Creating Device Profiles | 646](#)
- [Device Profiles Main Page Fields | 649](#)

Creating Device Profiles

Use the Unified Threat Management (UTM) policy page to configure device profiles.

The device profile is used to configure UTM global options for a device. The device profile refers to the antispam, antivirus, and Web filtering profiles.

Before You Begin

- Read the UTM Overview topic.
- Decide which kind of filtering you want for the UTM policy: Web filtering, antispam, antivirus, content filtering, or device.
- Review the device profile main page for an understanding of your current data set. See [“Device Profiles Main Page Fields” on page 649](#) for field descriptions.

WARNING: When you configure the MIME whitelist feature, be aware that, because header information in HTTP traffic can be spoofed, you cannot always trust HTTP headers to be legitimate. When a Web browser is determining the appropriate action for a given file type, it detects the file type without checking the MIME header contents. However, the MIME whitelist feature does refer to the MIME encoding in the HTTP header. For these reasons, it is possible in certain cases for a malicious website to provide an invalid HTTP header. For example, a network administrator might inadvertently add a malicious website to a MIME whitelist, and, because the site is in the whitelist, it will not be blocked by Sophos even though Sophos has identified the site as malicious in its database. Internal hosts would then be able to reach this site and could become infected.

Configuring Device Profile Settings

To create a device profile:

- Select **Configure > UTM Policy > Device Profiles**.
- Click **Create**.
- Complete the configuration according to the guidelines provided in Table 1.
- Click **Finish**.

Table 216: Device Profile Settings

Setting	Guideline
<i>General Information</i>	
Name	Enter a unique name for the device profile that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 255 characters.
Description	Enter a description for the device profile; maximum length is 255 characters.
Devices	Assign a device or devices to a profile by selecting the device or devices in the Available column and moving them to the Selected column. NOTE: If a device is already assigned to a profile, it will not be listed in the Available column.
<i>Antispam Profile</i>	
Address Whitelist	Select an address whitelist for local spam filtering. Whitelists include addresses that you want to exclude from undergoing antispam processing. (These lists are configured as custom objects.) NOTE: When both the whitelist and blacklist are in use, the whitelist is checked first. If there is no match, then the blacklist is checked. A
Address Blacklist	Select an address blacklist for local spam filtering. Blacklists include addresses that you want to exclude. (These lists are configured as custom objects.) Note: When both the whitelist and blacklist are in use, the whitelist is checked first. If there is no match, then the blacklist is checked.
<i>Antivirus Profile</i>	

Table 216: Device Profile Settings (*continued*)

Setting	Guideline
MIME Whitelist	<p>Enter MIME types to create MIME bypass lists and exception lists. The device uses MIME types to decide which traffic may bypass antivirus scanning. The MIME whitelist defines a list of MIME types and can contain one or many MIME entries. You can use your own custom object lists, or you can use the default list that ships with the device called <code>junos-default-bypass-mime</code>.</p> <p>The following limitations apply:</p> <ul style="list-style-type: none"> • The maximum number of MIME items in a MIME list is 50. • The maximum length of each MIME entry is restricted to 40 bytes. • The maximum length of a MIME list name string is restricted to 40 bytes.
Exception MIME Whitelist	<p>Enter MIME types to create an exception MIME whitelist that excludes some MIME types from the MIME whitelist. This list is a subset of MIME types found in the MIME whitelist.</p> <p>For example, if the MIME whitelist includes the entry, <code>video/</code> and the exception list includes the entry <code>video/x-shockwave-flash</code>, by using these two lists, you can bypass objects with “<code>video/</code>” MIME type but not bypass “<code>video/x-shockwave-flash</code>” MIME type.</p>
URL Whitelist	<p>Enter URLs or IP addresses to create a list of websites that are always bypassed for scanning.</p> <p>Because antivirus scanning is a CPU and memory intensive action, if there are URLs and IP addresses that you are confident do not require scanning, you might want to create this custom list and add them to it.</p>
<i>Web Filtering Profile</i>	
URL Whitelist	<p>Enter URLs to create a whitelist of websites that are always permitted. With local Web filtering, the firewall intercepts every HTTP request in a TCP connection and extracts the URL. The decision is done on the device after it looks up a URL to determine if it is in the whitelist or blacklist based on its user-defined category.</p> <p>NOTE: A Web filtering profile can contain one whitelist or one blacklist with multiple user-defined categories each with a permit or block action.</p>
URL Blacklist	<p>Enter URLs to create a blacklist of websites that are always blocked.</p> <p>NOTE: A Web filtering profile can contain one whitelist or one blacklist with multiple user-defined categories each with a permit or block action.</p>
Site Reputation	<p>Choose a reputation level. An action will be taken based on the reputation level returned for all types of URLs, whether categorized or uncategorized.</p>

Understanding Application-Based Routing

The relentless growth of voice, data, and video traffic and applications traversing the network requires that networks recognize traffic types to effectively prioritize, segregate, and route traffic without compromising performance or availability. SRX Series Services Gateways support advanced policy-based routing (APBR), also known as application-based routing, to address these requirements.

APBR is a type of session-based, application-aware routing. This mechanism combines policy-based routing with an application-aware traffic management solution. APBR implies classifying flows based on the attributes of the applications and applying filters based on these attributes to redirect the traffic. The flow-classifying mechanism is based on packets representing the application in use.

APBR implements:

- Deep packet inspection (DPI) and pattern-matching capabilities of application identification to identify application traffic or a user session within an application
- Lookup in the application system cache (ASC) for application type and the corresponding destination IP address, destination port, protocol type, and service for a matching rule

If a matching rule is found, the traffic is directed to an appropriate route and the corresponding interface or device.

APBR provides the following advantages:

- Enables you to define the routing behavior based on application attributes.
- Extends the scope of static routes by providing more flexible traffic-handling capabilities by offering granular control for forwarding packets based on application attributes.

APBR involves the following workflow:

- Creating an APBR profile (also referred to as an application profile in this document) that will match the type of traffic that you are going to direct to a different next hop. The profile includes multiple rules. Each rule can contain multiple applications or application groups. If the application matches any of the application or application groups of a rule in a profile, the application profile rule is considered as a match.
- Associating a routing instance with the application profile rule. When the traffic on the ingress zone and interface matches an application profile, the associated static route and next hop defined in the routing instance are used to route the traffic for the particular session.
- Associating the application profile to the ingress traffic. The application profile can be attached to a security zone or it can be attached to a specific logical or physical interface associated with the security zone. If the application profile is applied to a security zone, then all interfaces belonging to that zone are attached to the application profile by default unless a specific configuration already exists for that interface.

[Figure 54 on page 657](#) shows the sequence in which APBR techniques are applied.

Figure 54: APBR Flow Diagram

The following procedure explains the application-based routing:

1. APBR evaluates the packets based on incoming interface to determine whether the session is a candidate for application-based routing. If the traffic has not been flagged for application-based routing, it undergoes normal processing (non-APBR route).
2. If the session needs application-based routing, APBR queries the application system cache (ASC) module to get the application attributes details (IP address, destination port, protocol type, and service).
If the application is found, it is further processed for a matching rule in the APBR profile (see Step 3).
3. APBR uses the application details to look for a matching rule in the APBR profile (application profile).
If a matching rule is found, the traffic is redirected to the specified routing instance for route lookup.

About the Application Routing Policies Page

To access this page, select **Configure > App Routing Policies**.

Use the Application Routing Policies page to configure advanced policy-based routing (APBR) profiles. In advanced WAN routing space, the need for application-aware routing is gaining popularity. Enterprise customers and cloud service providers are taking a software-defined WAN (SD-WAN) approach to minimize the operating cost and to improve or optimize resource usage. The APBR profiles support such emerging network deployments. APBR provides a capability to specify routes based on certain attributes of an end user application. The APBR profile evaluates the application-aware traffic and permits or denies traffic based on the applications and application groups.

Tasks You Can Perform

You can perform the following tasks from this page:

- Create an APBR policy. See [“Configuring Advanced Policy-Based Routing Policy” on page 659](#)
- Manage an APBR policy.
- Create and manage APBR policy rules. See [“Creating Advanced Policy-Based Routing Rules” on page 662](#)

Field Descriptions

[Table 220 on page 658](#) provides guidelines on using the fields on the Application Routing Policies page.

Table 220: Fields on the Application Routing Policies Page

Field	Description
Policy Name	Specifies the name of the APBR policy.
Rules	Specifies the number of rules created for the APBR policy.
Devices	Specifies the number of devices associated with the APBR policy.
Deployment Status	Specifies the publish and update status of the APBR policy.
Last Modified	Specifies the last modified date and time of the APBR policy.
Created By	Specifies the username of a user who created the APBR policy.

Table 220: Fields on the Application Routing Policies Page (*continued*)

Field	Description
Description	Specifies the description of the APBR policy, if any.
Domain	Specifies the domain name to which the APBR policy is associated.

[Creating Advanced Policy-Based Routing Rules | 662](#)

[About the App Based Routing Page | 663](#)

Configuring Advanced Policy-Based Routing Policy

You can use the Add APBR Policy page to create an advanced policy-based routing (APBR) profile (also known as an application profile) to match applications and application groups and redirect the packets that match the profile to the specified routing instance for route lookup. The APBR profile evaluates the application-aware traffic and permits or denies traffic based on attributes of the applications and application groups. The context established in the first packet of a session must match the context contained in all subsequent packets, if a session is to remain active.

The APBR profile is associated to the ingress traffic. The application profile can be attached to a security zone or it can be attached to a specific logical or physical interface associated with the security zone.

To configure an APBR profile:

1. Select **Configure > Application Routing Policies**.

The Application Routing Policies page appears.

2. Click the create icon (+).

The Add APBR Policy page appears.

3. Complete the configuration by using the guidelines in [Table 221 on page 660](#).

4. Click **OK** to complete the configuration.

A new APBR profile is created. Click **Add Rule** or the policy name to configure policy rules. See [“About the Rules Page \(Advanced Policy-Based Routing\)”](#) on page 660.

Click **Cancel** to discard the configuration.

Table 221: Fields on the Add APBR Policy Page

Field	Description
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed; maximum length is 63 characters.
Description	Enter a description for the APBR profile; maximum length is 255 characters.
Devices	Select one or more devices to associate them with a policy. However, a device can have only one APBR policy associated, at a time. Select a device in the Available column and move it to the Selected column.

RELATED DOCUMENTATION

Understanding Application-Based Routing 655
About the Application Routing Policies Page 658
About the Rules Page (Advanced Policy-Based Routing) 660
Creating Advanced Policy-Based Routing Rules 662
About the App Based Routing Page 663

About the Rules Page (Advanced Policy-Based Routing)

To access this page, select **Configure > App Routing Policies > Policy Name** or **Rules**.

Use this page to create, edit, clone, or delete APBR policy rules. An APBR profile includes multiple rules. Each rule can contain multiple applications or application groups. If an application profile matches any of the application or application groups of a rule in a profile, the application profile rule is considered to be a match. The traffic is then redirected to the defined routing instance for the route lookup.

Tasks You Can Perform

You can perform the following tasks from this page:

- Create a new rule. See [“Creating Advanced Policy-Based Routing Rules” on page 662](#).
- Edit, clone, or delete the rule. Hover over the rule name and click a specific icon to edit, clone, or delete a rule.

Field Descriptions

[Table 222 on page 661](#) provides guidelines on using the fields on the Rules page.

Table 222: Fields on the Rules Page

Field	Description
Source	Specifies the source zone (to-zone) that defines the context for the policy.
Application	Specifies the application that is associated with the rule for matching.
Routing Instance	Specifies a specific routing instance to which the device sends the matched packets.
Rule Name	Specifies the name of the rule.

Creating Advanced Policy-Based Routing Rules

Use this page to configure rules for an advanced policy-based routing (APBR) profile (also known as an application profile). You can then associate the rules with one or more than one applications (example: for HTTP) or application groups.

To create a rule:

1. Select **Configure > Application Routing Policies**.

The Application Routing Policies page appears.

2. Click the policy name or rules.

The Rules page appear.

3. Click the add icon (+).

4. Complete the configuration according to the guidelines provided in [Table 223 on page 662](#).

5. Click **Save**.

The rules you configured are associated with the selected policy.

Table 223: Fields on the Rule Page

Fields	Description
Source	<p>Click the add icon (+) to select a source zone from the list.</p> <p>You can select one or more zones for the application profile.</p>
Application	<p>Click the add icon (+) to select the application from the list.</p> <p>If the application matches any of the application or application groups of a rule in a profile, the application profile rule is considered as a match.</p> <p>You can select one or more applications.</p>
Routing Instance	<p>Click the + icon to select a routing instance from the list, that are configured on a device. The device sends the matched packet to the specified routing instance. The routing instances specify the routing table and the destination to which a packet is forwarded.</p> <p>When traffic arrives at the specified zone, it is matched by the advanced application profile. The application profile matches applications and application groups and if the matching rule is found, the packets are routed to the routing instance that sends the traffic to a different interface as specified in the next-hop IP address.</p>

Table 223: Fields on the Rule Page (continued)

Fields	Description
Rule Name	The rule name is automatically generated by Security Director. For example, Rule- <i>incremental value</i> .

NOTE: An APBR policy designed in Security Director is equal to one or more policies on a device, based on the unique security zones and rule set.

RELATED DOCUMENTATION

About the App Based Routing Page

To access this page, select **Monitor > App Based Routing**.

You can use the App Based Routing page to monitor the APBR profile data. You can view information on the link utilization of an application for a selected duration, top ten applications using the app based routing, list of devices, and a step graph showing how many times an application took an APBR path and a default path.

Tasks You Can Perform

You can perform the following task from this page:

- Monitor the overall link usage, device level utilization of link usage, and step graph representation of application routing information.

Field Descriptions

[Table 224 on page 664](#) provides guidelines on using the widgets on the App Based Routing page.

Table 224: Widgets on the App Based Routing Page

Widget	Description
Top 10 Applications	Shows top ten applications with their throughput in Mbps.
Preferred vs Default Link Usage	<p>Shows a graphical representation for how long an application took APBR path and default path, for a selected duration. The data is shown for all devices.</p> <p>By default, the result is shown for all applications. To view the result for any particular application, select the application from the Apps list. You can also choose the time period.</p>
Devices List	<p>Shows list of devices assigned with the APBR profile.</p> <p>Click on the device name to view more details on the link usage and other information about APBR at the device level, as described in Table 225 on page 664.</p>

Table 225: Widgets for the Selected Device

Widget	Description
Links	Shows a graphical representation of different interfaces of a device and applications using those interfaces.
Top 10 Applications	Shows top 10 applications with the most sessions for the selected time period.
Link Utilization	<p>Select a required interface from the list and view the link utilization data by different applications.</p> <p>You can filter the data for a different time period.</p>
App Routing: Preferred vs Default Link Usage	Shows a graphical representation for how long an application took APBR path and default path, for a selected duration. This data is shown for the selected device.
Preferred vs Default Link Usage	Shows an overall statistics of all applications taking the APBR path and default path, for a selected duration. The data is shown for the selected device.

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

RELATED DOCUMENTATION

Assigning Devices to Policies

Once you create a group or device policy, you can assign devices to it.

To assign devices to a policy:

1. Select **Configure >Policy-Name Policy> Policies**.

The Policies landing page appears.

2. Right-click the policy to which you want to assign devices, or select **Assign Devices** from the More menu.

The Assign Devices page appears. The Name field shows the name of the selected policy and is not editable.

3. Select the **Show only devices without policy assigned** check box.

Only devices that are not assigned to any policy are displayed in the Device Selection section.

4. Select the devices you want to add to the policy from the Available column and click the right arrow to move these devices to the Selected **column**.

NOTE: There is an option to search for devices in the Selected column on the Assign Devices page. By default, all selected devices are sorted in a list and you can search for devices again, if required.

5. Click **OK** to assign the selected devices to the selected **policy**.

NOTE: If you do not have permission to certain devices, those devices are not visible while assigning devices to a new or existing policy.

RELATED DOCUMENTATION

[Creating NAT Policies | 567](#)

Customizing Profile Names

You can customize the profile names, which are automatically generated by Security Director. Each automatically created profile contains rules and these rules are associated to a zone. For example, you add two rules to an application-based policy and assign the rules to zone 10 and add the third rule and assign it to zone 11, then the first two rules are automatically created as one profile and the third rule is automatically created as another profile.

To customize the profile names:

1. Select **Configure > Application Policy Based Routing**.

The Application Policy Based Routing page is displayed.

2. Right-click the policy name for which you want to customize the profile or select **Configure profile** from the **More** menu.

The Configure profile page is displayed. It displays the zones configured on the rules and the profile name.

3. Click the profile name and enter the customized profile name.
4. Click **OK** to customize the profile names.

RELATED DOCUMENTATION

[Configuring Advanced Policy-Based Routing Policy | 659](#)

[Creating Advanced Policy-Based Routing Rules | 662](#)

Publishing Policies

When you publish rules, the process takes into account the priority and precedence values set on the policy and the order of rules on the device. Rules are published in the order of their priority groups, with prerules in the High priority group publishing first, before prerules in the Medium and Low priority groups.

If you change the priority or precedence of a published policy, the policy must be republished for the changes to take effect. Sometimes, changing priority or precedence in one policy can affect other policies in the same priority group. However, such policies do not need to be republished in order for their changes in priority or precedence to take effect for the policies that are implicitly changed by the explicit changes to the republished policy.

To publish a policy:

1. Select **Configure > Policy-Name Policy > Policies**.
2. Select the policy that you want to publish and click **Publish**. The Publish Policy page appears.
3. Select the check boxes next to the devices to which the policy changes will be published.

NOTE: You can search for a specific device on which the policy is published by entering the search criteria in the search field. You can search the devices by their name and IP address.

4. Select **Schedule at a later time** if you want to schedule and publish the configuration later.
5. Select **Run now** if you want to apply the configuration immediately.
6. Click **Publish**. The Affected Devices page displays the devices on which the policies will be published.

RELATED DOCUMENTATION

[Creating IPS Policies | 507](#)

[Creating NAT Policies | 567](#)

[Updating Policies on Devices | 385](#)

Updating Policies on Devices

When you finish creating and verifying your security configurations, you can publish these configurations and keep them ready to be pushed to the security devices. Security Director helps you push all the security configurations to the devices all at once by providing a single interface that is intuitive.

The Publish workflow provides the ability to save and publish different services to be updated at a later time to the appropriate firewalls (during the down time). This permits administrators to review their firewall, VPN, and NAT policies before updating the device. This saves administrators troubleshooting time, avoid errors, and saves costs associated with errors. Verify and tweak your security configurations before updating them to the device by viewing the CLI and XML version of the configuration in the Publish workflow. This approach helps you keep the configurations ready and update these configurations to the devices during the maintenance window.

When you publish rules, the process takes into account the priority and precedence values set on the policy and the order of rules on the device. Rules are published in the order of their priority groups, with prerules in the High priority group publishing first, before prerules in the Medium and Low priority groups.

If you change the priority or precedence of a published policy, the policy must be republished for the changes to take effect. Sometimes, changing priority or precedence in one policy can affect other policies in the same priority group. However, such policies do not need to be republished in order for their changes in priority or precedence to take effect for the policies that are implicitly changed by the explicit changes to the republished policy.

To update a policy:

1. Select **Configure > Policy-Name Policy > Policies**. Select the policy that you want to update and click **Update**. The Update Policy page appears.
2. Select the policy that you want to update and click **Update**. The Update Policy page appears.
3. Select the check boxes next to the devices to which the policy changes will be published.

NOTE: You can search for a specific device on which the policy is published by entering the search criteria in the search field. You can search the devices by their name and IP address.

4. Select **Schedule at a later time** if you want to schedule and publish the configuration later.
5. Select **Run now** if you want to apply the configuration immediately.
6. Click **Publish**. The Affected Devices page displays the devices on which the policies will be published.

Threat Prevention - Policies

IN THIS CHAPTER

- [Creating Threat Prevention Policies | 671](#)
- [Threat Prevention Policy Overview | 677](#)
- [Threat Policy Analysis Overview | 679](#)
- [Implementing Threat Policy on VMWare NSX | 680](#)

Creating Threat Prevention Policies

To access this page, select **Configure>Threat Prevention > Policy**.

You can create threat prevention policies from the policy page.

NOTE: If you are creating policies for the first time, you are given the option of setting up Policy Enforcer with Sky ATP or configuring Sky ATP alone. Clicking either button takes you to quick setup for your selection. See [“Comparing the SDSN and non-SDSN Configuration Steps” on page 855](#) for a configuration comparison.

- Determine the type of profile you will use for this policy; command & control server, infected hosts, malware. You can select one or more threat profiles in a policy. Note that you configure Geo IP policies separately. See [“Creating Geo IP Policies” on page 765](#).
- Determine what action to take if a threat is found.
- Know what policy enforcement group you will add to this policy. To apply the policy, you must assign one or more policy enforcement groups. See the instructions for assigning groups to policies at the bottom of this page.
- Once policies are configured with one more groups assigned, you can save a policy in draft form or update it. Policies changes do not go live until they have been updated.

- If you are using Sky ATP without Policy Enforcer, you must assign your threat prevention policy to a firewall rule for it to take affect. See the instructions at the bottom of this page.
- If you delete a threat prevention policy that is assigned to a policy enforcement group, a status screen appears displaying the progress of the deletion and the affected configuration items.

To create a threat prevention policy:

1. Select **Configure>Threat Prevention > Policy**.

2. Click the + icon.

The Create Threat Prevention Policy page appears.

3. Complete the configuration by using the guidelines in the [Table 226 on page 672](#), [Table 227 on page 672](#), [Table 228 on page 673](#), [Table 229 on page 674](#), and [Table 230 on page 675](#) below.

4. Click **OK**.

Table 226: Fields on the Threat Prevention Policy Page

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.
Log Setting (Policy setting for all profiles)	Select the log setting for the policy. You can log all traffic, log only blocked traffic, or log no traffic.

[Table 227 on page 672](#) shows the management of command and control server threat in a policy.

Table 227: C&C Server Profile Management

Field	Description
Command and Control Server	Select and choose settings for command and control servers. A C&C is a centralized computer that issues commands to botnets (compromised networks of computers) and receives reports back from them. Botnets can be used to gather sensitive information, such as account numbers or credit card information, or to participate in a distributed denial-of-service (DDoS) attack.
<i>Include C& C profile in policy</i>	Select the check box to include management for this threat type in the policy.

Table 227: C&C Server Profile Management (*continued*)

Field	Description
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. Refer to the monitoring pages in the UI to investigate, located under Monitor > Threat Management .
Actions	<p>If the threat score is high enough to cause a connection to be blocked, you have following configurable options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Close connection and do not send a message <ul style="list-style-type: none"> • Close connection and redirect to URL—In the field provided, enter a URL to redirect users to when connections are dropped. • Send custom message—In the field provided, enter a message to be shown to users when connections are dropped.

Table 228 on page 673 shows the management of infected host threat in a policy.

Table 228: Infected Host Profile Management

Field	Description
Infected Host	Infected hosts are systems for which there is a high confidence that attackers have gained unauthorized access. Infected hosts data feeds are listed with the IP address or IP subnet of the host, along with a threat score.
<i>Include infected host profile in policy</i>	<p>Select the check box to include management for this threat type in the policy.</p> <p>NOTE: If you want to enforce an infected host policy <i>within</i> the network, you must include a switch in the site.</p>
Actions	<p>You have following options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Quarantine—In the field provided, enter a VLAN to which quarantined files are sent. (Note that the fallback option is to block and drop the connection silently.)

Table 229 on page 674 shows the management of malware threat in a policy.

Table 229: Malware Threat Profile Management

Field	Description
Malware (HTTP file download, SMTP File attachment, and IMAP attachments)	Malware is files that are downloaded by hosts or received as email attachments and found to be suspicious based on known signatures, URLs, or other heuristics.
<i>Include malware profile in policy</i>	Select the check box to include management for this threat type in the policy.
HTTP file download	Turn this feature on to scan files downloaded over HTTP and then select a file scanning device profile. The device profile is configured using Sky ATP.
Scan HTTPS	Turn this feature to scan encrypted files downloaded over HTTPS.
Device Profile	Select a Sky ATP device profile. This is configured through Sky ATP. Sky ATP profiles let you define which files to send to the cloud for inspection. You can group types of files to be scanned together under a common name and create multiple profiles based on the content you want scanned. <i>Device Profiles Overview</i> .
Actions	<p>If the threat score is high enough to cause a connection to be blocked, you have following configurable options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Close connection and do not send a message <ul style="list-style-type: none"> • Close connection and redirect to URL—In the field provided, enter a URL to redirect users to when connections are dropped. • Send custom message—In the field provided, enter a message to be shown to users when connections are dropped.
SMTP File Attachments	Turn this feature on to inspect files received as email attachments (over SMTP only).
Scan SMTPS	<p>Enable this option to configure reverse proxy for SMTP.</p> <p>The reverse proxy does not prohibit server certificates. It forwards the actual server certificate or chain as is to the client without modifying it.</p>
Device Profile	<p>If you do not click the Change button to select a device profile for SMTP scanning, the device profile selected for HTTP will be used by default.</p> <p>Select Change to use a different device profile for SMTP.</p> <p>Device profiles are configured through Sky ATP and define which files to send to the cloud for inspection.</p>

Table 229: Malware Threat Profile Management (*continued*)

Field	Description
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. This threat score applies to all malware, HTTP and SMTP. (Note: There is no monitoring setting for malware.)
Actions	Actions for SMTP File Attachments include: Quarantine, Deliver malicious messages with warning headers added, and Permit. This actions are set in Sky ATP. Refer to the Sky ATP documentation for information.
IMAP Attachments	Turn this feature on to select a a file scanning device profile and threat score ranges to apply to IMAP e-mails.
Scan IMAPS	Enable this option to configure reverse proxy for IMAP e-mails.
Device Profile	<p>If you do not click the Change button to select a device profile for IMAP scanning, the device profile selected for HTTP will be used by default.</p> <p>Select Change to use a different device profile for IMAP.</p> <p>Device profiles are configured through Sky ATP and define which files to send to the cloud for inspection.</p>
Actions	Actions for IMAP Attachments include: Block, Deliver malicious messages with warning headers added, and Permit. This actions are set in Sky ATP. Refer to the Sky ATP documentation for information.
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. This threat score applies to all malware, HTTP, SMTP, and IMAP. (Note: There is no monitoring setting for malware.)

Table 230 on page 675 shows the management of DDoS threat in a policy

Table 230: DDoS Threat Profile Management

Field	Description
<i>Include DDoS Profile in Policy</i>	<p>Enable this option to include the management of Distributed denial-of-service (DDoS) protection that enables the MX router to quickly identify an attack and prevent a flood of malicious control packets from exhausting system resources.</p> <p>When you create a threat policy for the DDoS profile, it is not pushed to the device because the policy is not yet assigned to any device. Assign the policy to the policy enforcement group. Because the policy is created for the MX router, rule analysis is not initiated when a policy is assigned to the policy enforcement group (PEG).</p>

Table 230: DDoS Threat Profile Management (*continued*)

Field	Description
Actions	<p>Select the following actions from the list for the DDoS profile:</p> <ul style="list-style-type: none"> • Block—Use this option to block the DDoS attack. • Rate Limit Value—Use this option to limit the bandwidth on the flow route. You can express the rate limit value in Kbps, Mbps, or Gbps units. The rate limit range is 10Kbps to 100Gbps. • Forward to—Use this option to configure the routing next hop to forward the packets for scrubbing.
Scrubbing Site	Specify a routing instance to which packets are forwarded in the <i>as-number:community-value</i> format, where each value is a decimal number. For example, 65001:100.

Once you have a threat prevention policy, you assign one or more groups to it:

1. In the threat prevention policy main page (located under **Configure > Threat Prevention > Policy**), find the appropriate policy.
2. In the Groups column, click the **Assign to Groups** link that appears here when there are no policy enforcement groups assigned or click the group name that appears in this column to edit the existing list of assigned groups. You can also select the check box beside a policy and click the **Assign to Groups** button at the top of the page. See [“Policy Enforcement Groups Overview” on page 771](#).
3. In the Assign to Groups page, select the check box beside a group in the Available list and click the > icon to move it to the Selected list. The groups in the Selected list will be assigned to the policy.
4. Click **OK**.
5. Once one or more policy enforcement groups have been assigned, a **Ready to Update** link appears in the Status column. You must update to apply your new or edited policy configuration. Clicking the Ready to Update link takes you the Threat Policy Analysis page. See [“Threat Policy Analysis Overview” on page 679](#). From there you can view your changes and choose to Update now, Update later, or Save them in draft form without updating.
6. If you are using Sky ATP without Policy Enforcer, you must assign your threat prevention policy to a firewall rule for it to take affect. Navigate to **Configure > Firewall Policy > Policies**. In the Advanced Security column, click an item to access the Edit Advanced Security page and select the threat prevention policy from the **Threat Prevention** pulldown list.

Threat Prevention Policy Overview

Threat prevention policies provide protection and monitoring for selected threat profiles, including command and control servers, infected hosts, and malware. Using feeds from Sky ATP and optional custom feeds that you configure, ingress and egress traffic is monitored for suspicious content and behavior. Based on a threat score, detected threats are evaluated and action may be taken once a verdict is reached.

Once policies are configured, the following fields are available on the Security Director main page to provide an overview of each policy.

Table 231: Threat Prevention Policy Fields

Field	Description
Name	The user-created name for the policy.
Profile: C&C Server	Threat score settings overview if selected for the policy. (Otherwise this field is empty.) For example: Block: 8-10 Monitor: 5-7 Permit: 1-4
Profile: Infected Host	Threat score settings overview if selected for the policy. (Otherwise this field is empty.)
Profile: Malware HTTP	Threat score settings overview if selected for the policy. (Otherwise this is empty.)

Table 231: Threat Prevention Policy Fields (continued)

Field	Description
Profile: Malware SMTP	Threat score settings overview if selected for the policy. (Otherwise this field is empty.)
Status	<p>This displays the status of the policy. This status is a clickable link you can use to change the policy status. When you first create a policy and assign it to a group, this field reads View Analysis. Read “Threat Policy Analysis Overview” on page 679 for more information on this field.</p> <p>If the status is Update Failed, click Retry to perform the rule analysis again. You can click the Update Failed status to see the corresponding job details. The rule analysis retry option is available only when the status is Update Failed.</p> <p>NOTE: If the policy has been updated after it has already been pushed to the endpoint, the status here is Update with a warning icon to notify you the policy has been changed but not pushed.</p>
Policy Enforcement Group	This is the group to which the policy is assigned.
Log	This field displays the log setting for the policy.
Description	The user-created description for the policy.

Benefits of Threat Prevention Policy

- Enables you to define and enforce policies for controlling specific applications and embedded social networking widgets.
- Reduces the need for manual updates and automatically applies policies and enforcement rules, driving down the costs of managing network security.
- Leverages the network for multiple enforcement points across the infrastructure. Enables you to stop threats closer to infection points and to prevent threats from spreading, which greatly improves the efficacy of security operations.

Threat Policy Analysis Overview

To access this page, click **Configure>Threat Prevention > Policy** and click the **Ready to Update** link in the Status column.

You can update policy changes from this page. Policies must be updated before they can go live.

NOTE: If the policy has been updated after it has already been pushed to the endpoint, the status here is **Update** with a warning icon to notify you the policy has been changed but not pushed.

Use the threat policy analysis page to view your pending policy changes in chronological order. Click the **View Analysis** link to view the changes. In the Action section, you can select to Update now, Update later, or Save the changes without updating. If you select to update later, you can schedule a time to update.

By clicking on the policy links, you can update only the policies you select and choose not to update others.

VMWare NSX Integration with Policy Enforcer and Sky ATP Overview

Juniper Networks Sky Advanced Threat Prevention (Sky ATP) identifies the infected virtual machines (VMs) running on VMWare NSX and tags these VMs as infected. This is based on a malware file exchange from the infected VMs and/or based on the Command and Control communication with known botnet sites on the internet.

Based on this identification of infected or compromised hosts, you can take one of the following actions:

- Enable additional security features such as Layer-7 Application Firewall and Intrusion Prevention (IPS) leveraging vSRX
- Enforce Layer-2 to Layer-4 controls using NSX Distributed Firewall
- Leverage NSX integration with Host-Based security vendors (<https://www.vmware.com/products/nsx/technology-partners.html>) to take host-based security actions such as running antivirus or anti malware features on the infected VMs.

Policy Enforcer provides a set of Connector APIs for the third-party adaptors. The NSX Connector integrates with the Policy Enforcer using these APIs to enable enforcement of the infected hosts policy on Secure Fabric. For NSX connectors, the NSX Manager, its associated vCenter, and an edge firewall form the Secure Fabric.

The following topology shows how NSX Manager and the edge firewall create a Secure Fabric to use with Policy Enforcer.

Figure 55: Topology of NSX Integration with Policy Enforcer

Within the NSX Manager, the virtual machines (VM) connect to logical networks, shown as green and yellow colour logical networks, as shown in [Figure 55 on page 681](#). The logical switches connect to each other using a Distributed Logical Router(DLR). To form the Secure Fabric, configure the edge service gateway (ESG) to point to SRX Series devices or vSRX as the gateway for the networks hosted on NSX. This is implemented by establishing IBGP session between ESG and vSRX or SRX Series device. This ensures that all the north-south traffic passes through the vSRX edge firewall. The vSRX edge gateway is enrolled with Sky ATP for the traffic inspection.

If NAT services are required, it must be configured on the vSRX and not on the ESG. Configure NAT services using the following CLI commands.

```
set security nat source rule-set trust-to-untrust from zone trust
```

```
set security nat source rule-set trust-to-untrust to zone untrust
```

```
set security nat source rule-set trust-to-untrust rule snat-rule match source-address 0.0.0.0/0
```

```
set security nat source rule-set trust-to-untrust rule snat-rule then source-nat interface
```

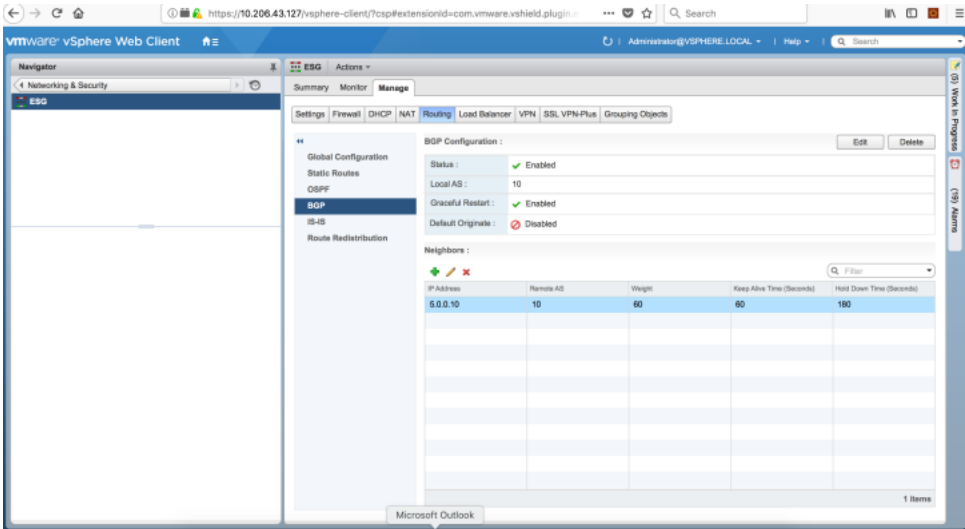

To establish a BGP session, use the following configuration commands:

```
set routing-options autonomous-system 10
```

```
set protocols bgp group nsx neighbor 5.0.0.2 peer-as 10
```

You can view the BGP configuration in VMWare vCenter Server, as shown in [Figure 56 on page 682](#).

Figure 56: VMWare vCenter BGP Configuration

NOTE: You can register the NSX Manager with Security Director only when the Policy Enforcer is configured. The NSX micro service is bundled with the Policy Enforcer VM. However, the NSX micro service is packaged as a standalone rpm, so that the NSX micro service upgrade and patches can be performed independent of the Policy Enforcer VM.

Implementation of Infected Hosts Policy Overview

The vSRX or SRX Series devices running as an edge firewall is enrolled to send all the suspected traffic to Sky ATP.

The following steps explain the high-level workflow:

- If an infection is detected, Sky ATP notifies the Policy Enforcer about the infected IP addresses
- If the infected IP address belongs to Secure Fabric associated with the NSX domain, Policy Enforcer calls the NSX plugin APIs to notify the NSX Connector about the list of infected IP addresses
- NSX service will then retrieve the VM corresponding to the IP addresses sent and then calls the NSX API to tag to an appropriate VM with a security tag, SDSN_BLOCK.

You can then create a policy to block the infected hosts using the SDSN_BLOCK tag by creating VMWare Distributed Firewall (DFW) rules. The block policy consists of two rules for ingress block and egress block. The ingress block rule applies to any traffic originating from a security group composed of VMs tagged with a block tag to any destination. Similarly, the egress block rule applies to any traffic destined to security group composed of VMs tagged with block tag from any source.

The creation of security groups associated with the SDSN_BLOCK tag, creation of ingress and egress block rules, and the action to take on the matching packets must be configured by the VMWare administrators. The NSX Connector will simply apply the SDSN_BLOCK tag on the infected VM.

Registering NSX Micro Service as Policy Enforcer Connector Instance Overview

The integration of each NSX manager discovered in Security Director with Policy Enforcer is triggered automatically.

The automatic registration of a connector instance involves the following steps:

1. Discovering the NSX Manager in Security Director. This triggers an auto creation of the Policy Enforcer connector instance.
2. Secure Fabric is created to manage the discovered NSX Manager.
3. Creation of threat prevention policy requires the knowledge of Sky ATP realm and the edge firewall device. These are taken as inputs from the user.

Before You Begin

IN THIS SECTION

- [Infected Hosts Workflow in VMware vCenter Server | 683](#)

Before you begin to configure NSX with Policy Enforcer, configure the infected hosts workflow in VMWare vCenter Server.

Infected Hosts Workflow in VMware vCenter Server

To block the infected hosts:

1. Log in to the vSphere Web Client through the VMware vCenter Server.
2. From the vSphere Web Client, click **Networking & Security** and then click **NSX Managers**.

Under the Manage section, click **Security Tags** column head and create SDSN_BLOCK security tag for NSX, as shown in [Figure 57 on page 684](#).

Figure 57: SDSN_BLOCK Security Tag

- The feed for the infected hosts will be triggered by Sky ATP down to Policy Enforcer. When there is a trigger, the SDSN_BLOCK tag is attached to the VM. Click on the VM Count column to see the VM details attached to the tag.
3. Select **Networking & Security** and then click **Service Composer**.
The Service Composer page appears. From the Service Composer, click the **Security Groups** tab. The security administrator can create the security group based on the security tag.
 4. Click the **New Security Group** icon to create a new security group.
 5. Enter a name and description for the security group and then click **Next**.
 6. On the Define dynamic membership page, define the criteria that an object must meet for it to be added to the security group you are creating.
In the Criteria Details row, select **Security Tag** from the list and provide the SDSN_BLOCK tag name, as shown in [Figure 58 on page 685](#).

Figure 58: Define Dynamic Membership Page

Edit Security Group

- ✓ 1 Name and description
- ✓ 2 Define dynamic membership
- ✓ 3 Select objects to include
- ✓ 4 Select objects to exclude
- ✓ 5 Ready to complete

Define dynamic membership

Specify dynamic membership criteria that objects must meet to be part of this security group.

+

Membership criteria 1

Match: Any of the criteria below

Criteria Details

Add

Security Tag Co... SDSN_BLOC X

Back Next Finish Cancel

Click **Next**.

7. In the Ready to Complete page, verify the parameters and click **Finish**.

In the Service Composer page, under the Security Groups tab, you can see that the security group has been created and the VM with the security tag is assigned to the security group.

Configuring VMware NSX with Policy Enforcer

The following steps explain configuring VMWare NSX with Policy Enforcer:

1. Add the NSX Manager to the Security Director database, as shown in [Figure 59 on page 686](#). To know more about adding a NSX Manager, see [“Adding the NSX Manager” on page 323](#).

Figure 59: Adding NSX Manager Page

Add NSX Manager ⓘ

1 NSX Manager 2 Service Manager Registration 3 vCenter Server

Name * ⓘ NSX-134

Host * ⓘ

Port * ⓘ 443

Username * ⓘ admin

Password * ⓘ

Issuer: CN=NSX, ST=VA, C=US

Accept SSL Certificate * ⓘ ☒

Cancel Next

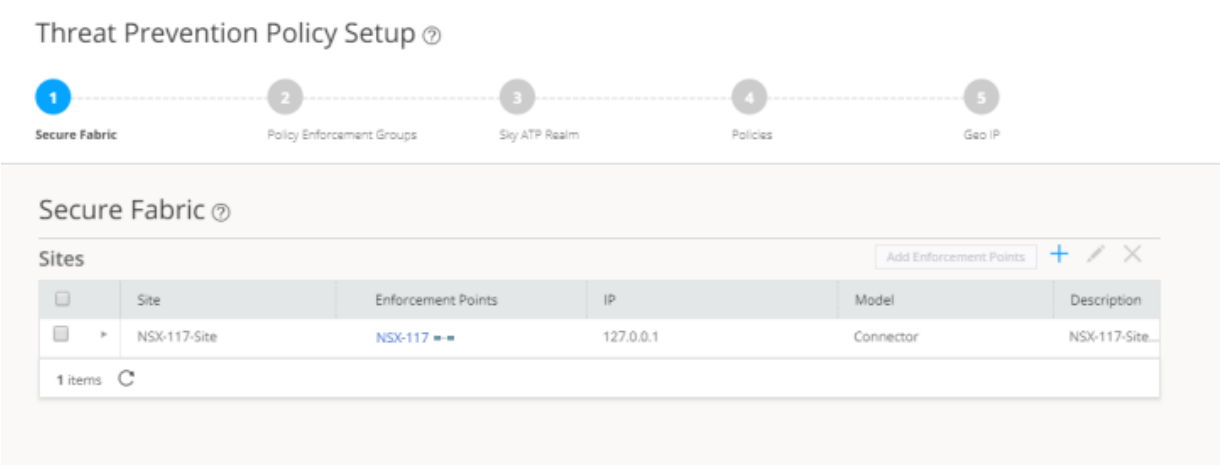

2. After discovering the NSX Manager in Security Director, use the Guided Setup workflow to configure the following parameters:
 - Secure Fabric
 - Policy Enforcement Group (PEG)
 - Sky ATP Realm
 - Threat policies for the following threat types:
 - Command and Control (C&C) Server
 - Infected Hosts
 - Malware
3. Select **Configuration > Guided Setup > Threat Prevention**.

The Threat Prevention Policy Setup page appears.

4. Click **Stat Setup**.

The Threat Prevention Policy Setup page appears, as shown in [Figure 60 on page 687](#). Some of the resources are already configured as you discover the NSX Manager.

Figure 60: Guided Setup Page

5. In the Secure Fabric page, the site is already created. For that site, one enforcement point is also added.

To create a secure fabric site in Policy Enforcer for NSX based environment, you require two parts : NSX Manager and edge firewall. In the Add Enforcement Points page, add vSRX, as shown in the topology, as a edge firewall. Select the vSRX device listed under the Available column and move it to the Selected column. You now have two enforcement points within the Secure Fabric.

Click **Next**.

6. In the Policy Enforcement Groups page, the policy enforcement group is already created based on the Location Group Type. The location points to the Secure Fabric site created for NSX.

Click. **Next**.

7. In the Sky ATP Realm page, associate the Secure Fabric with a Sky ATP realm.

If the Sky ATP realm is already created, click **Assign Sites** in the Sites Assigned column and chose the Secure Fabric site. The Sky ATP realm and Secure Fabric are now associated.

Click. **Next**.

8. In the Policies page, create a threat prevention policy by choosing the profile types depending on the type of threat prevention this policy provides (C&C Server, Infected Host, Malware) and an action for

the profile. The DDoS profile is not supported by the NSX Connector. Once configured, you apply policies to PEGs.

Click **Assign groups** in the Policy Enforcement Group column to associate the policy enforcement group with the policy.

Security Director takes the snapshot of the firewall by performing the rule analysis and threat remediation rules are pushed into the edge firewall.

Click **Finish**.

NOTE: The GeolP feeds are not used with the NSX Connectors.

9. The last page is a summary of the items you have configured using quick setup. Click **OK** to be taken to the Policies page under Configure > Threat Prevention > Policies and your policy is listed there.

Example: Creating a Firewall Rule in VMWare vCenter Server Using SDSN_BLOCK Tag

The following example shows the firewall rule creation using the SDSN_BLOCK security tag:

1. Log in to the vSphere Web Client through the VMware vCenter Server.

2. Select **Networking & Security** and then click **Service Composer**.

The Service Composer page appears.

3. Select **Security Policies** tab in the Service Composer page.

Create a security policy to block the traffic coming from the infected hosts.

4. Select the **Create Security Policy** icon.

The New Security Policy page appears.

5. Enter a name and description for the security policy, and click **Next**.

6. Select the **Firewall Rules** option from the left pane.

The Firewall Rules page appears.

7. Select the New Firewall Rule icon (+) to create a new firewall rule.

The New Firewall Rule page appears.

8. Enter the name of the firewall rule.
 9. In the Action field, select the **Block** option.
 10. In the Source field, click **Change** and select the security group.
 11. In the Destination field, click **Change** and select the security group to add as Any.
- Click **Ok**. [Figure 61 on page 689](#) shows a sample firewall rule configuration.

Figure 61: New Firewall Rule Page

New Firewall Rule

Name:

Description/Comments:

Action: ☐ Allow ☒ Block ☐ Reject

Source: Policy's Security Groups [Change...](#)
☐ Negate source

Destination: Any [Change...](#)
☐ Negate destination

i Either source or destination selection (or both) must be "Policy's Security Groups". Current selection will apply to "Outgoing" traffic from the security groups where this policy gets applied to specified Destination.

Service: Any [Change...](#)

State: ☒ Enabled ☐ Disabled

Log: ☐ Log ☒ Do not log

OK **Cancel**

12. Click **Finish**.
- A new policy is created. You can apply this policy to the security group.
13. In the Security Policies page, right-click on the policy name and select **Apply Policy**.
- The Apply Policy to Security Groups page appears, as shown in [Figure 62 on page 690](#).

Figure 62: Apply Policy to SG Page

14. Select the security group that you have created and assign to a policy.
- Security administrator is now able to block the traffic coming from the infected hosts.

Threat Prevention - Sky ATP Realms

IN THIS CHAPTER

- Sky ATP Realm Overview | 691
- Creating Sky ATP Realms and Enrolling Devices or Associating Sites | 692
- Modifying Sky ATP Realm | 694

Sky ATP Realm Overview

A security realm is a group identifier for an organization used to restrict access to Web applications. You must create at least one security realm to login into Sky ATP. Once you create a realm, you can enroll SRX Series devices into the realm. You can also give more users (administrators) permission to access the realm.

If you have multiple security realms, note that each SRX Series device can only be bound to one realm, and users cannot travel between realms.

[Table 232 on page 691](#) provides the guidelines on using the fields on the Sky ATP Realm page.

Table 232: Fields on the Sky ATP Realm Page

Field	Description
Realm	Specifies the name of a realm.
Sites	Specifies the site name associated to the realm.
Location	Specifies the region of the realm.
Devices	Specifies the perimeter firewall devices that are enrolled to Sky ATP.
Enrollment Status	Specifies the enrollment status of the realm.

RELATED DOCUMENTATION

[Using Guided Setup for Sky ATP | 940](#)

[skyConfiguring Sky ATP \(No SDSN and No Guided Setup\) Overview | 970](#)

Creating Sky ATP Realms and Enrolling Devices or Associating Sites

To access this page, click **Configure>Threat Prevention>Sky ATP Realms**.

You can create Sky ATP realms from the Sky ATP page.

- Understand which type of Sky ATP license you have: free, basic, or premium. The license controls which Sky ATP features are available.
- To configure a Sky ATP realm, you must already have a Sky ATP account with an associated license.
- Ensure that the internet connectivity is available for Policy Enforcer. Without the internet connectivity, you cannot create a realm.
- Decide which region will be covered by the realm you are creating. You must select a region when you configure a realm.
- Note that adding a device to a realm results in one or more commit operations occurring on the device to apply the Sky ATP or Policy Enforcer configuration.

To configure a Sky ATP Realm:

1. Select **Configure>Threat Prevention>Sky ATP Realms**.
2. Click the + icon.
3. Complete the initial configuration by using the guidelines in [Table 233 on page 693](#) below.

Table 233: Fields on the Add Sky ATP Realm Page

Field	Description
Location	<p>Select a region of the world from the available choices.</p> <p>The following options are available in the Location list:</p> <ul style="list-style-type: none"> • North America • European Region • Canada • Asia Pacific <p>By default, the North America value appears in the list. To know more about the geographic region, see here.</p>
Username	Enter your e-mail address. Your username for Sky ATP is your e-mail address.
Password	Enter a unique string at least 8 characters long. Include both uppercase and lowercase letters, at least one number, and at least one special character (~!@#\$%^&*()_+={}[] ;:<>./?); no spaces are allowed, and you cannot use the same sequence of characters that are in your username.
Realm	<p>Enter a name for the security realm. This should be a name that is meaningful to your organization. A realm name can only contain alphanumeric characters and the dash symbol. Once created, this name cannot be changed.</p> <p>NOTE: When you create a custom feed with a realm, the feed is associated at the site level and not at the realm level. If you modify this realm and associate new sites to it, a warning message is shown that there are custom feeds are associated with this realm. Changing the site information will change the custom feed information. You must go and edit the custom feed that was associated with this realm and verify the realm association.</p>

- Click **Next** and guided setup walks you through the steps for enrolling devices into the realm and associating sites for Policy Enforcer.

The next steps include the following:

- If you are using Sky ATP with PE and you have no devices in enrolled in the realm, you are asked to select devices in the box on the left and move them to the right to enroll them. All selected devices are automatically enrolled with Sky ATP when you finish guided setup. To disenroll a device, you can edit a realm and move the device back to the left side box.

NOTE: Note that adding a device to a realm results in one or more commit operations occurring on the device to apply the Sky ATP or Policy Enforcer configuration.

6. Next you select a Site from the list to contain the devices. If there are no sites associated with the realm, click **Create new site**. See [“Creating Secure Fabric and Sites” on page 304](#).

NOTE: If you are using Sky ATP without PE, you are not prompted to select a site.

7. Once the devices and site are selected, you use the sidebar to choose a threshold level at which selected administrators are notified via email about infected host events. Click the+ sign if you want to add new administrators to the list.
8. Finally, you select one or more check boxes for event types you want to log.
9. Click **Finish**.

NOTE: If you enrolled a device into a realm from within Security Director and you want to disenroll it, you must do that from within Security Director. If you enrolled a device into a realm from within Sky ATP and you want to disenroll it, you must do that from within Sky ATP. You cannot disenroll a device from within Security Directory that was enrolled from within Sky ATP.

RELATED DOCUMENTATION

[Using Guided Setup for Sky ATP](#) | 940

[Creating Secure Fabric and Sites](#) | 304

Modifying Sky ATP Realm

Use the Modify Sky ATP Realm page to modify the site information and global configuration information of an existing Sky ATP realm. You can also view devices from the realm that are not managed by Security Director.

In the Global Configuration section, you can add trusted proxy server IP addresses to Sky ATP. When there is a proxy server between users on the network and a firewall, the firewall might see the proxy server IP address as the source of an HTTP or HTTPS request instead of the actual address of the user making the request.

With this in mind, X-Forwarded-For (XFF) is a standard header added to packets by a proxy server that includes the real IP address of the client making the request. Therefore, if you add trusted proxy servers IP addresses to the list in Sky ATP, by matching this list with the IP addresses in the HTTP header (X-Forwarded-For field) for requests sent from the SRX Series devices, Sky ATP can determine the originating IP address.

NOTE: X-Forwarded-For (XFF) only applies to HTTP or HTTPS traffic, and only if the proxy server supports the XFF header.

To modify a Sky ATP realm:

1. Select **Configure > Threat Prevention > Sky ATP Realms**.
The Sky ATP Realms page appears.
2. Select the realm and click the pencil icon to modify the configuration.
The Modify Sky ATP Realm page appears.
3. Complete the configuration by using the guidelines in [Table 234 on page 695](#).
4. Click **Finish** to complete the configuration or **Cancel** to discard the changes.

NOTE: Assigning a site to the realm will cause a change in the device configuration in the associated devices.

Table 234: Fields on the Modify Sky ATP Realm page

Field	Description
<i>Site</i>	
Site	Select a site to enroll into the realm. If there are no sites associated with the realm, click Create new site .
Unmanaged Devices	Lists all devices from the realm that are not managed in Security Director. You must manually discover them.
<i>Global Configuration</i>	

Table 234: Fields on the Modify Sky ATP Realm page (*continued*)

Field	Description
Threat Level Threshold	Select a threshold level to block the infected hosts and to send an e-mail to the selected administrators notifying about the infected host events.
Logging	Enable logging for the Malware or the Host Status event.
Proxy Servers	<p>Click the add icon (+) to enter the IPv4 address of the proxy server, in the Server IP column.</p> <p>You can also edit the existing IP address or delete them.</p>

Threat Prevention - Custom Feeds

IN THIS CHAPTER

- Custom Feed Sources Overview | 697
- Creating Custom Feeds: Dynamic Address, Whitelist and Blacklist | 698
- Example: Creating a Dynamic Address Custom Feed and Firewall Policy | 704
- Creating Custom Feeds, Infected Host | 706
- Creating Custom Feeds, DDoS | 709
- Configuring TTL Settings for Custom Feeds | 712

Custom Feed Sources Overview

Policy Enforcer uses threat feeds to provide actionable intelligence to policies about various types of threats. These feeds can come from different sources, such as Sky ATP, and from lists that you can customize by adding IP addresses, domains, and URLs.

NOTE: Sky ATP feeds and custom feeds are mutually exclusive. You can only have one source for whitelist, blacklist, and infected host feeds.

The following types of custom threat feeds are available:

- A dynamic address is a group of IP addresses that can be imported from external sources. These IP addresses are for specific domains or for entities that have a common attribute such as a particular undesired location that poses a threat. You can then configure security policies to use the dynamic addresses within a security policy.
- A whitelist contains known trusted IP addresses, URLs, and domains. Content downloaded from locations on the whitelist does not have to be inspected for malware.
- A blacklist contains known untrusted IP addresses, URLs, and domains. Access to locations on the blacklist is blocked, and therefore no content can be downloaded from those sites.
- Infected hosts are hosts known to be compromised.

For threat management policies to use these feeds, you must enter configuration information for each feed type.

Benefits of Custom Feed Sources

- Provides relevant and timely intelligence that you can use to create enforcement policies. Enables you to customize threat feeds specific to your industry or organization.
- Provides flexible mechanisms to synchronize threat information to:
 - Configure Policy Enforcer to poll from local file and remote file custom feeds.
 - Push threat feeds to Policy Enforcer using the Threat Feed API .

RELATED DOCUMENTATION

[Creating Custom Feeds: Dynamic Address, Whitelist and Blacklist | 698](#)

[Creating Custom Feeds, Infected Host | 706](#)

[Example: Creating a Dynamic Address Custom Feed and Firewall Policy | 704](#)

Creating Custom Feeds: Dynamic Address, Whitelist and Blacklist

To access this page, click **Configure>Threat Prevention>Custom Feeds**.

You can create custom feeds from the custom feeds page.

- Know what type of feed you are configuring and have all the necessary information on hand. Local feeds are created on your local system and uploaded from there.
- To use a custom feed, apply it to the source or destination address in a firewall rule. In the firewall rule, you can filter addresses to show Dynamic Addresses.
- For creating an Infected Host custom feed, see [“Creating Custom Feeds, Infected Host” on page 706](#).

For creating a DDoS custom feed, see [“Creating Custom Feeds, DDoS” on page 709](#).

To create local file and remote file custom feeds:

1. Select **Configure>Threat Prevention>Custom Feeds**.
2. Select one of the following feed types.

Table 235: Custom Feed Categories

Feed Category	Definition
Dynamic Address	<p>A dynamic address entry provides dynamic IP address information to security policies. A dynamic address is a group of IP addresses, not just a single IP prefix, that can be imported from external sources. These IP addresses are for specific domains or for entities that have a common attribute such as a particular undesired location that poses a threat. You can then configure security policies to use the dynamic addresses within a security policy.</p> <p>You can use custom feeds while configuring the firewall policy. For information on how to create dynamic addresses, see: Creating Dynamic Address Groups.</p> <p>NOTE: You can create multiple custom feeds for all types of feed categories.</p>
Whitelist	<p>A whitelist contains known trusted IP addresses, URLs, and domains. Content downloaded from locations on the whitelist does not have to be inspected for malware.</p>
Blacklist	<p>A blacklist contains known untrusted IP addresses, URLs, and domains. Access to locations on the blacklist is blocked, and therefore no content can be downloaded from those sites.</p>
Infected Host	<p>Infected hosts are hosts known to be compromised. Enter host IP addresses manually or upload a text file with the IP addresses of infected hosts. See “Creating Custom Feeds, Infected Host” on page 706 for configuration details.</p>
DDoS	<p>Using DDoS threat feed, policy Enforcer blocks source IP addresses in the feed, rate limit the traffic from the source IP addresses, and takes BGP Flowspec action to blackhole or redirect the traffic to scrubbing centers. See “Creating Custom Feeds, DDoS” on page 709 and “Creating Threat Prevention Policies” on page 671.</p>

NOTE:

- The Remote Download Status field shows the status of downloading feeds from a remote file server to Policy Enforcer. This field will be blank if the locally created custom feeds.

The following statuses are shown under different scenarios:

- Pending—Status is shown as pending until Policy Enforcer downloads the new feeds from the remote file server.
- Success—Status is shown as success when Policy Enforcer downloads the feeds successfully.
- Failed—Status is shown as failed when downloading the feeds fails.
- The Days to Become Inactive field shows the number of days within which the custom feed is going to expire or become inactive. You must specify the number of days for each custom feed to be active in the Time to Live (TTL) Settings page. Whenever you make any update to a feed type in the TTL Settings page, number of days to expire is counted from that date. See [“Configuring TTL Settings for Custom Feeds” on page 712](#).

Once the Days to Become Inactive field is zero, the respective feed will become inactive and cannot be used. You must update the feed again to make it active.

3. Click **Create** and select one of the following:

- **Feeds with local files**—This is data you enter manually into the provided fields or upload from a text file on your location machine. See [Table 236 on page 701](#) for details.
- **Feeds with remote file server**—This is a data feed from a remote server. Configure communication with the remote server using instructions in [Table 237 on page 702](#).

4. Complete the configuration by using the guidelines in [Table 236 on page 701](#) or [Table 237 on page 702](#).

5. Click **OK**. Your entry is added to custom list displayed at the bottom of the page.

NOTE: To use a custom feed, apply it to the source or destination address in a firewall rule. In the firewall rule, you can filter addresses to show Dynamic Addresses.

If there is a firewall policy rule created using the dynamic address, you cannot delete the same dynamic address from the Custom Feeds page. You must first delete the firewall policy rule and then, delete the dynamic address from the Custom Feeds page.

Use the fields in [Table 236 on page 701](#) to add custom feeds.

Table 236: Fields on the Custom Feeds Page, Feeds with Local Files

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include only dashes and underscores; no spaces allowed; 32-character maximum.
Description	Enter a description for your custom feed; maximum length is 64 characters. You should make this description as useful as possible for all administrators.
Feed Type	<p>Select one of the following:</p> <ul style="list-style-type: none"> • IP, Subnet and Range—Enter an IPV4 address in standard four octet format. CIDR notation and IP address ranges are also accepted. Any of the following formats are valid: 1.2.3.4, 1.2.3.4/30, or 1.2.3.4-1.2.3.6. • URL and Domain—Enter the URL using the following format: http://yourfeed.com/abc and Domain using the following format: http://yourfeed.com. Wildcards and protocols are not valid entries. <p>NOTE: For Dynamic Address, you can only select IP, Subnet, and Range. For Blacklists and Whitelists, all feed types are available for selection.</p>
Sites	<p>Select the required sites from the list to associate them with the dynamic address or whitelists and blacklists feeds.</p> <p>In the default mode (no Sky ATP), only sites are listed because of no Sky ATP. The same site can be shared across dynamic address, whitelists, and blacklists feeds.</p>
Realms	<p>Select the required realms from the list, if you are in Cloud feeds only, Sky ATP, or Sky ATP with SDSN mode.</p> <p>Associate these realms with dynamic address or whitelists and blacklists feeds. The same realm can be shared across dynamic address, whitelists and blacklists feeds.</p> <p>When you are creating a Sky ATP realm, if you do not assign any sites to it, those realms are not listed here. Only realms with sites associated are listed here.</p>

Table 236: Fields on the Custom Feeds Page, Feeds with Local Files (*continued*)

Field	Description
Custom List	<p>Do one of the following:</p> <ul style="list-style-type: none"> Click Upload File to upload a text file with an IP address list. Click the Add button to include the address list in your custom list. <p>Note that the file must contain only one item per line (no commas or semi colons). All items are validated before being added to the custom list.</p> <p>The file must not contain more than 500 entries. An error message is shown if you try to upload a file containing more than 500 IP addresses. Use the Feeds with remote file server option to upload a file containing more than 500 IP addresses.</p> <ul style="list-style-type: none"> Manually enter your item in the space provided in the Custom List section. To add more items, click + to add more spaces.

Table 237: Fields on the Custom Feeds Page, Feeds with Remote File Server

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include only dashes and underscores; no spaces allowed; 32-character maximum.
Description	Enter a description for your custom feed; maximum length is 64 characters. You should make this description as useful as possible for all administrators.
Feed Type	<p>Select one of the following:</p> <ul style="list-style-type: none"> IP, Subnet and Range—Enter an IPV4 address in standard four octet format. CIDR notation and IP address ranges are also accepted. Any of the following formats are valid: 1.2.3.4, 1.2.3.4/30, or 1.2.3.4-1.2.3.6. URL and Domain—Enter the URL using the following format: http://yourfeed.com/abc and Domain using the following format: http://yourfeed.com. Wildcards and protocols are not valid entries. <p>NOTE: For Dynamic Address, you can only enter IP, Subnet, and Range. For Blacklists and Whitelists, all feed types are available for selection.</p>
Type of Server URL	<p>Select one of the following:</p> <ul style="list-style-type: none"> http https
Server File URL	Enter the URL for the remote file server.

[Custom Feed Sources Overview | 697](#)

[Sky ATP Realm Overview | 691](#)

Example: Creating a Dynamic Address Custom Feed and Firewall Policy

As stated earlier, dynamic addresses provide dynamic IP address information to security policies. A dynamic address entry (DAE) is a group of IP addresses, not just a single IP prefix, that can be entered manually or imported from external sources. The DAE feature allows feed-based IP objects to be used in security policies to either deny or allow traffic based on either source or destination IP criteria. For example, a DAE may contain IP addresses for specific domains or for entities that have a common attribute such as a particular undesired location that poses a threat. When the DAE is updated, the changes automatically become part of the security policy. There is no need to manually update the policy; no configuration commit action is required.

This topic steps you through a simple example of creating a DAE and associating it with a policy. For complete information in creating firewall policies in Security Director, see [Creating Firewall Policies](#). This example is based on Security Director 17.1R1.

1. Click **Configure>Threat Prevention>Custom Feeds**.
2. Click the Dynamic Address tab if it is not already selected, and click **Create > Feeds with local files**.
3. Enter **DAE_example1** as the name.
4. Click the plus sign (+) to add individual entries to the custom list.
5. Add the following IP addresses. See the online help for information on supported formats.
 - 192.0.2.0
 - 192.0.2.1/10
 - 198.51.100.0-198.51.100.5
6. Make sure all entries in the custom list are unchecked and click **OK**.

NOTE: If you have an entry selected, an error message will prompt you to uncheck the item prior to clicking OK.

7. Click **Configure > Firewall Policies > Policies**.

NOTE: This example uses simplistic rules to show how to associate a DAE with a whitelist firewall policy. When creating your own firewall policy, you will have to configure the rules that meet your company's requirements.

8. Click the plus sign (+) to create a new firewall policy.
9. Enter **dynamic_address_test** as the name.
10. Select **All Logging Enabled** from the Profile pull-down menu.
11. Select **Device Policy** as the Type and select a device from the Device pull-down menu.
12. Click **OK**.
After a few seconds, the **dynamic_address_test** policy appears in the list.
13. Click **Add Rule** next to the **dynamic_address_test** policy to start the rule wizard.
14. Enter **dynamic_rule** as the name and click **Next**.
15. In the Source window, select **untrust** from the Zone pulldown menu and click **Select** under the Address(es) field.
16. In the Source Address window, select the **Include Specific** radio button.
17. Select **DAE_example1** in the left table and click the right arrow to move it to the right table. Then click **Next**.
The Source window reappears and **DAE_example1** appears in the address(es) field.
18. In the Destination window, select **trust** from the Zone pulldown menu and click **Next**.
19. In the Advanced Security window, select **permit** from the Rule Action pulldown menu and click **Next**.
20. In the Rule Options window, click **Next** to use the default settings.
21. Click **Select** in the Address(es) section and click the **Include Specifics** radio button.
22. In the Rule Analysis window, select the **Analyze the new rule to suggest a placement to avoid anomalies** checkbox and click **Next**.
After a few seconds, an analysis of your rule appears, including where it should be placed, etc.
23. Click **Finish** and then **OK** to exit the wizard.

24. In the resulting page, click **Save** (located near the top of the window.)

25. Check the checkbox for the **dynamic_rule** policy and click **Publish**.

When you publish rules, the process takes into account the priority and precedence values set on the policy and the order of rules on the device.

Creating Custom Feeds, Infected Host

To access this page, click **Configure>Threat Prevention>Custom Feeds**.

- Note that infected hosts are hosts known to be compromised. For an infected host custom feed, enter host IP addresses manually or upload a text file with the IP addresses of infected hosts.
- If you create a custom infected hosts feed, it will override the SKY ATP infected hosts feed.
- To use a custom feed, apply it to the source or destination address in a firewall rule. In the firewall rule, you can filter addresses to show custom feed types, including infected hosts.
- Note that when Sky ATP only mode is selected as the Threat Prevention Type, the infected host custom feed is not available.
- For creating other custom feed types, see [“Creating Custom Feeds: Dynamic Address, Whitelist and Blacklist” on page 698](#).

WARNING: When you have no Sky ATP Configuration Type selected (No selection), Sky ATP realms are disabled. Because site selection is usually done from the Sky ATP realm page, you must select sites from the Custom Feed - Infected Hosts page when in “No selection” mode. The custom feeds are then downloaded to the devices in the chosen sites. This is the only time site selection is available in the Custom Feeds - Infected Hosts page.

To create local file and remote file custom feeds:

1. Select **Configure>Threat Prevention>Custom Feeds**.
2. Select the **Infected Host** tab.

NOTE: When Sky ATP only is selected as the Threat Prevention Type, the infected host custom feed is not available.

3. Click **Create** and select one of the following:
 - **Feeds with local files**—This is data you enter manually into the provided fields or upload from a text file on your location machine. See [Table 236 on page 701](#) for details.
 - **Feeds with remote file server**—This is a data feed from a remote server. Configure communication with the remote server using instructions in [Table 237 on page 702](#).
4. Complete the configuration by using the guidelines in [Table 236 on page 701](#) or [Table 237 on page 702](#).
5. Click **OK**. Your entry is added to custom list displayed at the bottom of the page.

NOTE: To use a custom feed, apply it to the source or destination address in a firewall rule. In the firewall rule, you can filter addresses to show Infected Hosts, Dynamic Addresses, Whitelists and Blacklists.

Use the fields in [Table 236 on page 701](#) to add custom feeds.

Table 238: Fields on the Custom Feeds Page, Feeds with Local Files

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include colons, periods, dashes, and underscores; no spaces allowed; 63-character maximum.
Description	Enter a description for your custom feed; maximum length is 1,024 characters. You should make this description as useful as possible for all administrators.
Sites	<p>Select the required sites from the list to associate them with the infected feeds.</p> <p>In the default mode (no Sky ATP), only sites are listed because of no Sky ATP. You cannot share the same site across the same feed type. However, you can share a site across different feed types.</p>
Realms	<p>Select the required realms from the list, if you are in Cloud feeds only, or SDSN with Sky ATP only mode and associate them with dynamic address or whitelists and blacklists feeds.</p> <p>You cannot share the same realm across the same feed type. However, you can share a realm across different feed types.</p> <p>When you are creating a Sky ATP realm, if you do not assign any sites it, those realms are not listed here. Only realms with sites associated are listed here.</p>

Table 238: Fields on the Custom Feeds Page, Feeds with Local Files (*continued*)

Field	Description
Custom List	<p>Do one of the following:</p> <ul style="list-style-type: none"> Click Upload File to upload a text file with an IP address list. The uploading file must have the string <i>add</i> at the beginning, followed by the IP addresses. If you want to delete certain IP addresses, enter the string <i>delete</i> followed by the IP addresses to delete. <p>Click the Add button to include the address list in your custom list.</p> <p>Note that the file must contain only one item per line (no commas or semi colons). All items are validated before being added to the custom list.</p> <ul style="list-style-type: none"> Manually enter your item in the space provided in the Custom List section. To add more items, click + to add more spaces. <p>For syntax, enter an IPV4 address in standard four octet format. CIDR notation and IP address ranges are also accepted. Any of the following formats are valid: 1.2.3.4, 1.2.3.4/30, or 1.2.3.4-1.2.3.6.</p>

Table 239: Fields on the Custom Feeds Page, Feeds with Remote File Server

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include colons, periods, dashes, and underscores; no spaces allowed; 63-character maximum.
Description	Enter a description for your custom feed; maximum length is 1,024 characters. You should make this description as useful as possible for all administrators.
Type of Server URL	<p>Select one of the following:</p> <ul style="list-style-type: none"> http https
Server File URL	Enter the URL for the remote file server.
Certificate Upload	<p>Click Browse and select the CA certificate to upload.</p> <p>If you do not upload a certificate for https server URL, a warning message is shown that a certificate is not uploaded and to whether proceed further or not. Click Yes to proceed further without uploading a certificate or No to go back and upload the certificate.</p>
Username	Enter the credentials for the remote file server.
Password	Enter the credentials for the remote file server.

Table 239: Fields on the Custom Feeds Page, Feeds with Remote File Server (continued)

Field	Description
Update Interval	Select how often updates are retrieved from the remote files server: Hourly, Daily, Weekly, Monthly, Never

You can create only a single infected host. If you want to create one more infected host, you must first delete the existing feed and create a new one.

If you try to disenroll a site in an infected host, a warning message is shown to resolve all the current infected hosts from the respective endpoints within a site. To resolve the infected hosts, log-in to Sky ATP UI, resolve the hosts, and then unassign sites from Policy Enforcer. Ensure that you always resolve the infected hosts before unassigning sites. Once you unassign sites, you cannot resolve the hosts.

Configuring TTL Settings for Custom Feeds

To access this page, click **Configure>Threat Prevention>Custom Feeds**.

Use the Time to Live (TTL) Settings page to specify the number of days for the custom feed to be active.

In the Sky ATP with SDSN, Clouds feed only, and No Sky ATP modes, you can configure the TTL settings for dynamic address, whitelist, blacklist, infected host, and DDoS feed types. In the Sky ATP mode, you can configure TTL settings for only dynamic address, whitelist, and blacklist feed types.

NOTE: When you configure a TTL setting for a particular feed type, the configuration is applicable for all the custom feeds belonging to that particular feed type. For example, if you set TTL for Whitelist feed type to 45 days, then all Whitelist feeds will have the same configuration.

To configure TTL Settings:

1. Select **Configure>Threat Prevention>Custom Feeds**.

2. Select the **TTL Settings** tab.

The Time To live Settings page appears.

3. Complete the configuration by using the guidelines in [Table 242 on page 712](#).

4. Click **Update**.

The TTL settings are updated and a success message is shown that the TTL Settings are updated successfully. Click **Reset** to reset the settings to the last known stable configuration.

At the beginning of the TTL Settings page, the last updated TTL settings information is shown. This message is refreshed whenever you update a new TTL setting.

Table 242: Fields on the TTL Settings Page

Option	Description
Specify Manually	Select this option to specify the number of days for the required custom feed type to be active.
Never Expire	Select this option if you do not want any custom feed type to be inactive or expire.

Table 242: Fields on the TTL Settings Page *(continued)*

Option	Description
Expires in (days)	<p>This field is available only if you select the Specify Manually option.</p> <p>Specify the number of days for the required custom feed to be active. The available range is 1 to 365 days.</p> <p>The number of days that you configure in this field appears in the Days to Become Inactive field on each custom feed page. If you make any changes to this field, the same information is refreshed in the Days to Become Inactive field and the timer is adjusted to the updated value.</p>

Threat Prevention - Email Management

IN THIS CHAPTER

- Sky ATP Email Management Overview | 714
- Sky ATP Email Management: SMTP Settings | 716
- Email Management: Configure IMAP | 719
- Sky ATP Email Management: Whitelists and Blacklists | 722

Sky ATP Email Management Overview

With Email Management, enrolled devices transparently submit potentially malicious email attachments to the cloud for inspection. Once an attachment is evaluated, Sky ATP assigns the file a threat score between 0-10 with 10 being the most malicious.

NOTE: If an email contains no attachments, it is allowed to pass without any analysis.

Configure one of the following actions when an email attachment is determined to be malicious:

- Quarantine Malicious Messages—If you select to quarantine emails with attachments found to be malicious, those emails are stored in the cloud in an encrypted form and a replacement email is sent to the intended recipient. That replacement email informs the recipient of the quarantined message and provides a link to the Sky ATP quarantine portal where the email can be previewed. The recipient can then choose to release the email by clicking a Release button (or request that the administrator release it) or Delete the email.
- Deliver malicious messages with warning headers added—When you select this option, headers are added to emails that most mail servers recognize and filter into Spam or Junk folders.
- Permit—You can select to permit the email and the recipient receives it intact.

Figure 63: Email Management Overview

Quarantine Release

If the recipient selects to release a quarantined email, it is allowed to pass through the SRX series with a header message that prevents it from being quarantined again, but the attachments are placed in a password-protected ZIP file. The password required to open the ZIP file is also included as a separate attachment. The administrator is notified when the recipient takes an action on the email (either to release or delete it).

If you configure Sky ATP to have the recipient send a request to the administrator to release the email, the recipient previews the email in the Sky ATP quarantine portal and can select to Delete the email or Request to Release. The recipient receives a message when the administrator takes action (either to release or delete the email.)

Blacklist and Whitelist

Emails are checked against administrator-configured blacklists and whitelists using information such as Envelope From (MAIL FROM), Envelope To (RCPT TO), Body Sender, Body Receiver. If an email matches the whitelist, that email is allowed through without any scanning. If an email matches the blacklist, it is considered to be malicious and is handled the same way as an email with a malicious attachment.

RELATED DOCUMENTATION

[Sky ATP Email Management: SMTP Settings](#) | 716

Sky ATP Email Management: SMTP Settings

Use the this page to inspect and manage email attachments sent over SMTP.

- Read the “[Sky ATP Email Management Overview](#)” on [page 714](#) topic.
 - Decide how malicious emails are handled: quarantined, delivered with headers, or permitted.
1. Select **Configure > Threat Prevention > Sky ATP Email Management** and choose the **SMTP Settings** tab.
 2. Select a Sky ATP Realm and click the pencil icon to configure email management settings for that realm.
 3. Based on your selections, configuration options will vary. See the tables below.

Table 243: Configure Quarantine Malicious Messages

Setting	Guideline
Action to take	Quarantine malicious messages (the default)—When you select to quarantine malicious email messages, in place of the original email, intended recipients receive a custom email you configure with information on the quarantining. Both the original email and the attachment are stored in the cloud in an encrypted format.

Table 243: Configure Quarantine Malicious Messages (*continued*)

Setting	Guideline
Release option	<ul style="list-style-type: none"> Recipients can release email—This option provides recipients with a link to the Sky ATP quarantine portal where they can preview the email. From the portal, recipients can select to Release the email or Delete it. Either action causes a message to be sent to the administrator. <p>NOTE: If a quarantined email has multiple recipients, any individual recipient can release the email from the portal and all recipients will receive it. Similarly, if one recipient deletes the email from the portal, it is deleted for all recipients.</p> <ul style="list-style-type: none"> Recipients can request administrator to release email—This option also provides recipients with a link to the Sky ATP quarantine portal where they can preview the email. From the portal, recipients can select to Request to Release the email or Delete it. Either choice causes a message to be sent to the administrator. When the administrator takes action on the email, a message is sent to the recipient. <p>NOTE: When a quarantined email is released, it is allowed to pass through the SRX series with a header message that prevents it from being quarantined again, but the attachment is placed inside a password-protected zip file with a text file containing the password that the recipient must use to open the file.</p>
<i>Email Notifications for End Users</i>	
Learn More Link URL	If you have a corporate web site with further information for users, enter that URL here. If you leave this field blank, this option will not appear to the end user.
Subject	When an email is quarantined, the recipient receives a custom message informing them of their quarantined email. For this custom message, enter a subject indicating a suspicious email sent to them has been quarantined, such as "Malware Detected."
Custom Message	Enter information to help email recipients understand what they should do next.
Custom Link Text	Enter custom text for the Sky ATP quarantine portal link where recipients can preview quarantined emails and take action on them.

Table 243: Configure Quarantine Malicious Messages (*continued*)

Setting	Guideline
Buttons	<ul style="list-style-type: none"> • Click Preview to view the custom message that will be sent to a recipient when an email is quarantined. Then click Save. • Click Reset to clear all fields without saving. • Click Save if you are satisfied with the configuration.

Table 244: Configure Deliver with Warning Headers

Setting	Guideline
Action to take	Deliver malicious messages with warning headers added—When you select to deliver a suspicious email with warning headers, you can add headers to emails that most mail servers will recognize and filter into spam or junk folders.
SMTP Headers	<ul style="list-style-type: none"> • X-Distribution (Bulk, Spam)—Use this header for messages that are sent to a large distribution list and are most likely spam. You can also select “Do not add this header.” • X-Spam-Flag—This is a common header added to incoming emails that are possibly spam and should be redirected into spam or junk folders. You can also select “Do not add this header.” • Subject Prefix—You can prepend headers with information for the recipient, such as “Possible Spam.”
Buttons	<ul style="list-style-type: none"> • Click Reset to clear all fields without saving. • Click OK if you are satisfied with the configuration.

Table 245: Permit

Setting	Guideline
Action to take	Permit—You can select to permit the message and no further configuration is required.

Administrators Who Receive Notifications

To send notifications to administrators when emails are quarantined or released from quarantine:

1. Click the + sign to add an administrator.
2. Enter the administrator's email address.
3. Select the **Quarantine Notification** check box to receive those notifications.

4. Select the **Release Notifications** check box to receive those notifications.
5. Click **OK**.

Email Management: Configure IMAP

To access this page, navigate to **Configure > Threat Prevention > Sky ATP Email Management**.

Use the Sky ATP Email Management page to configure email management for IMAP. With email management for IMAP, enrolled SRX Series devices transparently submit suspicious emails to Sky ATP for inspection and blocking.

Before You Begin

- Read the [“Sky ATP Email Management Overview” on page 714](#) topic.
- Decide how malicious emails are handled. For IMAP, the available options are to block or permit email. Unlike SMTP, there is no quarantine option for IMAP and no method for previewing a blocked email.

To configure IMAP:

1. Select **Configure > Threat Prevention > Sky ATP Email Management** and choose the **IMAP Settings** tab.
2. Select a Sky ATP Realm and click the pencil icon to configure email management settings for that realm.
3. Complete the configuration as per the guidelines given in [Table 246 on page 720](#).

Based on your selections, configuration options will vary.

Table 246: Configure Block Malicious Messages

Setting	Guideline
Action to take	<ul style="list-style-type: none"> • Permit download of attachments—Allow email attachments, either from all IMAP servers or specific IMAP servers, through to their destination. NOTE: In Permit mode, black and white lists are not checked. Emails from blacklisted addresses are not sent to the cloud for scanning. They are allowed through to the client. • Block download of attachments—Block email attachments, either from all IMAP servers or specific IMAP servers, from reaching their destination. NOTE: In Block mode, black and white lists are checked. Emails from blacklisted addresses are blocked. Emails from whitelisted addresses are allowed through to the client. <p>Recipients can send a request to an administrator to release the email. Enter the email address to which recipients should send a release request.</p> <p>NOTE: If a blocked email has multiple recipients, any individual recipient can request to release the email and all recipients will receive it.</p> <p>When you select to block email attachments, in place of the original email, intended recipients receive a custom email you configure with information on the block action. Both the original email and the attachment are stored in the cloud in an encrypted format.</p>
IMAP Server	<ul style="list-style-type: none"> • All IMAP Servers—The permitting or blocking of email attachments applies to all IMAP servers. • Specific IMAP Server—The permitting or blocking of email attachments applies only to IMAP servers with hostnames that you add to a list. A configuration section to add the IMAP server name appears when you select this option. <p>When you add IMAP servers to the list, it is sent to the SRX Series device to filter emails sent to Sky ATP for scanning. For emails that are sent for scanning, if the returned score is above the set policy threshold on the SRX, then the email is blocked.</p>
IMAP Servers	<p>Select the Specific IMAP Server option above and click the + sign to add IMAP server hostnames to the list.</p> <p>NOTE: You must use the IMAP server hostname and not the IP address.</p>
<i>Email Notifications for End Users</i>	

Table 246: Configure Block Malicious Messages (*continued*)

Setting	Guideline
Learn More Link URL	If you have a corporate web site with further information for users, enter that URL here. If you leave this field blank, this option will not appear to the end user.
Subject	When an email is blocked, the recipient receives a custom message informing them of their blocked email. For this custom message, enter a subject indicating a suspicious email sent to them has been blocked, such as "Malware Detected."
Custom Message	Enter information to help email recipients understand what they should do next.
Custom Link Text	Enter custom text for the Sky ATP quarantine portal link where recipients can preview blocked emails and take action on them.
Buttons	<ul style="list-style-type: none"> • Click Preview to view the custom message that will be sent to a recipient when an email is blocked. Then click Save. • Click Reset to clear all fields without saving. • Click Save if you are satisfied with the configuration.

Administrators Who Receive Notifications

To send notifications to administrators when emails are blocked or released from quarantine:

1. Click the + sign to add an administrator.
2. Enter the email address of the administrator and click **OK**.
3. Once the administrator is created, you can uncheck or check which notification types the administrator will receive.
 - Block Notifications—If you enable this option, a notification is sent when an email is blocked.
 - Unblock Notifications—If you enable this option, a notification is sent when a user releases a blocked email.

RELATED DOCUMENTATION

Sky ATP Email Management: Whitelists and Blacklists

Access this page from **Configure > Threat Prevention > Sky ATP Email Management** and choose either the **Whitelist** or **Blacklist** tab.

Use custom blacklists and whitelists to filter email attachments.

- Read the [“Sky ATP Email Management Overview” on page 714](#) topic.
- Compile a list of known malicious email addresses or domains to add to your blacklist. If an email matches the blacklist, it is considered to be malicious and is handled the same way as an email with a malicious attachment, blocked and a replacement email is sent. If an email matches the whitelist, that email is allowed through without any scanning.
- It is worth noting that attackers can easily fake the “From” email address of an email, making blacklists a less effective way to stop malicious emails.

The procedure for adding addresses to blacklists and whitelists is the same, although the results are very different. Be sure you are adding the entry to the correct list.

1. Select **Configure > Threat Prevention > Sky ATP Email Management** and choose either the **Whitelist** or **Blacklist** tab..
2. Select a Sky ATP realm and click the + sign to add a new entry.
3. In the Email Sender field, enter the full address in the format **name@domain.com** or wildcard the name to permit or block all emails from a specific domain. For example, ***@domain.com**.
4. Click **OK**.

Sky ATP Malware Management Overview

Malware management includes profiles you can create to group file types together for scanning. It also lets you configure customized whitelists and blacklists.

- File inspection profiles let you define which files to send to the cloud for inspection. By grouping similar file types together to be scanned (such as .tar, .exe, and .java) under a common name, you can create multiple profiles based on the content you want scanned. Then enter the profile names on eligible SRX Series devices to apply them.
- Use the whitelist and blacklist pages to configure custom trusted and untrusted URLs and IPs. Content downloaded from locations on the whitelist is trusted and does not have to be inspected for malware. Hosts cannot download content from locations on the blacklist because those locations are untrusted.

File Inspection Profiles Overview

File Inspection profiles let you define which files to send to the cloud for inspection. You can group types of files to be scanned together (such as .tar, .exe, and .java) under a common name and create multiple profiles based on the content you want scanned. Then enter the profile names on eligible devices to apply them.

Table 247: File Category Contents

Category	Description
Archive	Archive files
Configuration	Configuration files
Document	All document types except PDFs
Executable	Executable binaries
Java	Java applications, archives, and libraries
Library	Dynamic and static libraries and kernel modules
Mobile	Mobile formats
OS package	OS-specific update applications
PDF	PDF, e-mail, and MBOX files
Rich Application	Installable Internet Applications such as Adobe Flash, JavaFX, Microsoft Silverlight
Script	Scripting files

You can also define the maximum file size requirement per each category to send to the cloud. If a file falls outside of the maximum file size limit the file is automatically downloaded to the client system.

NOTE: Once the profile is created, use the `set services advanced-anti-malware policy CLI` command to associate it with the Sky ATP profile.

NOTE: If you are using the free model of Sky ATP, you are limited to only the executable file category.

[File Scanning Limits | 107](#)

Creating File Inspection Profiles

Access this page from **Configure > Threat Prevention > Sky ATP Malware Management** and choose the **File Inspection Profiles** tab.

- Read the “[File Inspection Profiles Overview](#)” on [page 724](#) topic.
- Read the “[File Scanning Limits](#)” on [page 107](#) topic.
- Note that if you are using the free version of Sky ATP, only executable files are scanned.

To configure file inspection profiles:

1. From the **File Inspection Profiles** tab, click the + sign.
2. Enter a name for the profile. (You can create multiple profiles for file inspection.)
3. Select a **Sky ATP Realm**.
4. Select the file types to include using the check boxes. You can also define the maximum file size requirement per each category to send to the cloud. If a file falls outside of the maximum file size limit, the file is automatically downloaded to the client system. See [Table 248 on page 726](#) for the list of file types for each category.
5. Click **OK**.

Table 248: File Category Contents

Category	Description
Active media	Flash and Silverlight applications
Archive	Archive files
Code	Source code
Config	Configuration files
Document	All document types except PDFs
Emerging threat	A special category that includes known threat source file types
Executable	Executable binaries
Java	Java applications, archives, and libraries
Library	Dynamic and static libraries and kernel modules
Media	Audio video formats
OS package	OS-specific update applications
Script	Scripting files
Portable document	PDF, e-mail, and MBOX files

NOTE: Once the profile is created, use the `set services advanced-anti-malware policy CLI` command to associate it with the Sky ATP profile.

Creating Whitelists and Blacklists

Access this page from **Configure > Threat Prevention > Sky ATP Malware Management** and choose the **Whitelist** or **Blacklist** tab.

- Decide on the type of location you intend to define: URL or IP.
- Review current list entries to ensure the item you are adding does not already exist.
- Review syntax requirements for entries in [Table 249 on page 727](#).

To configure whitelists and blacklists:

1. From the **Whitelist** or **Blacklist** tab, click the + sign.
2. Select a **Sky ATP Realm**.
3. Click the + sign.
4. Enter an IP address or a URL. Continue to click the + sign to add more entries. See [Table 249 on page 727](#) for syntax requirements.
5. Click **OK**.

Table 249: Whitelist and Black Syntax

Setting	Guideline
IP	Enter an IPV4 address in standard four octet format. CIDR notation and IP address ranges are also accepted. Any of the following formats are valid: 1.2.3.4, 1.2.3.4/30, or 1.2.3.4-1.2.3.6.
URL	Enter the URL using the following format: juniper.net. Wildcards and protocols are not valid entries. The system automatically adds a wildcard to the beginning and end of URLs. Therefore juniper.net also matches a.juniper.net, a.b.juniper.net, and a.juniper.net/abc. If you explicitly enter a.juniper.net, it matches b.a.juniper.net, but not c.juniper.net. You can enter a specific path. If you enter juniper.net/abc, it matches x.juniper.net/abc, but not x.juniper.net/123.

To edit an existing whitelist or blacklist entry, select the check box next to the entry you want to edit and click the pencil icon.

Sky ATP periodically polls for new and updated content and automatically downloads it to your SRX Series device. There is no need to manually push your whitelist or blacklist files.

IPsec VPN Overview

A VPN provides a means for securely communicating among remote computers across a public WAN such as the Internet.

Security Director simplifies the management and deployment of IPsec VPNs. In general, VPN configurations are tedious and repetitive when deploying over a large number of SRX Series devices and for full-meshed VPN deployments. With Security Director, you can use VPN profiles to group common settings and apply them to multiple VPN tunnel configurations across multiple SRX Series devices. You can mass deploy site-to-site, hub-and-spoke, and fully meshed VPNs. Security Director determines the necessary deployment scenarios and publishes the required configuration necessary for all SRX Series devices.

You can configure the following parameters for an IPsec VPN:

- Endpoints for a site-to-site VPN and full-mesh VPN
- Hubs and spokes for a hub-and-spoke VPN

- External Interface, tunnel zone, and protected networks or zones for each device
- Routing settings
- VPN endpoint configuration

NOTE:

- Security Director views each logical system as any other security device and takes ownership of the security configuration of the logical system. In Security Director, each logical system is managed as a unique security device.
- Security Director ensures that the tunnel interfaces are exclusively assigned to the individual logical systems of a device. No tunnel interface is assigned to more than one logical system of the same device.

RELATED DOCUMENTATION[Understanding IKE Authentication | 739](#)[Understanding IPsec VPN Routing | 738](#)[Understanding IPsec VPN Modes | 736](#)[Comparison of Policy-Based VPNs and Route-Based VPNs | 736](#)[Creating IPsec VPNs | 730](#)

Creating IPsec VPNs

IPsec VPN provides a means for securely communicating among remote computers across a public WAN such as the Internet. A VPN connection can link two LANs (site-to-site VPN) or a remote dial-up user and a LAN. The traffic that flows between these two points passes through shared resources such as routers, switches, and other network equipment that make up the public WAN. To secure VPN communication that passes through the WAN, create an IPsec tunnel.

Security Director supports policy-based and route-based IPsec VPNs on SRX Series devices. Policy-based VPNs are supported only in the site-to-site deployments, where you configure two endpoints. If you have two or more SRX Series devices, then route-based VPNs offer more flexibility and scalability. You can select between site-to-site, full-mesh, and hub-and-spoke for route-based VPNs. To allow data to be securely transferred between a branch office and the corporate office, configure a policy-based or route-based IPsec VPN. For an enterprise-class deployment, configure a hub-and-spoke IPsec VPN.

After the VPN configuration is saved, you can provision this VPN on your security devices. VPN changes are published much like changes to firewall policies and IPS policies. You can publish and deploy a VPN configuration independently without waiting for a firewall, IPS, or NAT policy to get published first.

Before You Begin

- Read the [“IPsec VPN Overview” on page 729](#) topic.
- Review the IPsec VPN main page for an understanding of your current data set. See [“IPsec VPN Main Page Fields” on page 748](#) for field descriptions.
- Create addresses and address sets.
- Create VPN profiles.
- Define extranet devices.

Configuring IPsec VPNs Settings

To configure an IPsec VPN:

1. Select **Configure > IPsec VPN. > IPsec VPNs**
2. Click the plus sign (+) to create a new IPsec VPN.
3. Complete the configuration according to the guidelines provided in the [Table 250 on page 731](#) through [Table 253 on page 735](#).

A new IPsec VPN is created.

Table 250: IPsec VPN Configuration Parameters

Settings	Guidelines
Create VPN Wizard	Use step-by-step procedures to create a new VPN. You can create site-to-site, hub-and-spoke, and full-mesh VPNs in Create VPN Wizard.
<i>General Information</i>	
Name	Enter the name for the new VPN. This is a mandatory field.
Description	Enter a description for the new VPN.

Table 250: IPsec VPN Configuration Parameters (*continued*)

Settings	Guidelines
Tunnel Mode	<p>Select either route based or policy based for tunnel mode.</p> <p>NOTE: SRX Series devices support only tunnel mode.</p> <p>Use route-based tunnel mode if:</p> <ul style="list-style-type: none"> • Participating gateways are Juniper Networks products. We recommend the route-based option. • Either source or destination NAT must occur when traffic traverses the VPN. • Dynamic routing protocols must be used for VPN routing. • Primary and backup VPNs are required in the setup. <p>Use policy-based tunnel mode if:</p> <ul style="list-style-type: none"> • The remote VPN gateway is a non-Juniper Networks device. • Access to the VPN must be restricted for specific application traffic.
Multi-Proxy ID	<p>Select this check box to enable Multi-Proxy ID (also known as Traffic Selector). Enable this option if unique traffic selectors must be configured for every local or remote pair of networks.</p>
Type	<p>Select a topology deployment for an IPsec VPN.</p> <ul style="list-style-type: none"> • Site to Site—Select if a tunnel must be set up between two sites. <p>NOTE: Site to Site VPN does not support Qualified Next Hop configuration in Security Director.</p> <ul style="list-style-type: none"> • Full-Mesh—Select if there are two or more participating gateways and a separate tunnel must be set up with every other device in the group. • Hub and Spoke—Select if VPN must be set up from multiple remote sites through a centralized (main office or head office) hub gateway.
VPN Profile	<p>Select a VPN profile from the drop-down list based on the deployment scenario.</p> <p>NOTE: If you choose to create a full-mesh VPN, you can choose only MainModeProfile as the VPN profile</p>
Preshared Key	<p>Establish a VPN connection using preshared keys, which is essentially a password that is the same for both parties. Preshared keys are commonly deployed for site-to-site IPsec VPNs, either within a single organization or between different organizations.</p> <p>Select the type of preshared key you want to use.</p> <ul style="list-style-type: none"> • Auto-generate—When selected, the Generate Unique key per tunnel check box is automatically selected. If you clear the Generate Unique key per tunnel check box, Security Director generates a single key for all tunnels. • Manual—Enter the manual key in the Manual Key field. By default, the manual key is masked. To unmask the manual key, select the unmask check box.

Table 251: Endpoint Configuration Parameters

Settings	Guidelines
Endpoint	Select either Devices or Extranet devices as endpoints.
Available	<p>View all devices from the current and child domains, with view parent enabled. Devices from the child domain with view parent disabled are not shown.</p> <p>You can select a device and add it as an endpoint.</p> <p>The following filter criteria are applied for the device selection:</p> <ul style="list-style-type: none"> • SRX Series devices mapped to Junos OS Release 12.1X46 and later Junos-es schemas are not shown. • Logical systems are not shown. • Routing option is not applicable.
Selected	View devices added as endpoints listed in this column.

Table 252: VPN Tunnel and Route Setting Parameters

Settings	Guidelines
<i>Tunnel Settings</i>	
Interface Type	<p>Select the interface type in which to direct traffic•</p> <ul style="list-style-type: none"> • Unnumbered—These tunnel interfaces do not have any IP addresses assigned to them. • Numbered—These tunnel interfaces have IP addresses assigned to them. <ul style="list-style-type: none"> • Network IP—Enter the IP address of the numbered interface. This is the subnet address from where the IP address is automatically assigned for tunnel interfaces. • Subnet Mask—Enter the subnet mask.
Number of Spoke devices per tunnel interface	<p>Select either:</p> <ul style="list-style-type: none"> • All—Assign all spoke devices to a single tunnel interface. • Specify Value—Specify the number of spoke devices to assign per tunnel interface.
Max Transmission Unit	Select the maximum transmission unit (MTU) in bytes. You can specify the MTU value for the tunnel endpoint. The default value is 9192 for SRX Series tunnel devices.
<i>Route Settings</i>	

Table 252: VPN Tunnel and Route Setting Parameters (*continued*)

Settings	Guidelines
Routing Options	<p>Select one of the following options:</p> <ul style="list-style-type: none"> • Static—Generates static routing based on the protected networks or zones per device. <ul style="list-style-type: none"> • Spoke to Spoke communication—Select the Allow box to enable spoke-to-spoke communication with static routes. You can enable this option only for a hub-and-spoke VPN with static routing when you create or modify the VPN. By default, this option is not selected and you can select or clear this option during the modify workflow. • OSPF—Generates OSPF configuration. <ul style="list-style-type: none"> • Export—Select the Static routes box to export static routes. Security Director simplifies VPN address management by enabling the administrator to export static routes to a remote site over a tunnel, allowing the static route networks to participate in the VPN. However, only devices on the hub side can export static default routes to the device side. Devices at the spoke side cannot export static default routes over a tunnel. Select the RIP routes box to export RIP routes. You can export RIP routes only for OSPF routing. • Area ID—Specify an area ID within the range of 0 to 4,294,967,295, which is where the tunnel interfaces of this VPN need to be configured. • RIP—Generates RIP configuration. <ul style="list-style-type: none"> • Export—Select the Static routes box to export static routes. Select the OSPF routes box to export OSPF routes. If you select OSPF or RIP export, the OSPF or RIP network outside the VPN network are imported into a VPN network through OSPF or RIP routing protocols. • Max Retransmission Time—Configure the retransmission timer to limit the number of times the RIP demand circuit resends update messages to an unresponsive peer. If the configured retransmission threshold is reached, routes from the next-hop router are marked as unreachable and the hold-down timer starts. You must configure a pair of RIP demand circuits for this timer to take effect. The retransmission range is from 5 through 180 seconds and the default value is 50 seconds. • None—No routing configuration is generated.
Spoke-to-Spoke Communication	Select this option to enable spoke-to-spoke communication.
<i>Global Settings</i>	
External Interface	Specify the outgoing interface for IKE SAs. This interface is associated with a zone that acts as its carrier, providing firewall security for it.

Table 252: VPN Tunnel and Route Setting Parameters (*continued*)

Settings	Guidelines
Tunnel Zone	<p>Configure the tunnel zone. They are logical areas of address space that can support dynamic IP (DIP) address pools for NAT applications to pre- and post-encapsulated IPSec traffic.</p> <p>Tunnel zones also provide great flexibility in combining tunnel interfaces with VPN tunnels.</p>
Protected Network Zone/Networks/Interfaces	Configure the security zone type to protect one area of the network from the other.

Table 253: Endpoint Settings Parameters

Settings	Guidelines
External Interface	Select the external interface for the selected device.
Tunnel Zone	<p>Configure the tunnel zone for the selected device. They are logical areas of address space that can support dynamic IP (DIP) address pools for NAT applications to pre- and post-encapsulated IPSec traffic.</p> <p>Tunnel zones also provide great flexibility in combining tunnel interfaces with VPN tunnels.</p>
Protected Network Zone/Networks/Interfaces	Configure the security zone type for the selected device to protect one area of the network from the other.
Routing Instance	Select the type of routing instance.
IKE Local Address	Specify the local IKE identity to send in the exchange with the destination peer so that the destination peer can communicate with the local peer.

Understanding IPsec VPN Modes

The following two modes determine how traffic is exchanged in the VPN:

- **Tunnel Mode**—This mode encapsulates the original IP packet within another packet in the VPN tunnel. This is most commonly used when hosts within separate private networks want to communicate over a public network. Both VPN gateways establish the VPN tunnel to each other, and all traffic between the two gateways appears to be from the two gateways, with the original packet embedded within the exterior IPsec packet.
- **Transport Mode**—This mode does not encapsulate the original packet in a new packet, as tunnel mode does; rather, transport mode sends the packet directly between the two hosts that have established the IPsec tunnel.

Tunnel mode is the most common VPN mode on the Internet because it easily allows entire networks (particularly those with private address space) to communicate over public IP networks. Transport mode is primarily used when encrypting traffic between two hosts to secure communication where IP address overlap is not an issue (for example, between a host and a server on a private network).

Comparison of Policy-Based VPNs and Route-Based VPNs

Security Director supports configuring two types of VPNs for SRX Series devices – policy-based and route-based VPNs. The underlying IPsec functionality is essentially the same in terms of traffic being encrypted.

Table 1 summarizes the differences between policy-based VPNs and route-based VPNs.

Table 254: Differences between Policy-Based and Route-Based VPNs

Policy-Based VPNs	Route-Based VPNs
A tunnel is treated as an object that, together with source, destination, application, and action, constitutes a tunnel policy permitting VPN traffic.	A policy does not specifically reference a VPN tunnel.
A tunnel policy specifically references a VPN tunnel by name.	A route determines which traffic is sent through the tunnel based on a destination IP address.
The number of policy-based VPN tunnels that you can create is limited by the number of tunnels that the device supports.	The number of route-based VPN tunnels that you can create is limited by the number of st0 interfaces (for point-to-point VPNs) or the number of tunnels that the device supports, whichever is lower.
Although you can create numerous tunnel policies referencing the same VPN tunnel, each tunnel policy pair creates an individual IPsec security association (SA) with the remote peer. Each SA counts as an individual VPN tunnel.	Because the route, not the policy, determines which traffic goes through the tunnel, multiple policies can be supported with a single SA or VPN.
The action must be permit and must include a tunnel.	The regulation of traffic is not coupled to the means of its delivery.
The exchange of dynamic routing information is not supported.	Route-based VPNs support the exchange of dynamic routing information through VPN tunnels. You can enable an instance of a dynamic routing protocol, such as OSPF, on a st0 interface that is bound to a VPN tunnel.
If you need more granularity than a route can provide to specify the traffic sent to a tunnel, using a policy-based VPN with security policies is the best choice.	Route-based VPNs use routes to specify the traffic sent to a tunnel; a policy does not specifically reference a VPN tunnel.
You can consider a tunnel as an element in the construction of a policy.	When the security device does a route lookup to find the interface through which it must send traffic to reach an address, it finds a route through a secure tunnel (st0) interface. With a route-based VPN tunnel, you can consider a tunnel as a means for delivering traffic, and you can consider the policy as a method for either permitting or denying the delivery of that traffic.

Proxy ID is supported for both route-based and policy-based VPNs. However, the multi-proxy ID is supported for only route-based VPNs. The multi-proxy ID is also known as traffic selector. A traffic selector

is an agreement between IKE peers to permit traffic through a tunnel, if the traffic matches a specified pair of local and remote addresses. You define a traffic selector within a specific route-based VPN, which can result in multiple Phase 2 IPsec SAs. Only traffic that conforms to a traffic selector is permitted through an SA. The traffic selector is commonly required when remote gateway devices are non-Juniper Networks devices.

[Creating IPsec VPNs | 730](#)

Understanding IPsec VPN Routing

SRX Series devices must know how to reach destination networks. This can be done through the use of static routing or dynamic routing. In Security Director, route-based VPNs support OSPF and RIP routing along with static routing. Static routing requires that administrators specify the list of host or network addresses at each site as part of the VPN. For example, in a retail scenario, where thousands of spokes can be part of a VPN, the static routing approach generates a huge configuration at each device. Static routing requires administrator to manually configure each route. Problems occur as the infrastructure changes or when the administrator does not have access to the addresses for the protected network. Keeping routes up-to-date manually creates tremendous overhead.

[Creating IPsec VPNs | 730](#)

Understanding IKE Authentication

The IKE negotiations only provide the ability to establish a secure channel over which two parties can communicate. You still need to define how they authenticate each other. This is where IKE authentication is used to ensure that the other party is authorized to establish the VPN.

The following IKE authentications are available:

- **Preshared key authentication**—The most common way to establish a VPN connection is to use preshared keys, which is essentially a password that is the same for both parties. This password must be exchanged in advance in an out-of-band mechanism, such as over the phone, through a verbal exchange, or through less secure mechanisms, even e-mail. The parties then authenticate each other by encrypting the preshared key with the peer's public key, which is obtained in the Diffie-Hellman exchange.

Preshared keys are commonly deployed for site-to-site IPsec VPNs, either within a single organization or between different organizations. To ensure that preshared keys are used in the most secure fashion, a preshared key must consist of at least 8 characters (12 or more is recommended) using a combination of letters, numbers, and nonalphanumeric characters, along with different cases for the letters (the preshared key should not use a dictionary word).

- **Certificate authentication**—Certificate-based authentication is considered more secure than preshared key authentication because the certificate key cannot be compromised easily. Certificates are also far more ideal in larger scale environments with numerous peer sites that should not all share a preshared key. Certificates are composed of a public and private key, and can be signed by a master certificate known as a certificate authority (CA). In this way, certificates can be checked to see if they are signed with a CA that is trusted.

Publishing IPsec VPNs

To publish an IPsec VPN:

1. Select **Configure > IPsec VPN > IPsec VPNs**.
2. Select the VPN that you want to publish and click **Publish**. The Publish Policy page appears.
3. Select the check boxes next to the devices to which the policy changes will be published.

NOTE: You can search for a specific device on which the VPN is published by entering the search criteria in the search field in the top-right corner of the Services page. You can search the devices by their name, IP address, or the device OS version.

NOTE: If the VPN is to be published on a large number of devices, the devices are displayed across multiple pages. You can use the pagination and display options available on the lower ribbon, just below the list of devices, to view all devices on which the VPN is published.

4. Select **Schedule at a later time** if you want to schedule and publish the configuration later.
5. Select **Run now** if you want to apply the configuration immediately.
6. Click **Publish**. The Affected Devices page displays the devices on which the VPN will be published.

Modifying VPN Settings

IN THIS SECTION

- [Modifying General Settings | 742](#)
- [Modifying Device Association | 743](#)
- [Modifying Tunnel Settings | 743](#)
- [Modifying Device Endpoint Settings | 743](#)

Using the Modify VPN wizard, you can modify the following VPN settings:

- General settings
- Device association
- Tunnel route settings
- Device endpoint settings
- Tunnel settings

To modify the VPN settings:

1. Select **Configure > IPsec VPN > VPNs**. The VPN page appears.
2. Right-click the VPN that you want to modify, or select **Modify VPN** from the More list. The Modify VPN page appears.
3. Edit the required sections and click **Finish**.

Modifying General Settings

To modify the general settings of a VPN:

1. Under the General Settings step, you can modify the following fields:
 - Name
 - Description
 - Tunnel mode
 - Multi-Proxy ID
 - Type
 - VPN Profile
 - Preshared Key
 - Generate a Unique key per tunnel check box.
 - Manual key, if the preshared key is selected as Manual.
2. Click **Next** to modify device endpoints.

Modifying Device Association

You can modify the associated devices of your VPN using this option.

1. Select Devices option to modify its endpoint settings. You can add more endpoints listed in the Available column or remove the already configured endpoints listed in the Selected column.
2. Select Extranet option to modify endpoint settings of extranet devices. You can add more devices listed in the Available column or remove the already configured devices listed in the Selected column.
3. Click **Next** to modify tunnel settings.

Modifying Tunnel Settings

You can modify the following tunnel or route settings of your VPN using this option.

- Interface type
- Maximum transmission unit
- Network IP, if the interface type is Numbered.
- Routing options
- Area ID for the OSPF routing option.
- Maximum retransmission time for the RIP routing option.

Click **Next** to modify device endpoint settings.

Modifying Device Endpoint Settings

You can modify the following endpoint settings for each device under this option. Click on each column to edit the value.

- External interface
- Tunnel zone
- Routing instance
- IKE address
- Proxy ID
- Protected Zone/Network

To view or edit tunnel configuration for each device:

1. Select the device and click **View / Edit Tunnel** option. The Tunnels page appears.

2. Click on each column to edit the respective values.
3. Click **OK**.

RELATED DOCUMENTATION

[Creating IPsec VPNs | 730](#)

[IPsec VPN Overview | 729](#)

Viewing Tunnels

You can view all the tunnels configured for your VPN using this option.

To view the tunnel information of a VPN:

1. Select **Configure > IPsec VPN > VPNs**.

The VPN page appears.

2. Right-click the VPN that you want to view the tunnel configuration, or select **View Tunnels** from the More list.

The Tunnels page appears showing the summary of tunnel configurations for device associated with the selected VPN.

3. Click **OK**.

Importing IPsec VPNs

Junos Space Security Director lets you import of your existing large and complex VPN configurations into Security Director. You do not have to recreate the same VPN environment to allow Security Director to manage it. During the VPN import, all VPN-related objects are also imported along with the VPN.

Security Director supports importing the following VPN configuration:

- Site-to-site, hub-and-spoke, and full-mesh topologies
- Preshared key-based VPNs
- Certificate-based VPNs, except AutoVPN
- Route-based and policy-based VPNs
- OSPF
- RIP
- Single proxy ID
- Traffic selectors
- Static route configurations that identify the protected network objects
- Static route configurations with spoke-to-spoke communication enabled
- Numbered and unnumbered tunnel interface types
- Route-metric configuration
- Static route configuration from a virtual router

To import a VPN:

1. Select **IPSec VPN > IPSec VPNs**.

The existing VPNs are listed on the right pane.

2. select Import VPN from the More option.

The Import VPN page appears.

3. Click **Next**.

The Select Devices page appears. You can select one or more devices from which the VPN configuration must be imported. The filter option enables you to perform the free text search on the device name, IP address, and device platform.

4. Select the security device to import its VPN settings. Click **Next**.

A progress bar appears showing the analysis of the device configurations.

5. After analyzing the VPN configuration, Security Director performs the configuration parsing and the endpoint correlation. During the endpoint correlation if any conflicting configurations are found, you can either proceed to ignore the conflicts during the import and log this detail as a job or cancel the operation. Click Yes to ignore the conflicts and import the remaining configuration or No to abort the import and proceed to the next step to select devices.

The conflict occurs when the combination of IKE and IPsec parameters are same between the endpoints. The following points explain the scenarios under which the conflicts occur for different VPN configuration types:

- Preshared key and Main Mode
 - Preshared key
 - Local IKE ID of local endpoint and remote IKE ID of remote endpoint
 - Remote IKE ID of local endpoint and local IKE ID of remote endpoint
- Preshared key and Aggressive Mode
 - Preshared key
 - Local IKE ID of local endpoint and remote IKE ID of remote endpoint

OR

 - Remote IKE ID of local endpoint and local IKE ID of remote endpoint
- Certificate, Main Mode, and DN type IKE ID
 - Remote IKE ID of local endpoint and DN of the certificate of remote endpoint
 - DN of the certificate of the local endpoint and remote IKE ID of remote endpoint
- Certificate, Main Mode and other IKE ID type
 - Local IKE ID of the local endpoint and remote IKE ID of the remote endpoint
 - Remote IKE ID of local endpoint and local IKE ID of remote endpoint
- Certificate, Aggressive Mode, and DN type IKE ID
 - Remote IKE ID of local endpoint and DN of the certificate of remote endpoint
 - DN of the certificate of the local endpoint and remote IKE ID of remote endpoint
- Certificate, Aggressive Mode, and other IKE ID type
 - Local IKE ID of local endpoint and remote IKE ID of remote endpoint

OR

 - Remote IKE ID of local endpoint and local IKE ID of remote endpoint

If there are no conflicts, you can directly proceed to Step 6.

6. The Select EndPoints page appears showing the VPN settings.

All the imported VPNs will have autogenerated names, which you have the option to modify. Click the VPN name and enter the name. There is a predefined quick filter available to list all the errors and warnings. Click the drop-down list to select the required filter parameter.

The Select EndPoints page lists the VPNs discovered from the configuration and allows you to explore the devices, or endpoints for each of the discovered VPNs. You can also perform a free text search on the VPN name, device name, and endpoint names.

Table 1 shows the description of each column.

Table 255: Settings Guidelines

Settings	Guidelines
Column Name	Description
VPNs & Local Endpoints	Lists all the discovered VPNs and their associated devices and endpoints in a tree structure.
Remote Endpoints	Shows matching endpoint details.
Warning	Displays any information, error, and warning messages detected during the import.

- The Summary page appears. All the VPNs listed on this page are saved in the Security Director database for further management.

Click **Finish**. A progress bar appears showing the progress of the import. Once the import is successful, you can manage the VPNs from the VPN landing page.

- The final summary page appears showing the number of VPNs, devices, and endpoints imported. To view the complete job details, click full log details. The Job Details page appears.
- Click **Close**. All the imported VPN configurations appear on the VPN landing page.

NOTE: At any point of the import workflow, you can choose to exit. All your settings and progress are discarded.

Note:

- The schema version of the device must be mapped to the Junos version to import all the VPN settings.
- You must republish the imported VPNs before modifying them further.
- VPN imported without IKE IDs configured on devices is not available for any modifications, unless you modify any VPN settings. On modifying these imported VPNs generate local or remote IKE IDs.

- Single-ProxyID, Multi-ProxyID, and the preshared key settings are imported at the tunnel level.
- By default, for the imported VPNs, the preshared key type is shown as Auto-generate. However, a new key is not generated for the already imported tunnels. If a new device is added to the VPN, only for that device, a new key is autogenerated.

IPsec VPN Main Page Fields

Use IPsec VPN to secure your network traffic with encryption and authentication. The VPN tunnels are central components of networks and secure the data between different sites and remote users. Table 1 describes the fields on this page.

Table 256: IPsec VPN Main Page Fields

Field	Description
Name	Name of the IPsec VPN.
Description	Description of the IPsec VPN.
Type	There are different types of topology deployments for IPsec VPN: site-to-site, full-mesh, hub-and-spoke.
Profile Name	Name of the VPN profile. The security parameters are defined in this profile to establish VPN connection between two sites.
Publish State	<p>Display the publish state of the VPN configuration. You can verify your VPN configurations before updating them to the device.</p> <p>Published - Configuration is published to all devices involved in the VPN.</p> <p>Partially Published - Configuration is published to only fewer devices involved in the VPN.</p> <p>Unpublished - VPN is created but not published.</p> <p>Republish Required - Modifications are made to the VPN configuration after it is published.</p>
Domain Name	Display the user domain for mapping objects and managing sections of a network.

IPsec VPN-Extranet Devices

IN THIS CHAPTER

- [Creating Extranet Devices | 750](#)
- [Extranet Devices Main Page Fields | 751](#)

Creating Extranet Devices

Use the Extranet devices page to manage the third-party devices that Junos Space does not directly control or manage. Extranet devices can be ScreenOS devices or other vendor VPN-capable firewall devices that cannot be managed by Security Director. Extranet devices in the Security Director help users design and manage VPNs residing between SRX Series devices and third-party devices without actually being connected to them.

Before you begin

- Review the Extranet Devices main page for an understanding of your current data set. See [“Extranet Devices Main Page Fields” on page 751](#) for field descriptions

Configuring Extranet Devices Settings

To configure extranet devices:

1. Select **Configure > IPsec VPN > Extranet Devices**.
2. Click the plus sign (+) to create a new extranet device.

Complete the configuration according to the guidelines provided in Table 1.

3. Click **OK** to save,

Your changes are saved. A new extranet device is added to Security Director.

Table 257: Extranet Device Settings

Setting	Guideline
Name	Enter a name that begins with an alphanumeric character and can include colons, periods, slashes, and underscores, for a maximum length of 63 characters.
Description	Enter a description for the extranet device; maximum length is 1024 characters.
IP Address	Enter the IPv4 address for the extranet device.
Hostname	Enter a DNS resolvable name for the extranet device. This hostname is used to generate an IKE ID. The hostname can include alphanumeric characters, dashes, and underscores, for a maximum length of 64 characters.
Created	Displays the name of the user who created the extranet device.
Domain Name	Displays the user domain for mapping objects and managing sections of a network.

IPsec VPN-Profiles

IN THIS CHAPTER

- [VPN Profiles Overview | 753](#)
- [Creating VPN Profiles | 754](#)
- [Editing and Cloning Policies and Objects | 762](#)
- [Assigning Policies and Profiles to Domains | 763](#)
- [VPN Profiles Main Page Fields | 764](#)

VPN Profiles Overview

You can use a VPN Profile Wizard to create an object that specifies the VPN proposals, mode of the VPN, and other parameters used in a route-based IPsec VPN. You can also configure the Phase 1 and Phase 2 settings in a VPN profile.

When a VPN profile is created, Junos Space creates an object in the Junos Space database to represent the VPN profile. You can use this object to create route-based IPsec VPN.

NOTE: You cannot modify or delete Juniper Networks defined VPN profiles. You can only clone them and create new profiles.

SRX Series devices support preshared key and PKI certificate-based authentication methods in IKE negotiation for IPsec VPNs. The RSA certificate and DSA certificate-based authentication are supported for IKE negotiation. The predefined VPN profile is available with both RSA and DSA certificates-based authentication. The PKI certificate list from the device is automatically retrieved during the device discovery and update-based syslog notifications.

RELATED DOCUMENTATION

| [Creating VPN Profiles | 754](#)

Creating VPN Profiles

Use the VPN Profiles page to configure VPN profiles that define security parameters when establishing a VPN connection. You can reuse the same profile to create more VPN tunnels. The VPN profile includes VPN proposals, VPN mode, authentication, and other parameters used in IPsec VPN. When a VPN profile is created, Junos Space creates an object in the Security Director database to represent the VPN profile. You can use this object to create either route-based or policy-based IPsec VPNs.

NOTE: You cannot modify or delete Juniper Networks defined VPN profiles. You can only clone them and create new profiles.

You can also configure the Internet Key Exchange (IKE) negotiation phases known as Phase 1 and Phase 2 settings in a VPN profile. SRX Series devices support the following authentication methods in IKE negotiations for IPsec VPN:

- Preshared key
- ECDSA certificate
- RSA certificate
- DSA certificate

The predefined VPN profile is available for RSA certificates-based authentication. The PKI certificate list from the device is automatically retrieved during the device discovery.

Before You Begin

- Review the VPN profiles main page for an understanding of your current data set. See [“VPN Profiles Main Page Fields” on page 764](#) for field descriptions.
- Read the [“VPN Profiles Overview” on page 753](#) topic.

Configuring VPN Profiles Settings

To configure a VPN profile:

1. Select **Configure > IPsec VPN > Profiles**.
2. Click the plus sign (+) to create a new VPN profile.
3. Complete the configuration according to the guidelines provided in [Table 259 on page 755](#) and [Table 260 on page 759](#).

A new VPN profile with the predefined VPN configuration is created. You can use this object to create IPsec VPNs.

Table 259: VPN Profiles Settings – Phase 1 IKE Negotiation Configuration

Setting	Guideline
Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores; no spaces allowed; 255-character maximum.
Description	Enter a description for the VPN profile; maximum length is 1024 characters.
<i>Phase 1</i>	
Authentication Type	<p>Select the required authentication type:</p> <ul style="list-style-type: none"> • Preshared key • RSA signature • DSA signature • ECDSA signature (256) • ECDSA signature (384)
Mode	<p>Select a VPN mode:</p> <ul style="list-style-type: none"> • Main—The most common and secure way to establish a VPN when building site-to-site VPNs. The IKE identities are encrypted and cannot be determined by eavesdroppers. • Aggressive—This is an alternative to main mode IPsec negotiation. This is the most common mode when building VPNs from client workstations to VPN gateways, where the IP address of the client is neither known in advance nor fixed.
General-IkeID	<p>Starting Junos Space Security Director Release 16.1, you can enable this option to accept peer IKE ID in general. This option is disabled by default. If General IKE ID is enabled, the IKE ID option is disabled automatically.</p> <p>NOTE:</p> <ul style="list-style-type: none"> • This option is not available in Aggressive VPN mode. • You cannot use a VPN profile with the General IKE ID option enabled for the Auto VPN and ADVPN.

Table 259: VPN Profiles Settings – Phase 1 IKE Negotiation Configuration (*continued*)

Setting	Guideline
IKE Id	<p>Configure the following Internet Key Exchange (IKE) identifiers, as needed:</p> <ul style="list-style-type: none"> • Hostname—The hostname or fully qualified domain name is essentially a string that identifies the end system. • User@hostname—A simple string that follows the same format as an e-mail address. <ul style="list-style-type: none"> • User—Enter the e-mail address of the user. We recommend that you use the valid e-mail address of the user for ease of management. • IPAddress—This is the most common form of IKE identity for site-to-site VPNs. This can be either an IPv4 or IPv6 address. This option is available only if the VPN mode is Aggressive and the authentication type is Preshared Key. • DN—The distinguished name used in certificates to identify a unique user in a certificate. This option is available only for RSA, DSA, and ECDSA signature authentication types. <p>NOTE:</p> <ul style="list-style-type: none"> • For the Preshared Key authentication type: <ul style="list-style-type: none"> • If you have enabled the General IKE ID option, the IKE ID option is automatically set to None and you cannot edit this option. • When modifying a IPsec VPN, you cannot edit the IKE ID column in the View/Edit Tunnel page, if you have chosen a VPN profile with the General IKE ID option enabled. • For the certificate-based authentication type: <ul style="list-style-type: none"> • You can edit the IKE ID option even if you have enabled the General IKE ID option because, the local-identity CLI is used for certificate authentication. • When modifying a IPsec VPN, you can edit the IKE ID column in the View/Edit Tunnel page, if you have chosen a VPN profile with the General IKE ID option enabled.
IKE Version	<p>Select the required IKE version, either V1 or V2, that is used to negotiate dynamic security associations (SAs) for IPsec. By default, IKEv1 is used.</p> <p>Starting in Junos Space Security Director 17.1, IKEv2 message fragmentation allows IKEv2 to operate in environments where IP fragments might be blocked and peers would not be able to establish an IPsec security association (SA). IKEv2 fragmentation splits a large IKEv2 message into a set of smaller ones so that there is no fragmentation at the IP level.</p>
IKE Fragment	<p>On SRX Series devices, IKEv2 fragmentation is enabled by default for IPv4 and IPv6 messages. You can disable the IKEv2 packet fragmentation and, optionally, configure the maximum size of an IKEv2 message before the message is split into fragments that are individually encrypted and authenticated.</p> <p>IKEv2 fragmentation splits a large IKEv2 message into a set of smaller ones so that there is no fragmentation at the IP level. Fragmentation takes place before the original message is encrypted and authenticated, so that each fragment is separately encrypted and authenticated. On the receiver, the fragments are collected, verified, decrypted, and merged into the original message.</p>

Table 259: VPN Profiles Settings – Phase 1 IKE Negotiation Configuration (*continued*)

Setting	Guideline
IKE Fragment Size	<p>Select the maximum size, in bytes, of an IKEv2 message before it is split into fragments. The size applies to both IPv4 and IPv6 messages. Range: 500 to 1300 bytes.</p> <p>Default: 570 bytes for IPv4 messages and 1280 bytes for IPv6 messages</p>
Proposals	<p>Select the type of proposal as either Predefined or Custom. For the Custom proposal, click the plus sign (+) to create a new proposal.</p> <ul style="list-style-type: none"> • Name—Enter the name of the proposal. • DH Group—A Diffie-Hellman (DH) exchange allows the participants to produce a shared secret value. Select the appropriate DH group: <ul style="list-style-type: none"> • Group1 • Group2 • Group5 • Group14 • Group19 • Group20 • Group24 • Authentication—Select an algorithm. The device uses these algorithms to verify the authenticity and integrity of a packet. <ul style="list-style-type: none"> • MD5 • SHA-1 • SHA-256 • SHA-384 • Encryption—Select the appropriate encryption mechanism: <ul style="list-style-type: none"> • 3DES • AES(128) • AES(192) • AES(256) • Lifetime—Select a lifetime of an IKE security association (SA). Default: 3,600 seconds. Range: 180 through 86,400 seconds. <p>NOTE: For the RSA-signature and DSA-signature authentication types, you can only use the custom proposals.</p>

Table 259: VPN Profiles Settings – Phase 1 IKE Negotiation Configuration (*continued*)

Setting	Guideline
Predefined Proposal Sets	<p>If you have opted for the predefined proposal, specify a set of default IKE proposals:</p> <ul style="list-style-type: none"> • Basic <ul style="list-style-type: none"> • Proposal 1—Preshared key, Data Encryption Standard (DES) encryption, and Diffie-Hellman (DH) group 1 and Secure Hash Algorithm 1 (SHA-1) authentication. • Proposal 2—Preshared key, DES encryption, and DH group 1 and Message Digest 5 (MD5) authentication. • Standard <ul style="list-style-type: none"> • Proposal 1—Preshared key, triple DES (3DES) encryption, and Gnutella2 (G2) and SHA-1 authentication. • Proposal 2—Preshared key, 3DES encryption, and DH group 2 and MD5 authentication. • Proposal 3—Preshared key, DES encryption, and DH group 2 and SHA-1 authentication. • Proposal 4—Preshared key, DES encryption, and DH group 2 and MD5 authentication. • Compatible <ul style="list-style-type: none"> • Proposal 1—Preshared key, 3DES encryption, and DH group 2 and SHA-1 authentication. • Proposal 2—Preshared key, Advanced Encryption Standard (AES) 128-bit encryption, and DH group 2 and SHA-1 authentication.
<i>Advanced Settings</i>	
NAT Traversal	<p>NAT-T is an IKE phase 1 algorithm that is used when trying to establish a VPN connection between two gateway devices, where a NAT device exists in front of one of the devices (in this case a Juniper Firewall device). By enabling this option, IPsec traffic can pass through a NAT device.</p> <p>By default, NAT-T is enabled on SRX Series devices. You must explicitly clear the Enable check box to turn it off on a gateway-by-gateway basis.</p> <ul style="list-style-type: none"> • Keepalive Interval (secs)—Select the appropriate keepalive interval in seconds. If the VPN is expected to have large periods of inactivity, these keepalives are configured to generate artificial traffic to keep the session active on the NAT devices. <p>Range: 1 through 300 seconds.</p>

Table 259: VPN Profiles Settings – Phase 1 IKE Negotiation Configuration (*continued*)

Setting	Guideline
DPD	<p>Select the check box to permit the two gateways to determine if the peer gateway is up and responding to the DPD messages that are negotiated during IPsec establishment.</p> <ul style="list-style-type: none"> • Always Send DPD—Enable this option to send dead peer detection requests regardless of whether there is outgoing IPsec traffic to the peer. • DPD Interval (secs)—Select an interval in seconds to send dead peer detection messages. The default interval is 10 seconds, with a permissible range of 10 to 60 seconds. • DPD Threshold—Select a number from 1 to 5 to set the failure DPD threshold. This specifies the maximum number of times the DPD messages must be sent when there is no response from the peer. The default number of transmissions is 5 times.

Table 260: VPN Profiles Settings – Phase 2 IKE Negotiation Configuration

Setting	Guideline
Proposal	<p>Select the type of proposal as either Predefined or Custom. For the Custom proposal, click the plus sign (+) to create a new proposal.</p> <ul style="list-style-type: none"> • Name—Enter the name of the custom proposal. • Authentication—Select an algorithm. The device uses these algorithms to verify the authenticity and integrity of a packet. <ul style="list-style-type: none"> • MD5 • SHA-1 • SHA-256(96) • SHA-256(28) • Protocol—Select the required protocol to establish the VPN. • Encryption—Select the necessary encryption method: <ul style="list-style-type: none"> • DES • 3DES • AES(128) • AES(192) • AES(256) • AES-GCM(128) • AES-GCM(192) • AES-GCM(256) • Lifetime—Select a lifetime of an IKE security association (SA). Default: 3,600 seconds. Range: 180 through 86,400 seconds. • Life Size—The lifetime of the SA, after which it expires, expressed in kilobytes.

Table 260: VPN Profiles Settings – Phase 2 IKE Negotiation Configuration (*continued*)

Setting	Guideline
Predefined Proposal Sets	<p>Select the appropriate predefined proposal set:</p> <ul style="list-style-type: none"> • Basic • Standard • Compatible • SuiteB-GCM-128 <ul style="list-style-type: none"> • ESP—Advanced Encryption Standard (AES) encryption with 128-bit keys and 16-octet integrity check value (ICV) in Galois Counter Mode (GCM). • IKE—AES encryption with 128-bit keys in cipher block chaining (CBC) mode, integrity using SHA-256 authentication, and key establishment using Diffie-Hellman (DH) group 19 and authentication using Elliptic Curve Digital Signature Algorithm (ECDSA) 256-bit elliptic curve signatures. • SuiteB-GCM-256 <ul style="list-style-type: none"> • ESP—AES encryption with 256-bit keys and 16-octet ICV in GCM for ESP. • IKE—AES encryption with 256-bit keys in CBC mode, integrity using SHA-384 authentication, and key establishment using DH group 20 and authentication using ECDSA 384-bit elliptic curve signatures.
Perfect Forward Secrecy	<p>Specify Perfect Forward Secrecy (PFS) as the method that the device uses to generate the encryption key. PFS generates each new encryption key independently from the previous key. The higher numbered groups provide more security, but require more processing time.</p> <p>The available options are:</p> <ul style="list-style-type: none"> • Group1 • Group2 • Group5 • Group14 • Group19 • Group20 • Group24
<i>Advanced Settings</i>	
Establish tunnel immediately	<p>Enable this option to establish the IPsec tunnel. IKE is activated immediately after VPN configuration and configuration changes are committed.</p>

Table 260: VPN Profiles Settings – Phase 2 IKE Negotiation Configuration (*continued*)

Setting	Guideline
VPN Monitor	<p>Enable this option to send Internet Control Message Protocol (ICMP) to determine if the VPN is up.</p> <ul style="list-style-type: none"> VPN Optimized—This is the VPN monitoring option. It sends only the ICMP traffic through the tunnel where there is an absence of user traffic.
DF bit	<p>Enable this option to process the Don't Fragment (DF) bit in IP messages. You can set it to copy, clear, or set the bits to the IPsec header.</p> <p>Select the following options:</p> <ul style="list-style-type: none"> None—No action. Clear—Clear (disable) the DF bit from the IP messages. This is the default. Copy—Copy the DF bit to the IP messages. Set—Set (enable) the DF bit in the IP messages.
Idle time (secs)	Select the appropriate idle time interval from the selector. The sessions and their corresponding translations typically time out after a certain period of time if no traffic is received.
Install Time	Specify the maximum number of seconds to allow for the installation of a rekeyed outbound security association (SA) on the device. Select a value from 1 to 10.
Anti Replay	By default, Anti-Replay detection is enabled. IPsec protects against the VPN attack by using a sequence of numbers that are built into the IPsec packet—the system does not accept a packet for which it has already seen the same sequence number. It essentially checks the sequence numbers and enforces the check, rather than just ignoring the sequence numbers. Disable it if there is an error with the IPsec mechanism that results in out-of-order packets, preventing proper functionality.

Release History Table

Release	Description
17.1	Starting in Junos Space Security Director 17.1, IKEv2 message fragmentation allows IKEv2 to operate in environments where IP fragments might be blocked and peers would not be able to establish an IPsec security association (SA).
16.1	Starting Junos Space Security Director Release 16.1, you can enable this option to accept peer IKE ID in general.

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared objects:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

RELATED DOCUMENTATION

[Creating Firewall Policies | 358](#)

[Creating NAT Policies | 567](#)

[Creating IPS Policies | 507](#)

Assigning Policies and Profiles to Domains

You can assign or reassign policies or profiles to different domains when it is first configured and whenever you want to implement a change. You can assign only one policy or profile at a time. Before assigning a policy or profile to another domain, Security Director checks for the validity of the move. If the move is not acceptable, a warning message appears.

To assign a policy or profile to a domain:

1. Select **Configure** and select the landing page for the type of policy or profile that you are assigning to a domain.

2. From the landing page, right-click the policy or profile or click **More**.

A list of actions appears.

3. Select **Assign <Policy or Profile> to Domain**.

The Assign <Policy or Profile> to Domain page appears.

NOTE: <Policy or Profile> is the name of the policy or profile that you are assigning to a domain.

4. Select the required items to assign to a domain.
5. Enable this option to ignore warning messages, if any.
6. Click **Assign**.

A policy or profile is assigned to a domain.

VPN Profiles Main Page Fields

Use the VPN profiles main page to get an overall, high-level view of your VPN settings. You can filter and sort this information to get a better understanding of what you want to configure. [Table 261 on page 764](#) describes the fields on this page.

Table 261: VPN Profiles Main Page Fields

Field	Description
Name	Name of the VPN profile.
Type	A VPN profile type can be predefined or custom. Security Director comes with predefined proposal sets for both Phase 1 and Phase 2 IKE negotiations. You can use these predefined sets or create your own.
Description	Description of the VPN profile.
Mode	Phase1 IKE negotiation mode (main or aggressive) is used to determine the type and number of message exchanges that occur in a phase. Only one mode is used for negotiation, and the same mode must be configured on both sides of the tunnel.
Created By	User who created the VPN profile.
Domain Name	User domain for mapping objects and managing sections of a network.

Shared Objects-Geo IP

IN THIS CHAPTER

- [Creating Geo IP Policies | 765](#)
- [Geo IP Overview | 767](#)
- [Deleting and Replacing Policies and Objects | 767](#)

Creating Geo IP Policies

To access this page, click **Configure>Shared Objects>Geo IP**.

You can create Geo IP policies from the Geo IP policies page.

- You must have a Sky ATP account to receive Geo IP feeds. Make sure you configure the necessary steps for Sky ATP before creating a Geo IP policy.
- Geo IP filtering is a useful tool when you are experiencing certain types of attacks, such as DDOS from specific geographical locations.
- If you are using Sky ATP without Policy Enforcer, you must select your Geo IP policy as the source and/or destination of a firewall rule to apply it.

To create a Geo IP policy:

1. Select **Configure>Shared Objects>Geo IP**.
2. Click the + icon.
3. Complete the configuration by using the guidelines in [Table 262 on page 765](#) below.
4. Click **OK**.

Table 262: Fields on the Geo IP Policy Page

Name	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
------	--

Table 262: Fields on the Geo IP Policy Page (continued)

Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.
Countries	Select the check box beside the countries in the Available list and click the > icon to move them to the Selected list. The countries in the Selected list will be included in the policy and action will be taken according to their threat level.
Block Traffic	Choose what traffic to block from the selected countries. Incoming traffic, Outgoing traffic, or Incoming and Outgoing traffic. (Policy Enforcer only)
Log Setting	Choose to log all traffic or only blocked traffic. (Policy Enforcer only)

Once you have a Geo IP policy, you assign it to one more groups (Policy Enforcer only):

1. In the Group column, click the **Assign to Groups** link that appears here when there are no groups assigned or click the group name that appears in this column to edit the existing list of assigned groups.
2. In the Assign to Groups page, select the check box beside a group in the Available list and click the > icon to move it to the Selected list. The groups in the Selected list will be assigned to the policy.
3. Click **OK**.
4. Once one or more groups have been assigned, a **Ready to Update** link appears in the Status column. You must update to apply your new or edited policy configuration. Clicking the Ready to Update link takes you the Threat Policy Analysis page. See [“Threat Policy Analysis Overview” on page 679](#). From there you can view your changes and choose to Update now, Update later, or Save them in draft form without updating.
5. If you are using Sky ATP without Policy Enforcer, you must select your Geo IP policy as the source and/or destination of a firewall rule. Navigate to **Configure > Firewall Policy > Policies**.

Geo IP Overview

Geo IP refers to the method of locating a computer terminal's geographic location by identifying that terminal's IP address. A Geo IP feed is an up-to-date mapping of IP addresses to geographical regions. By mapping IP address to the sources of attack traffic, geographic regions of origin can be determined, giving you the ability to filter traffic to and from specific locations in the world.

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

Shared Objects-Policy Enforcement Groups

IN THIS CHAPTER

- Creating Policy Enforcement Groups | 769
- Policy Enforcement Groups Overview | 771
- Deleting and Replacing Policies and Objects | 772

Creating Policy Enforcement Groups

To access this page, click **Configure>Shared Objects>Policy Enforcement Groups**.

You can create policy enforcement groups from the policy enforcement groups page.

- Know what type of endpoints you are including in your policy enforcement group: IP address/subnet, or location.
- Determine what endpoints you will add to the group based on how you will configure threat prevention according to location, users and applications, or threat risk.
- Keep in mind that endpoints *cannot* belong to multiple policy enforcement groups.

To create a policy enforcement group:

1. Select **Configure>Shared Objects>Policy Enforcement Groups**.
2. Click the + icon.
3. Complete the configuration by using the guidelines in the [Table 263 on page 770](#) below.
4. Click **OK**.

Table 263: Fields on the Policy Enforcement Group Page

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include only dashes and underscores; no spaces allowed; 32-character maximum.
Description	Enter a description; maximum length is 64 characters. You should make this description as useful as possible for all administrators.
Group Type	Select a group type from the available choices. IP Address/Subnet or Location.
Connector IPs	<p>This field is available only if the Group Type field is IP Address/Subnet</p> <p>The subnets of all connectors added in the Connector page are dynamically listed in the Available column. If the Group Type is IP Address/Subnet, the subnets within the connector instances that have the threat remediation enabled are only listed.</p> <p>When using Junos Space, Policy Enforcer is able to dynamically discover subnets configured on Juniper switches. Policy Enforcer does not have the same insight with third-party devices. Therefore you can add subnets to your connector configuration and select them here. This allows you to selectively apply policies to those subnets.</p> <p>If you have not configured a connector, you will see only Junos Space subnets discovered by Policy Enforcer. If you have a connector configured, you can see the subnets of a connector in the Available column. Hover over subnets to view the description for these subnets entered during the connector creation. You will not see any description if it is not entered during creating a connector. The description will show "No description available" for subnets that come from Junos Space.</p> <p>The Available and Selected columns have filters listed with connectors or Space. You can choose a connector and filter only the subnets belonging to that particular connector. The result shows the name of a device to which the subnet belongs and also the type of the device.</p> <p>You can also use the search bar to search and filter the result based on subnet, name of the device, or type of the device.</p> <p>Click Refresh Available IPs to refresh the available IP addresses or subnets. If you edit any selected items in the Selected column, the list is refreshed to the initial selected list after the refresh. A progress bar is shown with the refresh progress in percentage.</p> <p>In a scenario where there are no IP addresses or subnets, the refresh will still be successful. A message is displayed showing that the refresh was successful but there are no IP addresses or subnets found.</p>

Table 263: Fields on the Policy Enforcement Group Page (*continued*)

Field	Description
Additional IP	<p>This field is available only if the Group Type field is IP Address/Subnet</p> <p>Enter an IP address and select the connector type from the list to add to PEG. The IP address must be within the subnet range of the selected connector. Click Add to add the additional IP address to the Selected column of the Connector IPs field.</p> <p>A validation is performed to check if the additional IP address is within the subnet range of the selected connector. If not, an error message is shown to enter the IP address within the subnet range.</p>
Sites	<p>Sites with the threat remediation enabled instances are only listed, if the Group Type is Location. Select the check box beside the sites in the Available list and click the > icon to move them to the Selected list.</p> <p>The endpoints in the Selected list will be included in the policy enforcement group.</p>

You can create a policy enforcement group with subnets from different connectors based on how they have grouped their network segments. For example, If you have Junos Space EX switch with subnets HR: 1.1.1.1/24 and Finance: 2.2.2.2/24, ClearPass connector with subnets HR: 1.1.1.1/24 and Marketing: 2.2.2.2/24, Cisco ISE with subnets HR: 1.1.1.1/24 and Finance: 2.2.2.2/24. You can create a single policy enforcement group and name it as HR by choosing the following subnets: Junos Space EX HR: 1.1.1.1/24, ClearPass connector subnet HR: 1.1.1.1/24, and Cisco ISE connector subnet HR: 1.1.1.1/24.

Addresses and Address Groups Overview

Addresses specify an IP address or a hostname. You can create addresses that can be used across all devices managed by Security Director. Addresses are used in firewall, NAT, IPS, and VPN services and apply to corresponding SRX Series devices. If you only know the hostname, you enter it into the Hostname field and use the address resolution option to resolve it to an IP address. You can also resolve an IP address to the corresponding hostname.

Once you create an address, you can combine it with other addresses to form an address group. Address groups are useful when you want to apply the same policy to multiple addresses.

Security Director manages its address book at the global level, assigning objects to devices that are required to create policies. An address book is a collection of addresses and address groups that are available in a security zone. If the device is capable of using a global address book, Security Director pushes address objects used in the policies to the device global address book.

Creating Addresses and Address Groups

Use the Addresses page to create addresses that can be used across all devices managed by Security Director. Addresses are used in firewall, NAT, IPS, and VPN services and apply to corresponding SRX Series devices.

Once you create an address, you can combine it with other addresses to form an address group. Address groups are useful when you want to apply the same policy to multiple devices.

Before You Begin

- Read the topic.
- Decide on the type of address object to define: Host, Range, Network, Wildcard, or DNS Host.
- Review the addresses main page for an understanding of your current data set. See [“Addresses Main Page Fields” on page 781](#) for field descriptions.

Configuring Addresses and Address Groups

To create an address object:

1. Select **Configure > Shared Objects > Addresses**.
2. Click **Create**.
3. Complete the configuration according to the guidelines provided in Tables 1 through 2.
4. Click **OK**.

A new address or address group with your configurations is created. You can use this object in policies. You can also assign it to a domain; see [Assigning Policies and Profiles to Domains](#).

Table 264: Fields on the Create Addresses Page

Setting	Guideline
Object Type	Select Address or Address Group. If you select Address Group, then the screen changes so you can select the addresses you want to include in your address group. Table 265 on page 778 describes address group configuration parameters.
Name	Enter a unique name for the address. It must begin with an alphanumeric character and cannot exceed 63 characters. Dashes and underscores are allowed.
Description	Enter a description for your address; maximum length is 1,024 characters. You should make this description as useful as possible for all administrators.

Table 264: Fields on the Create Addresses Page (*continued*)

Setting	Guideline
Type	<p>Select a type of address and fill in the corresponding fields. Available types are:</p> <ul style="list-style-type: none"> • Host <ul style="list-style-type: none"> • Host IP—Enter the IPv4 or IPv6 host IP address. For example: 1.2.3.4 or 0:0:0:0:FFFF:0102:0304. If you do not know the IP address, you can enter the hostname and click Look up hostname. • Hostname—Enter the hostname. It must begin with an alphanumeric character and cannot exceed 63 characters. Dashes and underscores are allowed. If you do not know the host name, you can enter the IP address and click Look up IP address. For example, enter www.company.com and click Look up IP address. Hostname lookup is supported for IPv4 and IPv6 addresses. • Range <ul style="list-style-type: none"> • Start Address—Enter a starting IPv4 or IPv6 address for the address range. For example: 10.0.0.0 or 0:0:0:0:FFFF:A00:0. • End Address—Enter an ending IPv4 or IPv6 address for the address range. The range is validated once you enter the address. <p>NOTE: An address range is configured on managed device(s) as address-set with one or more network address objects covering the specified address range. Security Director supports range address objects in 'mem*' format.</p> • Network <ul style="list-style-type: none"> • Network—Enter the network IP address. For example: 10.0.0.0. IPv6 is also supported. For example: 4001:334:244:2255:24a2:244:: • Subnet Mask—Enter the subnet mask for the network range. For example, IPv4 netmask: 10.0.0.0/24. The subnet mask is validated as you enter it. You should enter the correct subnet mask in accordance with the network value. For example, IPv6 netmask: 4001:334:244:2255:24a2:244:: / 126. • Wildcard <ul style="list-style-type: none"> • Network—Enter the network IPv4 or IPv6 address. For example: 1.2.3.4 or 2001:4860:800f::68 • Wildcard Mask—Enter the wildcard mask for the network range. For example: 0.0.0.255. • DNS Host <ul style="list-style-type: none"> • DNS Name—Enter the DNS name. For example: company.com. Only alphanumeric characters, dashes, and periods are accepted. This name cannot exceed 69 characters and must end with an alphanumeric character.
Assign Metadata	<p>Select the required metadata from the list to assign to an address object.</p> <p>Only host and range address types are supported.</p> <p>When associating the address (host or range) with metadata, you can use only AND operator.</p> <p>For example: Location = Bangalore AND Location = Chennai AND Zone = East.</p>

Table 265: Address Group Settings

Setting	Guideline
Object Type	Select Address Group. When you select Address Group, then the screen changes so you can select the addresses you want to include in your address group.
Name	Enter a unique name for the address group. It must begin with an alphanumeric character and cannot exceed 63 characters. Dashes and underscores are allowed.
Description	Enter a description for your address group. You should make this description as useful as possible for all administrators.
Addresses	Select the check box beside each address you want to include in the address group. Click the arrow to move the selected address or addresses from the Available column to the Selected column. Note that you can use the fields at the top of each column to search for addresses.

Importing and Exporting CSV Files

You can export all the columns on the Security Director Devices page to a comma-separated value (.csv) file. You can also import the address objects from the already exported CSV file.

Importing from a CSV file

To import the address objects from an already exported CSV file from the same or different Junos Space Network Management Platform server:

1. Select **Configure** and select the landing page for type of configuration object you are importing.
2. From the landing page, click **More**.
A list of actions appears.
3. Select **Import from CSV**.
The Select **CSV File** window appears.
4. Click **Browse** to locate the CSV file you are importing.
5. Click **Import**.

NOTE:

- If the CSV file is corrupted or there is no reference for the address group, Security Director deletes those respective address objects.
- We recommend that you do not make any modifications to the exported CSV file with address objects.

Exporting to a CSV File

To export configurations to a CSV file:

1. Select **Configure** and select the landing the page for the configuration(s) object you are exporting.
2. Select the check box(es) beside the item(s) you want to export. Click **More** or right click on the page.
A list of actions appears.
3. Select **Export to CSV**.
The Select **CSV File** window appears.
4. Click **Export All** or **Export Selected**.
The Export CSV Job Status page appears.
5. When the export file is ready, click the provided link in the CSV Job Status page to download the file.
You can also access the download link in the job manager.

RELATED DOCUMENTATION

[Creating IPS Policies | 507](#)

Assigning Addresses and Address Groups to Domains

You can assign or reassign addresses to different domain. You can assign only one address at a time; multiple selections are not allowed. Before assigning an address to other domains, Security Director checks for the validity of the move. For example, you cannot move an address in the Global domain to a child domain, if it is used by a policy in the Global domain. A warning message is shown for such scenarios.

To assign an address to a domain:

1. Select **Configure and Provision > Shared Objects > Addresses**.

The Address page appears.

2. Select the address or address group, right click and select **Assign Address to Domain**.

The Assign Address to Domain page appears.

3. Select the domain assignment.

4. Click **Assign**.

The selected domain is assigned to the address.

Showing Duplicate Policies and Objects

To display duplicate objects:

1. Select the check box beside the object(s).

2. Right click and select **Show Duplicates**.

The Show Duplicates page appears.

3. Select the check box beside the duplicate object, click **Delete** and confirm to remove it.

Addresses Main Page Fields

Use address and address groups to define policies across devices. Addresses are a combination of IP addresses, hostnames, and domains and once created, can be combined to form address groups.

Table 266: Addresses Main Page Fields

Field	Description
Name	Name of the address or address group.
Type	Type determines how the address is defined: host, range, network, wildcard, DNS host, or address group.
Hostname	Name of the host for the selected type.
IP Address	IP address of the host for the selected type or members of the address group.
Description	Description of your address or address group.
Domain	Domain or child domain of the address or address group.

Shared Objects-Services

IN THIS CHAPTER

- [Services and Service Groups Overview | 782](#)
- [Creating Services and Service Groups | 783](#)
- [Showing Duplicate Policies and Objects | 788](#)

Services and Service Groups Overview

A service in Security Director refers to an application on a device. For example, Domain Name Service (DNS). Services are based on protocols and ports used by an application, and when added to a policy, a configured service can be applied across all devices managed by Security Director. The protocols used to create a service include: TCP, UDP, MS-RPC, SUN-RPC, ICMP, and ICMPv6. Security Director also includes predefined, commonly used services, and you cannot modify or delete them.

Once you create a service, you can combine it with other services to form a service group. Service groups are useful when you want to apply the same policy to multiple services. This lets you create fewer policies.

Note that Security Director manages services in the same way it manages addresses, by always deleting the unused services (those services that are not referenced by any policy on the device) from the device during publish or update. If the option is disabled, Security Director will never try to delete a service from the device, even if that service is unused.

Creating Services and Service Groups

A service in Security Director refers to an application on a device, such as Domain Name Service (DNS). Services are based on protocols and ports used by an application, and when added to a policy, a configured service can be applied across all devices managed by Security Director. Once you create a service, you can combine it with other services to form a service group. Service groups are useful when you want to apply the same policy to multiple services.

The protocols available to create a service include: TCP, UDP, SUN-RPC, MS-RPC, ICMP, ICMPv6, and Other.

During a device update, you can delete all unused services and service groups by selecting an option available under Update Device in Junos Space. By default, this option is enabled when you perform a fresh install of Security Director or upgrade from the previous release.

NOTE: There are Juniper Networks defined service objects for commonly used services, but you cannot modify or delete them. These services appear when you install a fresh version of Security Director.

Before You Begin

- Read the topic.
- Gather all the information for the protocols you are using to create the service, including source and destination ports and protocol type such as TCP or UDP.
- Check to see if cloning an existing service might be more efficient than creating a new one.
- Review the services main page for an understanding of your current data set. See for field descriptions.

Configuring Services and Service Groups

To configure a service:

1. Select **Configure > Shared Objects > Services**.
2. Click **Create**.

3. Complete the configuration according to the guidelines in Tables 1 through 3.

4. Click **OK**.

A new service or service group with your configurations is created. You can use this object in policies. You can also assign it to a domain; see [Assigning Policies and Profiles to Domains](#).

Table 267: Service Settings

Setting	Guideline
<i>General Information</i>	
Object Type	Select Service or Service Group. If you select Service Group, then the screen changes so you can select the services you want to include in your service group.
Name	Required. Enter a unique name for the service. It must begin with an alphanumeric character and cannot exceed 63 characters. Dashes and underscores are allowed.
Description	Enter a description for your service. You should make this description as useful as possible for all administrators.
<i>Create Protocol</i>	
Name	Enter a unique name for the protocol. It must begin with an alphanumeric character and cannot exceed 63 characters. Dashes and underscores are allowed.
Description	Enter a description for your protocol. It cannot exceed 1,024 characters.
Type	Select a type of protocol and fill in the corresponding fields. Available types are: TCP, UDP, ICMP, SUN-RPC, MS-RPC, ICMPv6, and Other. If you select TCP, continue with this table. See Table 2 for the other protocol types.
Destination Port	Enter a destination port number for TCP. This is a value or value range from 0 through 65,535.
<i>Advanced Settings</i>	
Enable Inactivity Timeout	Selected by default. Enter a timeout value for this protocol in seconds or minutes. The maximum values are 129,600 seconds and 2,160 minutes.
ALG	Select an ALG (Application Layer Gateway) service option if applicable.
Source Ports and Port Ranges	Enter the source port or port range for the protocol.

Table 2 includes the settings and guidelines for the various protocol types.

Advanced Settings

Table 268: Create Protocol Type Settings

Setting	Guideline
<i>UDP</i>	
Destination Port	Enter a destination port number for UDP. This is a value or value range from 0 through 65,535.
<i>Advanced Settings</i>	
Enable Inactivity Timeout	Selected by default. Enter a timeout value for this protocol in seconds or minutes. The maximum values are 129,600 seconds and 2,160 minutes.
ALG	Select an ALG (Application Layer Gateway) service option if applicable.
Source Ports and Port Ranges	Enter a source port or port range for UDP. This is a value or value range from 0 through 65,535.
<i>ICMP</i>	
Enable Inactivity Timeout	Selected by default. Enter a timeout value for this protocol in seconds or minutes. The maximum values are 129,600 seconds and 2,160 minutes.
ICMP Type	Enter a value from 0 through 225 for the ICMP message type. For example, enter 1 for host unreachable. You can find these values in RFC 792.
ICMP Code	Enter a value from 0 through 225 for the ICMP code. For example, enter 0 for echo reply. You can find these values in RFC 792.
<i>SUN-RPC</i>	
Destination Port (available if Enable ALG is selected)	Enter a destination port for SUN-RPC. This is a value or value range from 0 through 65,535.
Enable Inactivity Timeout	Selected by default. Enter a timeout value for this protocol in seconds or minutes. The maximum values are 129,600 seconds and 2,160 minutes.
Enable ALG	Not selected by default. If you enable ALG for this protocol, you must enter a destination port in the field that becomes available.

Table 268: Create Protocol Type Settings (*continued*)

Setting	Guideline
RPC Program Number	Enter a value or value range for the RPC (remote procedure call) service. For example, enter 100,017 for remote execution. You can find these values in RFC 5531.
Protocol Type	Select TCP or UDP for the protocol type.
<i>MS-RPC</i>	
Destination Port (available if Enable ALG is selected)	Enter a destination port for MS-RPC. This is a value or value range from 0 through 65,535.
Enable Inactivity Timeout	Selected by default. Enter a timeout value for this protocol in seconds or minutes. The maximum values are 129,600 seconds and 2,160 minutes.
Enable ALG	Not selected by default. If you enable ALG for this protocol, you must enter a destination port number in the field that becomes available.
UUID	Enter the corresponding UUID value for the MS-RPC service. For predefined values, refer to MS-RPC UUID Mappings.
Protocol Type	Select TCP or UDP for the protocol type.
<i>ICMPv6</i>	
Enable Inactivity Timeout	Selected by default. Enter a timeout value for this protocol in seconds or minutes. The maximum values are 129,600 seconds and 2,160 minutes.
ICMP Type	Enter a value from 0 through 225 for the ICMPv6 message type. You can find these values in RFC 4443.
ICMP Code	Enter a value from 0 through 225 for the ICMPv6 code. You can find these values in RFC 4443.
Destination Port	Use other to create protocols that do not match the provided type categories. Enter a destination port for the other protocol. This is a value or value range from 0 through 65,535.
<i>Advanced Settings</i>	
Enable Inactivity Timeout	Selected by default. Enter a timeout value for this protocol in seconds or minutes. The maximum values are 129,600 seconds and 2,160 minutes.

Table 268: Create Protocol Type Settings (*continued*)

Setting	Guideline
ALG	Select an ALG (Application Layer Gateway) service option if applicable.
Source Ports and Port Ranges	Enter the source port or port range for the other protocol.
Protocol Number	Enter a protocol number for the protocol type. RFC 791 contains a list of protocols and their corresponding numbers. This number identifies the service in the next higher level in the protocol stack to which data is passed.

Table 3 includes the settings and guidelines for service groups.

Table 269: Service Group Settings

Setting	Guideline
<i>General Information</i>	
Object Type	Select Service Group. When you select Service Group, then the screen changes so you can select the services you want to include in your service group.
Name	Enter a unique name for the service group. It must begin with an alphanumeric character and cannot exceed 63 characters. Dashes and underscores are allowed.
Description	Enter a description for your service group. You should make this description as useful as possible for all administrators.
Services	Select the check box beside each service you want to include in the service group. Click the arrow to move the selected service or services from the Available column to the Selected column. Note that you can use the fields at the top of each column to search for listed services.

Variables Overview

A variable is useful when similar rules can be applied across devices where only the zone or address might differ. Using variables instead of static values allows you to create fewer rules and use them more widely. You can achieve this by creating a variable address or a variable zone that you configure for all devices to which you are applying a group policy.

For example:

- Group firewall policy FW-G1 has two devices, Dev-1 and Dev-2. Each device has its own unique address. Dev-1 has address A1. Dev-2 has address A2.
- You want to apply the same rule to both devices, but you do not want to configure two rules with all the same criteria except for the address. It is more efficient to configure one rule with a variable default address and apply it to both devices.
- You can achieve this by creating an address variable with a default address, A3, and making A3 common to Dev-1 and Dev-2 in your rule. When you configure default address A3, you map it to the real address of each device, A1 for Dev-1 and A2 for Dev-2.
- When group firewall policy FW-G1 is applied, these mappings are used to replace the default address with the real address for each device.

Variables are only used in group policies. They are not applicable to device policies.

Creating Variables

Use variables to dynamically obtain addresses and zones in group firewall policies that are applied to multiple devices. A variable is useful when similar rules can be used across devices where only the zone or address might differ. Using variables instead of static values allows you to create fewer rules and use them more widely.

When you configure variables, you map specific devices to configured values and default values are replaced by these mapping when policies are applied. Note that variables are only used in group policies. They are not applicable to device policies.

Before You Begin

- Read the topic.
- Decide on the type of variable to define, either address or zone.
- Check to see if cloning an existing variable might be more efficient than creating a new one.
- Review the Variables main page for an understanding of your current data set. See for field descriptions.

Configuring Variables

To create a variable object:

1. Select **Configure > Shared Objects > Variables**.
2. Click **Create**.
3. Complete the configuration according to the guidelines provided in Tables 1 through 3.
4. Click **OK**.

A new variable with your configurations is created. You can use this object in policies. You can also assign it to a domain; see Assigning Policies and Profiles to Domains.

Table 270: Variable Profile Settings

Setting	Guideline
Name	Enter a unique name for this variable. It must begin with an alphanumeric character and cannot exceed 63 characters. Dashes and underscores are allowed.
Description	Enter a description for your variable; maximum length is 1,024 characters. You should make this description as useful as possible for all administrators.
Type	Select a type of variable and fill in the corresponding fields. Available types are: Address or Zone. When you select a type, the required fields for that type are shown. See Table 2 for address types. See Table 3 for zone types.

Table 271: Create Variable Address Profile Setting

Setting	Guideline
Default Address	Select a predefined address by clicking anywhere within this field and choosing an address from the Select Address window or click Add to create a new default address. This default address is replaced with the mapped device-specific address when applied to the group firewall policy.

Table 271: Create Variable Address Profile Setting (continued)

Setting	Guideline
Context Value	Select the check box beside each device to which you want to map this variable address. Click the arrow to move the selected device or devices from the Available column to the Selected column. Only devices from the current and child domain are listed. Note that you can use the fields at the top of each column to search for listed devices.
Address	Select a predefined address by clicking anywhere within this field and choosing an address from the Select Address window. The default address is replaced by this device-specific address when applied to a policy that includes the selected device or devices.

Table 272: Create Zone Profile Settings

Setting	Guideline
Default Zone	Enter a zone. This default zone is replaced with the mapped zone when applied to the group firewall policy. The default value is trust .
Context Value	Select the check box beside each device to which you want to map this variable zone. Click the arrow to move the selected device or devices from the Available column to the Selected column. Note that you can use the fields at the top of each column to search for listed devices.
Zone	<p>For SRX Series devices, select a zone from the list. The default zone is replaced by this device-specific zone when applied to a policy that includes the selected device or devices.</p> <p>Starting in Junos Space Security Director Release 16.2, if you select an MX Series router, the Zone field lists all the AMS interfaces that are assigned to the service set. If you select both SRX Series devices and MX Series routers, both zones and AMS values are listed.</p>

Release History Table

Release	Description
16.2	Starting in Junos Space Security Director Release 16.2, if you select an MX Series router, the Zone field lists all the AMS interfaces that are assigned to the service set. If you select both SRX Series devices and MX Series routers, both zones and AMS values are listed.

Editing Variables

To edit a variable:

1. Select **Configure and Provision > Shared Objects > Variables**.

The Variables page appears.

2. Select the address or zone variable you want to edit and click **Edit**.

The Edit Variable page appears.

3. Edit the variable as needed, including the name, description, default address, context value, and (mapped) address for an address variable. For a zone variable, you can edit the name, description, default zone, context value, and (mapped) zone.

4. Click **OK** to save the changes.

Importing and Exporting CSV Files

To import configurations from a CSV file:

1. Select **Configure** and select the landing page for type of configuration object you are importing.

2. From the landing page, click **More**.

A list of actions appears.

3. Select **Import from CSV**

The Select **CSV File** window appears.

4. Click **Browse** to locate the CSV file you are importing.
5. Click **Import**.

To export configurations to a CSV file:

1. Select **Configure** and select the landing the page for the configuration(s) object you are exporting.
2. Select the check box(es) beside the item(s) you want to export. Click **More** or right click on the page. A list of actions appears.
3. Select **Export to CSV**
The **Select CSV File** window appears.
4. Click **Export All** or **Export Selected**.
The **Export CSV Job Status** page appears.
5. When the export file is ready, click the provided link in the **CSV Job Status** page to download the file.
You can also access the download link in the job manager.

Showing Duplicate Policies and Objects

To display duplicate objects:

1. Select the check box beside the object(s).
2. Right click and select **Show Duplicates**.
The **Show Duplicates** page appears.
3. Select the check box beside the duplicate object, click **Delete** and confirm to remove it.

Understanding Zone Sets

Security zones are the building blocks for policies; they are logical entities to which one or more interfaces are bound. Security zones provide a means of distinguishing groups of hosts (user systems and servers) and their resources from one another to apply different security measures to them.

A zone set is a grouping of two or more zones in a network to regulate and secure the traffic through the security platform running Junos OS. With zone-based security, you can define multiple security zones, group similar interfaces, and apply the same policies to all zones. Zone sets are referenced in the global firewall group to avoid creating multiple policies across every possible interface.

NOTE: In Security Director, a zone set is a group of multiple zones and not a device-level object.

Figure 65 on page 796 shows a zone set with three zones, Zone 1, Zone 2, and Zone 3. Zone 1 provides access from hosts H1 and H3 to the data residing on server S1. Zone 2 provides access from host H3 to the data residing on server S2. Zone 3 provides access from host H2 to the data residing on server S2.

Figure 65: Hierarchy of Zone Set, Zones, and Zone Members

Interfaces act as a doorway through which traffic enters and exits a Juniper Networks device. Many interfaces can share exactly the same security requirements; however, different interfaces can also have different security requirements for inbound and outbound data packets. Interfaces with identical security requirements can be grouped together into a single security zone. See [Figure 66 on page 796](#), which shows a basic zone topology that includes a router connected to three interfaces.

Figure 66: Basic Zone Topology

[Figure 66 on page 796](#) shows a basic zone topology with three zones, private LAN, DMZ, and public Internet. A router within the zone to three interfaces:

- One interface connected to the public Internet
- One interface connected to a private LAN that must not be accessible from the public Internet

- One interface connected to an Internet service demilitarized zone (DMZ), where a webserver, Domain Name System (DNS) server, and e-mail server must be accessible to the public Internet

Each interface in this network is assigned to its own zone, although you might want to allow varied access from the public Internet to specific hosts in the DMZ and varied application use policies for hosts in the protected LAN.

In this network, there are three main policies:

- Private zone connectivity to the Internet
- Private zone connectivity to DMZ hosts
- Internet zone connectivity to DMZ hosts

If an additional interface is added to the private zone, the hosts connected to the new interface in the zone can pass traffic to all hosts on the existing interface in the same zone. Also, the traffic from the hosts to hosts in other zones is similarly affected by existing policies.

Creating Zone Sets

Use zone sets page to group one or more zones and reference them in the global firewall group.

A zone set is a grouping of one or more zones in a network to regulate and secure traffic through the security platform running Junos OS. With the zone-based security, you can define multiple security zones, group similar interfaces, and apply the same policies to the zones to avoid creating multiple policies across every possible interface.

Zone sets are referenced in the global firewall group to provide you with the flexibility to perform actions on traffic without the restrictions of zone specifications.

Before You Begin

- Read the [“Understanding Zone Sets” on page 795](#) topic.
- Define a security zone.
- Add logical interfaces to the zone.
- Review the zone sets main page for an understanding of your current data set. See [“Zone Sets Main Page Fields” on page 804](#) for field descriptions.

Configuring Zone Sets Settings

To configure a zone set:

1. Select **Configure > Shared Objects > Zone Sets**.
2. Click the + icon.
3. Complete the configuration according to the guidelines provided in the [Table 273 on page 798](#).
4. Click **OK**.

A new zone set with the predefined configurations is created. You can use this zone set in firewall policy.

Table 273: Zone Set Settings

Settings	Guidelines
Name	Enter a unique name for the zone set that begins with alphanumeric characters. Colons, periods, slashes, dashes, and underscores are allowed. The maximum length is 63 characters.
Description	Enter a description for the zone set; maximum length is 1024 characters.
Zones	<p>Select one or more predefined or unique zones from the Available column for inclusion in the zone set. For example: DMZ, junos-host.</p> <p>The unique zones and predefined zones on your firewall depend on the device managed by Security Director.</p>

Editing and Cloning Policies and Objects

You can edit or clone policies and objects from the policies and shared objects main page.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Editing Policies or Objects

To edit a policy or a shared objects:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to edit, and then click the pencil icon.

The Edit window appears, showing the same options as when creating a new policy or object.

3. Click **OK** to save your changes.

Cloning Policies or Objects

To clone a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to clone, or select **Clone** from the More list.

The Clone window appears with editable fields.

3. Click **OK** to save your changes.

RELATED DOCUMENTATION

Deleting and Replacing Policies and Objects

You can delete or replace policies and objects from the policies and shared objects main page.

NOTE: Note: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Deleting Policies and Objects

To delete a policy or a shared object:

1. Select **Configure > Policies or Shared Objects**.

The policies or shared objects page appears.

2. Select the policy or shared object that you want to delete, and then select the minus sign (-).

An alert message appears verifying that you want to delete your selection

3. Click **Yes** to delete your selection.

Replacing Policies and Objects

You can select one or more shared objects and replace them with other objects of the same type.

To replace one or more object:

1. Select **Configure > Shared Objects > Addresses, Services, or Variables**.

The addresses, services, or variables page appears.

2. Right-click the shared object that you want to replace, or click **Replace** from the More list.

You can replace a single object or multiple objects. If the selected object is used in any policy, a warning message appears before they are replaced.

3. Click **Yes** to continue the replacement operation.

[Creating NAT Policies | 567](#)

Finding Usages for Policies and Objects

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

You can find usages for policies or objects and take appropriate action.

To find policies or objects usages:

1. Select **Configure** > and select the landing page for the policy or object for which you want to find usages.
The policies or shared objects page appears
2. Right-click the policy or object or click **More**.
3. Select **Find Usage**. The usage window appears, showing the usage of the selected policy or object.

RELATED DOCUMENTATION

[Showing and Deleting Unused Policies and Objects | 801](#)

[Editing and Cloning Policies and Objects | 799](#)

Showing and Deleting Unused Policies and Objects

You can show or delete unused policies and objects in your network configurations.

NOTE: Some tasks in this topic might not apply to your feature. Refer to the tasks relevant to you.

Showing Unused Policies and Objects

You can view all unwanted policies or objects that are not used anywhere in your network to take appropriate action.

To show unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are showing.
2. From the landing page, click **More**.

A list of actions appears.

3. Select **Show Unused**.

A list of unused objects (not referenced in any policy) and unused policies appear on the page.

Deleting Unused Policies and Objects

You can clear all unwanted policies or objects that are not used anywhere in your network.

To delete unused policies or objects:

1. Select **Configure** and select the landing page for type of policy or object you are deleting.
2. Select the check boxes beside the items that you want to delete. Right-click on the policy or object or click **More** from the landing page.

A list of actions appears.

3. Select **Delete Unused**.

A confirmation window appears before you can delete the unused policies or objects.

4. Click **Yes** to confirm the deletion.

All unused policies or objects are deleted.

RELATED DOCUMENTATION

Showing Duplicate Policies and Objects

To display duplicate objects:

1. Select the check box beside the object(s).
2. Right click and select **Show Duplicates**, or select **Show Duplicates** from the **More** list.

The **Show Duplicates** page appears.

3. Select the duplicate object, and perform any of the following steps:

- Select **Merge** from the **More** list to merge objects.
The merge operation deletes or replaces the reference for only the custom services and not the predefined services. If the selected duplicate objects are referenced in any other services (firewall policy, NAT pool or IPS policy) or the security objects (service groups), a warning message is provided before the objects are merged.
- Select **Find Usage** from the **More** list to locate the usage of the duplicate objects.
- Click the Delete icon (X) to delete the duplicate object(s).

Viewing Policy and Shared Object Details

On a policy or a shared object landing page, you can get a detailed view of the existing policies or objects. The Detail View page lists all the configured parameters of a policy or an object. The Landing page of a policy or shared object lists only some of the configured parameters and not all. The Detail View option helps you to get a consolidated view of all the configured parameters.

NOTE: The detailed view is in read-only mode; you cannot edit any fields.

To see a detailed view of the policy or a shared object:

1. Select **Configure >Policies** or **Shared Objects**.

The policies or shared objects page appears.

2. Right-click the policy or shared object that you want to see the detailed view for, or select **Detail View** from the More list.

The Detail View page appears showing the configuration information, the user who created that particular policy or shared object, and the last updated information.

You can also get a detailed view by hovering over the name and clicking the Detailed View icon before the policy or shared object name.

Shared Objects-Metadata

IN THIS CHAPTER

- [Metadata-Based Policy Enforcement Overview | 806](#)
- [About the Metadata Page | 807](#)
- [Creating a Metadata | 808](#)

Metadata-Based Policy Enforcement Overview

Traditionally, firewall policies are created using source and destination address objects. These objects are usually addresses or address groups. To create a firewall policy, you must know the IP address or range of IP addresses you want to target.

The introduction of metadata enables you to appropriately tag these addresses. You can use these metadata tags when you create the firewall policy.

The metadata-based policy enforcement involves the following steps:

1. Metadata definition—Define the metadata key values you want to use. For example, Location = Bangalore; Sunnyvale, OS = Windows, Mac, Linux; Role = Database, application, Web.
2. Metadata association—Associate the defined metadata with the addresses of type host or range.
3. Metadata expressions evaluation—When you create a rule for a firewall policy, you choose the source and destination addresses based on metadata expressions, instead of IP addresses, address groups, or network ranges.

Benefits of Metadata-Based Policies

- The use of metadata tags facilitates a wide range of security automation operations and significantly reduces the number of rules required to implement a solution.
- Metadata-based policies ensure that the defined security policy is instantiated on the firewalls even before the applications and application components are created. When the new application components are instantiated, the relevant firewall policies are automatically updated with the metadata for the application components, thereby enabling automatic policy enforcement at the time of instantiation of

- the application components. The security administrators do not need to manually commit changes related to the metadata of addresses unless the rules are changed.
- Whether you deploy the application components inside a data center or in different public cloud locations, you can leverage the same metadata-based policy and deploy it to different SRX Series devices or vSRX instances in different locations and achieve a consistent security posture.
 - Security administrators can see a more holistic picture about each network entity based on the metadata assignments. The administrators are no longer limited to knowing the network entity based on only the IP address of the entity.

- [About the Changes Not Submitted Page | 828](#)
- [Discarding Policy Changes | 829](#)
- [Viewing Submitted and Unsubmitted Policy Changes | 830](#)

Change Control Workflow Overview

IN THIS SECTION

- [Benefits of the Change Control Workflow | 812](#)
- [Setting Up the Change Control Workflow | 812](#)

The change control workflow allows you to request an approval for changes to a firewall or a NAT policy. Traditionally, when a policy is published and/or updated, all the changes to the policy are published. You cannot select a subset of changes to publish. For example, suppose two rules, R1 and R2, are added to a policy. When the policy is published, both the rules are published. R1 and R2 rule additions cannot be published separately.

The change control workflow represents a set of changes made to a policy to achieve a logical goal (usually a request in an IT ticketing system). For example, a new finance user in a company requests access to the server that hosts the payroll management system. The user files a ticket requesting access. At this point,

the requester creates a change request. The approver can either approve or deny the change request, individually or as part of a batch. The Change Management workspace allows the requester (in this case, the firewall administrator) to create and update change requests and the approver to approve or deny change requests.

[Table 277 on page 811](#) describes the roles for the change control workflow.

Table 277: Predefined Roles in the Change Control Workflow

Role	Description
Security Director Change Control Requester	<p>A user with access permission needed to make changes to designated policies; submit them for approval; and, once approved, update them to the network.</p> <p>For example, an administrator can provide the required information about the change to the firewall or NAT policy.</p>
Security Director Change Control Approver	<p>A user with access permission needed to approve change requests from a requester. For example, a senior administrator or manager can act as an approver, after which a firewall administrator, acting as the requester, can update the changes to the appropriate firewall or NAT policy.</p>

At a high level, the following change control workflow tasks, and who performs them, are described:

1. The administrator opens a new session to modify the security or network environment, or both, by using Security Director.
2. The administrator configures the security policy and application settings in Security Director.
3. The administrator submits the completed session for approval.
4. The manager reviews the proposed modifications and either approves or denies the request, or returns it to the administrator with a request to make the proposed changes.
5. The administrator makes the requested changes and resubmits the session for approval, if the manager initially denied the request and requested modifications.
6. The manager approves the request.
7. The administrator installs the policy for all approved sessions.

NOTE:

- Before you can install a policy, all sessions must be approved,
- If a user publishes a policy, all change requests created for that policy are deleted and all current changes on the policy are pushed to the device.

The following sections provide more information about the change control workflow:

Benefits of the Change Control Workflow

- The request resembles a request in an IT ticketing system. The approver can either approve changes to a firewall or NAT policy or deny the change request, individually or as part of batch.
- The policies that are modified within an activity (or configuration session) are locked and thereby prevented from being modified within other activities. This prevents conflicting changes from being made.

Setting Up the Change Control Workflow

To set up the change control workflow:

1. Select **Network Management Platform > Administration > Applications**.
A page appears listing the available Network Management Platform applications.
2. Right-click **Security Director** and select **Modify Application Settings**.
3. Click **Change-Control-Workflow** and provide the information, as described in [Table 278 on page 812](#).

Table 278: Fields on the Change Control Workflow Setting Page

Option	Description
Enable Change Control Workflow	Approve all firewall and NAT policy changes before updating the policy changes. All Security Director users will be logged out after this option is selected.
Default approval days	Number of days within which the request must be approved or denied. The default number of days is 7.
Default ticket field name	Ticket field name for creating the change request. The default field name is Ticket Number.

Table 278: Fields on the Change Control Workflow Setting Page (*continued*)

Option	Description
Enable e-mail notifications	Receive e-mail notifications when the change request is created, approved, or denied. The notification is sent to both the requester and the approver.
Maximum requests per policy	Maximum number of outstanding change requests per policy. The default value is 10.

NOTE: If you disable the change control workflow, all the change requests created for firewall and NAT policies are deleted.

RELATED DOCUMENTATION

Creating a Firewall or NAT Policy Change Request

Use the Create Change Request page to create change requests for a firewall or NAT policy.

To create a change request:

1. Select **Configure** > **<Policy-Name>** > **Policies**.

The Policies page appears.

2. Select the policy that you want to request a change, and click **Request Change**.

The Create Change Request page appears.

3. Complete the configuration by using the guidelines in [Table 279 on page 814](#).
4. Click **OK** to complete the configuration or **Cancel** to discard the configuration.

Table 279: Fields on the Create Change Request Page

Field	Description
Request Name	Enter a unique string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed; maximum length is 63 characters.
Description	Enter a description for the change request; maximum length is 255 characters.
Ticket Number	<p>Enter the ticket number of the change request; maximum length is 255 characters.</p> <p>This is an identifier to a ticket in the customer's ticketing system. This helps in correlating the change request to an item in the customer's ticketing system. More than one change request can be mapped to a ticket. Because a change request is for a single policy, a ticket could involve changes to multiple policies.</p> <p>Different customers use different terminologies to represent the ticketing system. Therefore, the name of this field is configurable. For example, you can name this field as ticket number, work-flow, tracking ID, or any other name.</p>
Request Priority	<p>Select the priority from the list for your change request. The change requests are processed according to the priority.</p> <p>The available options are:</p> <ul style="list-style-type: none"> • Low • Medium • High • Critical <p>This field indicates the criticality of the change request and helps the approver to prioritize the review of their outstanding tickets. Apart from prioritizing the reviews, this does not affect the change request workflow in any other way.</p>
Approval Due Date	<p>Select a due date for approval.</p> <p>If you do not select a date, a default duration of 5 days from the current date is set as a due date for approval.</p>
Changes	Click View to view the unsubmitted changes of a policy.

About the Changes Submitted Page

To access this page, click [Configure > Change Management > Change Requests](#).

Use the Changes Submitted page to take appropriate actions on the changes submitted such as approve, deny, update, edit, and delete.

Tasks You Can Perform

You can perform the following tasks from this page:

- Approve the request. See [“Approving and Updating Changes Submitted” on page 817](#).
- update the approved changes. [“Approving and Updating Changes Submitted” on page 817](#).
- Deny the request. See [“Editing, Denying, and Deleting Change Requests” on page 826](#).
- Edit or delete the change request. See [“Editing, Denying, and Deleting Change Requests” on page 826](#).

Field Descriptions

[Table 280 on page 816](#) provides guidelines on using the fields on the Changes Submitted page.

Table 280: Fields on the Changes Submitted Page

Field	Description
Request Name	<p>Name of the change submit request.</p> <p>Click the request name to view the following information:</p> <ul style="list-style-type: none"> • Summary of changes • Delta of changes • Compare the changes between change requests • List of affected devices
Status	Specifies the status of the change request such as, pending, approved, denied, updated, in progress, and update failed.
Priority	Specifies the priority of the change request and helps approvers prioritize reviews of their outstanding tickets.
Dependencies	Specifies if the policy has any dependencies with other policies. If a change request depends on other change requests, this column contains a link to view the dependencies. For example, a rule is added in CR1. The same rule is then modified in a subsequent change request, CR2. CR2 is now dependent on CR1 (CR1 is a dependency of CR2).
Approval Due Date	Specifies the date by which the requestor is asking the approver to complete the review of the change request.
Policy Name	Specifies the name of the policy for which the change request has been created.
Service Type	Specifies the service type of the policy. For example: Firewall, NAT
Ticket Number	Specifies the ticket number. This information helps in correlating the change request to an item in the customer's ticketing system. Note that more than one change request could map to a ticket and could involve changes to multiple policies.
Description	Specifies the description of the change request. This field is autopopulated from the comments the user enters while saving changes to the policy. If user performs multiple saves, this field is populated with a concatenated list of all saved comments.
Created By	Specifies the name of the requester.

[About the Change Request History Page | 832](#)

Approving and Updating Changes Submitted

To approve the change requests and update the policy changes:

1. Select **Configure > Change Management > Change Requests**.

The Changes Submitted page appears.

2. Select the change request and click **Approve**.
 3. The submitted change request is displayed in the approvers workspace.
 4. The approver reviews the change request and checks for any dependencies. Dependencies can be viewed by clicking the View link.
 5. If there are no dependencies, the approver enters the comments in the Approve Request window and then clicks **Yes**. A pop-up message shows the status as approval successful.
 6. The change request workspace of the firewall administrator shows all the change requests that were approved or rejected.
 7. The administrator then selects an approved change request and schedules it to publish and update.
 8. The administrator selects **Update** to update immediately or schedule to update later. If the selected change request has dependencies, then the user is notified that update of dependency change requests will also be scheduled (if they have not been already) or advanced (if they have been scheduled for a later time) to the same time as that of the selected change request. The list of dependency change requests that are also updated will be displayed. A new snapshot of the policy is created. This snapshot is used as the source for publish and update. This new snapshot is essentially the previously updated snapshot of the policy along with the changes from the selected change request. This snapshot is visible in the Manage Snapshots list.
- Updating a change request is same as publishing and updating together. If either of publish or update jobs fail, the change request is moved to the Update Failed state. You can reupdate the failed change requests.

9. The administrator views and verifies the job status.

NOTE:

- You must approve all the parent change requests before approving a child change request, if there is a dependency.
- You must deny all child change requests before denying a parent change request, if there is a dependency.

Creating and Updating a Firewall Policy Using Change Control Workflow

IN THIS SECTION

- [Creating a Change Request | 818](#)
- [Approving a Change Request | 821](#)
- [Publishing and Updating the Approved Change Request | 824](#)

To create, approve, and update a firewall policy using the Change Control Workflow, perform these tasks:

Creating a Change Request

The following procedure explains the steps policy administrators need to take to submit change requests.

To create a change request:

1. Configure the Change Control Workflow:

- a. Select **Network Management Platform > Administration > Applications**.

The Applications page appears.

- b. Right-click **Security Director** and click **Modify Application Settings**.

The Modify Security Director Settings page appears.

- c. Click **Change-Control-Workflow**.

The Change Control Workflow page appears in the right pane, as shown in [Figure 67 on page 819](#).

Figure 67: Change Control Workflow Configuration

Administration > Applications > Modify Application Settings

Modify Security Director Settings

Change-Control-Workflow

Change-Control-Workflow

- ☒ Enable Change Control Workflow
- Default approval days: [default]
- Default ticket field name:
- ☒ Enable email notifications when a change request is created, approved or denied
- Maximum number of requests per policy: [default]

Modify **Cancel**

- d. Select the Enable Change Control Workflow option to enable the Change Control Workflow for all the firewall and NAT policies.

By default, the Change Control Workflow option is disabled. When you enable this option, you are logged out of Security Director.

- e. In the Default approval days field, enter the default number of days for reviewers to approve or deny the change request. The default value is five days.

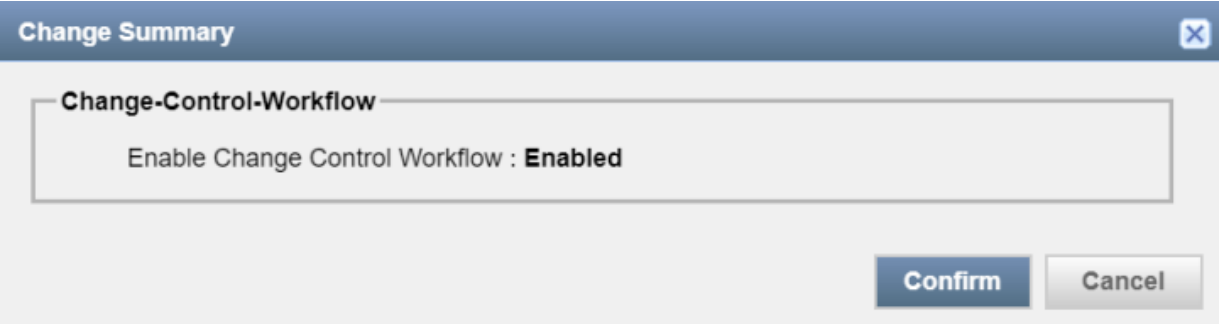

- f. In the Default ticket field name field, enter the ticket name.

The ticket name that you enter here appears on the Create Change Request page as a separate field where you can enter the ticket number. The default name is Ticket Number.

- g. Enable the e-mail notification option for approvers and requesters when a change request is created, approved, or denied. By default, this option is disabled.
- h. In the Maximum number of requests per policy field, enter the maximum number of outstanding change requests that can exist in an undeployed state for a policy. The default value is 10 requests.
- i. Click **Modify**.

A confirmation page appears to enable the Change Control Workflow, as shown in [Figure 68 on page 820](#).

Figure 68: Confirm Change Control Workflow

- j. Click **Confirm**.
- 2. Request approval for a change request.
 - a. In the Firewall Policies page, select the policy, and click **Request Change**.

The Create Change Request page appears, as shown in [Figure 69 on page 820](#). You can also edit a policy rule and create a change request from the Policy Rules page.

Figure 69: Create Change Request Page

A screenshot of a web form titled "Create Change Request" with a help icon (question mark in a circle). The form contains several input fields and a dropdown menu. The fields are: "Request Name *" with the value "ccr-1", "Description" with the value "rule change request", "Ticket Number" with the value "101", "Request Priority *" with a dropdown menu showing "MEDIUM", and "Approval Due Date" with the value "09/10/2017" and a calendar icon. Below these fields is a "Changes" section with a "View" link. At the bottom right of the form, there are "Cancel" and "OK" buttons.

- b. In the Request Name field, enter the name of your change request. You can enter a maximum of 63 characters.
- c. In the Description field, enter the description for your change request. You can use a maximum of 255 characters.

- d. In the Ticket Number field, enter the ticket number for your change request. The maximum length is 255 characters.

This number is an identifier to a ticket in your ticketing system. You can map more than one change request to a ticket.

- e. From the Request Priority list, select the priority for your change request to let the approver know the criticality of your change request.

The default priority is High.

- f. In the Approval Due Date field, select a due date for approval.

By default, the number of days that you configured in Step 1 are set for approval.

- g. In the Changes field, click **View** to view the unsubmitted changes before creating a change request.

- h. Click **Ok**.

A change request for your policy is created for approval. Any changes to the shared objects or rules of the policy are also submitted for change request approval. This change request appears in the workspace of the approver to take appropriate action.

Approving a Change Request

The following steps explain the procedure for approvers to take necessary action on the submitted change requests:

1. Review the submitted change requests by the policy administrators.
 - a. Click **Security Director > Configure > Change Management > Change Requests**.

Approver can see the changes submitted information, as shown in [Figure 70 on page 822](#).

- b. Under the Changes Submitted section, review the change request in the pending state and check for any dependencies. In the Dependencies column, click **View** to view dependencies.
2. Approve or deny the change request.

a. After reviewing the change request, click **Approve** or **Deny**.

A confirmation window appears to approve or deny the change request. A comment in the confirmation window for the Deny action is mandatory, as shown in [Figure 71 on page 823](#) and [Figure 72 on page 823](#).

NOTE:

- Ensure that the change request does not have any dependencies before the approval. If there is a dependency, you must approve all the parent change requests before approving a child change request.
- Before denying a change request, you must ensure that all the change requests that are dependent on the selected change request for denial are already in the denied state. A warning message is displayed if the dependent change requests are not in the denied state.

- b. Click **Yes** to approve or deny the request.

The change request workspace of the policy administrator shows all the change requests that were approved or rejected. An e-mail is sent to the requester and other approvers about the approval or denial of the corresponding change request.

Publishing and Updating the Approved Change Request

The change request workspace of the policy administrator shows the change requests that are approved or rejected. The policy administrators can update only the approved change requests. Updating a change request is the same as publishing and updating in succession. You can either update the change request immediately or schedule to update later.

To update a change request:

1. Click **Security Director > Configure > Change Management > Change Requests**.

You see the information on changes submitted.

2. In the Changes Submitted area, select the approved change request and click **Update**.

The Update Change Request page appears, as shown in [Figure 73 on page 825](#).

Figure 73: Update Change Request Page

Update Change Request ?

Update * ?

☐ Run now
☒ Schedule at a later time

09/05/2017 11:25:18 AM

Cancel Update Request

3. Select the **Run now** option to update the changes immediately or the **Schedule at a later time** option to schedule the update later.

If the selected change request has dependencies, then the user is notified that the deployment of dependency change requests will also be scheduled (if they have not been already) or advanced (if they have been scheduled for a later time) to the same time as that of the selected change request.

A new snapshot of the policy is created. This snapshot is used as the source to publish and update. This new snapshot is essentially the previously deployed snapshot of the policy along with the changes from the selected change request. This snapshot is visible in the Manage Snapshots list.

4. Click **Update Request**.

If either the publish job or update job fails, then the change request is moved to the Deployment Failed state. You can redeploy the failed change requests.

5. Review and verify the publish and update job status.

The review, verification, and update is performed by the policy administrators.

RELATED DOCUMENTATION

Editing, Denying, and Deleting Change Requests

IN THIS SECTION

- [Editing Changes Submitted | 826](#)
- [Denying Changes Submitted | 826](#)
- [Deleting Changes Submitted | 827](#)

You can edit, deny, and delete the change requests from the Changes Submitted page. You can deny the approved change request to remove the changes.

Editing Changes Submitted

To edit a change request:

1. Select **Configure > Change Management > Change Requests**.

The Changes Submitted page appears.

2. Select the submitted change request that you want to edit, and click the pencil icon.

The Edit Change Request page appears, showing the same fields that are displayed when you create a new change request.

3. Edit the change request fields as needed.

4. Click **OK** to save changes.

The changes are saved and you are returned to the Changes Submitted page.

Denying Changes Submitted

To deny a change request:

1. Select **Configure > Change Management > Change Requests**.

The Changes Submitted page appears.

2. Select a changed request that you want to deny, and click **Deny**.

The Deny Request page appears to confirm the deny action. You can select multiple change requests for denial.

3. Enter your comment for the denial.

This is a mandatory field. You must ensure that all the change requests that are dependent on the selected change request for denial are already in the denied state. A warning message is displayed, if the dependent change requests are not in the denied state.

4. Click **Yes** to deny the request.

A confirm message shows the denial as successful and the status is changed from Approved to Denied, on the Changes Submitted landing page. An e-mail is sent to the requester of the change request and other approvers about the denial of the change request.

Deleting Changes Submitted

To delete a change request:

1. Select **Configure > Change Management > Change Requests**.

The Changes Submitted page appears.

2. Select the change request that you want to delete and click the **X** icon.

A warning dialog box appears asking you to confirm the deletion.

3. Click **Yes** to delete the selected change request.

The change request is deleted and you are returned to the Changes Submitted page.

NOTE: You cannot select more than one change request for deletion.

[Approving and Updating Changes Submitted | 817](#)

About the Changes Not Submitted Page

To access this page, click Configuration > Change Management > Change Requests.

Use the Changes Not Submitted page to view all policy changes that are not submitted. You can also perform the required actions such as initiating the change request, editing the policy, and discarding the policy changes.

A policy can be submitted for change request, if one or more of the following conditions match:

- If the policy is explicitly locked and being modified by the current user.
- If the policy is implicitly modified because of a change in a referred shared object (except if the policy is locked by another user).

NOTE: Changes to a shared object can be made by any user with the appropriate permissions.

- The policy is newly created, imported, or migrated from NSM.

A policy cannot be submitted for change request for the following reasons:

- If a policy is not assigned to any device.
- If a policy is locked by some other user.

Tasks You Can Perform

You can perform the following tasks from this page:

- Initiate the change request. See [“Creating a Firewall or NAT Policy Change Request” on page 813](#).
- Edit the policy details.
- Discard the policy changes. See [“Discarding Policy Changes” on page 829](#).

Field Descriptions

[Table 281 on page 828](#) provides guidelines on using the fields on the Changes Not Submitted page.

Table 281: Fields on the Changes Not Submitted Page

Field	Description
Policy Name	Specifies the name of the policy. Click the Policy Name link to view the summary of changes to the policy.

Table 281: Fields on the Changes Not Submitted Page (*continued*)

Field	Description
Unsubmitted Changes	Click View to view detailed information about the unsubmitted changes.
Service Type	Specifies the type of policy (firewall or NAT).
Last Modified	Specifies date and time at which the policy was modified.
Change Saved By	Specifies the name of the user who saved the changes.

RELATED DOCUMENTATION

[Viewing Submitted and Unsubmitted Policy Changes | 830](#)

Discarding Policy Changes

At any time, you can undo all changes made during the current session. This action removes the changes and the policy reverts to its previous state.

To discard all the changes made during the current session:

1. Select **Configuration > Change Management > Change Request**.
2. In the Changes Not Submitted section, select the unsubmitted policy, and click **Discard Policy Changes**.

A warning dialog box appears asking you to confirm the discard operation.

3. Click **Yes**.

This operation also includes discarding changes to the referred shared objects. The Object Conflict Resolution (OCR) is performed to check for any conflicts while rolling back the changes. If there are any conflicts between the versioned data and the current changes in the system, the OCR window is displayed. After resolving all conflicts, click **Next** to view the OCR summary report.

4. Click **Finish** to discard the changes.

Overview of Policy Enforcer and Sky ATP

IN THIS CHAPTER

- [Juniper Networks Software-Defined Secure Network Overview | 834](#)
- [Policy Enforcer Overview | 836](#)
- [Benefits of Policy Enforcer | 838](#)
- [Sky ATP Overview | 841](#)

Juniper Networks Software-Defined Secure Network Overview

The Juniper Networks Software-Defined Secure Network (SDSN) provides end-to-end network visibility, allowing enterprises to secure their entire network, both physical and virtual. Using threat detection and policy enforcement, an SDSN solution automates and centrally manages security in a multi-vendor environment.

The Juniper Networks SDSN solution is comprised of the following components:

- A threat detection engine—Cloud-based Sky ATP detects known and unknown malware. Known threats are detected using feed information from a variety of sources, including command control server and GeolP. Unknown threats are identified using various methods such as sandboxing, machine learning, and threat deception.
- Centralized policy management—Junos Space Security Director, which also manages SRX Series devices, provides the management interface for the SDSN solution called Policy Enforcer. Policy Enforcer communicates with Juniper Networks devices and third-party devices across the network, globally enforcing security policies and consolidating threat intelligence from different sources. With monitoring capabilities, it can also act as a sensor, providing visibility for intra- and inter-network communications.
- Expansive policy enforcement—In a multi-vendor enterprise, SDSN enforces security across Juniper Networks devices, cloud-based solutions, and third-party devices. By communicating with all enforcement points, SDSN can quickly block or quarantine threat, preventing the spread of bi-lateral attacks within the network.
- User intent-based policies—Create policies according to logical business structures such as users, user groups, geographical locations, sites, tenants, applications, or threat risks. This allows network devices

(switches, routers, firewalls and other security devices) to share information, resources, and when threats are detected, remediation actions within the network.

With user intent-based policies, you manage clients based on business objectives or user and group profiles. The following are two examples of a user intent policy:

- Quarantine users in HR in Sunnyvale when they're infected with malware that has a threat score greater than 7.
- Block any user in Marketing when they contact a Command and Control (C&C) server that has a threat score greater than 6 and then send an e-mail to an IT administrator.

Using user intent-based policies allows network devices (switches, routers, firewalls and other security devices) to share information, resources, and when threats are detected, remediation actions within the network.

Unlike rule-based policies, which can contain several rules, you can define only one set of parameters for each user intent-based policy defined on a device.

Benefits of Juniper Networks Software-Defined Secure Network

- **Management and visibility** - Enables you to view traffic across the network, dynamically deploy security policies and block threats. SDSDN manages the entire network infrastructure as a single enforcement domain, thereby providing enforcement points across the network. Uses machine learning and data mining tools to offer effective threat management while producing detailed data access and user activity reports.
- **Comprehensive security** - Ensures that the same security policies are applied across all of the devices in the network. It extends security to each layer of the network, including routers, switches, and firewalls.
- **Protection from advanced malware** - Provides automated offense identification and consolidates the threat intelligence with threat hunting activities to simplify and focus attention on the highest priority offenses.
- **Automated policy or enforcement orchestration** - Provides real-time feedback between the security firewalls. Reduces the risk of compromise and human error by allowing you to focus on maximizing security and accelerating operations with a simple, concise rule set.
- **Scalability** - Supports up to 15,000 devices.
- **Third-party integration** - Provides APIs to integrate with the ecosystem partners for capabilities such as cloud access security, network access control, and endpoint protection, and additional threat intelligence feeds.

RELATED DOCUMENTATION

[Policy Enforcer Overview | 836](#)

[Policy Enforcer Components and Dependencies | 844](#)

Policy Enforcer Overview

Policy Enforcer, a component of the Junos Space Security Director user interface, integrates with Sky ATP to provide centralized threat management and monitoring to your software-defined secure network, giving you the ability to combine threat intelligence from different solutions and act on that intelligence from one management point.

It also automates the enforcement of security policies across the network and quarantines infected endpoints to prevent threats across firewalls and switches. Working with Sky ATP, it protects perimeter-oriented threats as well as threats within the network. For example, if a user downloads a file from the Internet and that file passes through an SRX Series firewall, the file can be sent to the Sky ATP cloud for malware inspection. If the file is determined to be malware, Policy Enforcer identifies the IP address and MAC address of the host that downloaded the file. Based on a user-defined policy, that host can be put into a quarantine VLAN or blocked from accessing the Internet.

[Figure 74 on page 837](#) illustrates the flow diagram of Policy Enforcer over a traditional SRX Series configuration.

Figure 74: Comparing Traditional SRX Customers to Policy Enforcer Customers

Supported Topologies

Policy Enforcer supports the following topologies:

- Client to Layer 2 switch to Layer 3 SRX (IRB)
- Client to Layer 2 switch to Layer 3 switch (IRB)
- Client to Layer 2/Layer 3 switch (IRB)

Role-Based Access Control for Threat Management

The Policy Enforcer must have the following predefined roles or privileges to perform the threat management. Users without these privileges will not see any pages related Policy Enforcer and Sky ATP in Security Director UI.

Threat Management has the following task groups and tasks:

- Threat Management Policy
 - Create Threat Management Policy
 - Modify Threat Management Policy
 - Delete Threat Management Policy
- Dynamic Address Group
 - Create Dynamic Address
 - Modify Dynamic Address
 - Delete Dynamic Address

To create and view the user roles, select **Network Management Platform > Role Based Access Control > User Account**.

Benefits of Policy Enforcer

Most enterprise computer security revolves around creating a wall around the perimeter of an organization. See [Figure 75 on page 839](#).

Figure 75: Perimeter-Defined Security Model

With this perimeter oriented security, networks are built with an inherently trusted model where the applications or users connecting to a network (for example, VLAN) can fundamentally talk to each other and network security solutions like firewalls and Intrusion Prevention Systems (IPS) are deployed in the perimeter to provide security. Firewalls are often configured with all possible rules in an effort to prevent unknown malware, application and network attacks from penetrating the enterprise. This architecture is based on a model where it is assumed that “Everything already inside the network is fundamentally trusted” and “Everything outside the network is untrusted” so the perimeter is the location where all security controls are deployed.

This architecture is consistent across data centers, and campus and branch configurations. Unfortunately, there are flaws to this security architecture. They don’t help in protecting against internal threats. Despite the popularity of firewalls, the sophistication of applications and malware in recent years has found a way to circumvent perimeter defenses. Once inside the enterprise, these threats can easily spread; where someone’s infected laptop or desktop could make Enterprise networks a botnet army and become a source of internal and external attacks. Enterprises can protect against internal threats by deploying multiple layers of firewalls, but that requires careful planning since it is difficult to take all internal traffic through a separate layer of firewalls.

The security framework become a highly fragmented approach due to multiple administrators, management systems and reliance on a lot of manual coordination among different administrators and systems:

- There is a network security team that manages security policies on perimeter firewalls primarily to manage external threats.
- There is a network operations team, that typically manages security policies by using network and application isolation to protect against internal attacks and unauthorized access.
- Then there is third team, an IT team, that manages end-points such as laptops, desktops and application servers to make sure that they have the correct security posture.

In contrast, Policy Enforcer and Software-Defined Secure Networks (SDSN), see [Figure 76 on page 840](#), simplifies network security by providing protection based on logical policies and not security devices. Policy Enforcer does provide perimeter security, but it's no longer just protecting the inside from the outside. The fact that somebody is connected to the internal network does not mean that they can get unrestricted access to the network. This model is fundamentally more secure because even if one application on the network is compromised, companies can limit the spread of that infection/threat to other potentially more critical assets inside the network.

Figure 76: Policy Enforcer and Software-Defined Security Model

Policy Enforcer is a model where the information security is controlled and managed by security software. New devices are automatically covered by security policies, instead of having to identify its IP address as with other models. Because it's software-defined, environments can be moved without affecting security policies and controls already in place. Other advantages include:

- **Better and more detailed security**—By providing better visibility into network activity, you can respond faster to cyber threats and other security incidents. Threats can be detected faster by leveraging threat intelligence from multiple sources (including third-party feeds) and the cloud. A central control lets you analyze security challenges without interfering with standard network activity and to distribute security policies throughout your organization. For example, you can selectively block malicious traffic while allowing normal traffic flow.
- **Scalability and cost savings**—A software-based model allows you to quickly and easily scale security up or down based on your immediate needs all without having to add or subtract hardware that is expensive to buy and maintain.
- **Simpler solution**—Hardware security architectures can be complex due to the servers and specialized physical devices that are required. In a software model, security is based on policies. Information can be protected anywhere it resides without depending on its physical location.

Sky ATP Overview

Sky ATP is a cloud-based solution that integrates with Policy Enforcer. Cloud environments are flexible and scalable, and a shared environment ensures that everyone benefits from new threat intelligence in near real-time. Your sensitive data is secured even though it is in a cloud shared environment. Security administrators can update their defenses when new attack techniques are discovered and distribute the threat intelligence with very little delay.

Sky ATP offers the following features:

- Communicates with firewalls and switches to simplify threat prevention policy deployment and enhance the anti-threat capabilities across the network.
- Delivers protection against “zero-day” threats using a combination of tools to provide robust coverage against sophisticated, evasive threats.
- Checks inbound and outbound traffic with policy enhancements that allow users to stop malware, quarantine infected systems, prevent data exfiltration, and disrupt lateral movement.
- Provides deep inspection, actionable reporting, and inline malware blocking.
- Provides feeds for GeoIP, C&C, whitelist and blacklist, infection hosts, custom configured feeds and file submission.

[Figure 77 on page 842](#) lists the Sky ATP components.

Figure 77: Sky ATP Components

Table 284 on page 842 briefly describes each Sky ATP component's operation.

Table 284: Sky ATP Components

Component	Operation
Command and control (C&C) cloud feeds	C&C feeds are essentially a list of servers that are known command and control for botnets. The list also includes servers that are known sources for malware downloads. See "Command and Control Servers Overview" on page 90.
GeoIP cloud feeds	GeoIP feeds is an up-to-date mapping of IP addresses to geographical regions. This gives you the ability to filter traffic to and from specific geographies in the world.
Infected host cloud feeds	Infected hosts indicate local devices that are potentially compromised because they appear to be part of a C&C network or other exhibit other symptoms. See "Infected Hosts Overview" on page 87.
Custom Feeds	Lists you customize by adding IP addresses, domains, and URLs to your own lists. See "Custom Feed Sources Overview" on page 697.
Whitelists and blacklists	A whitelist is simply a list of known IP addresses that you trust and a blacklist is a list that you do not trust. See "Creating Whitelists and Blacklists" on page 727.

Table 284: Sky ATP Components *(continued)*

Component	Operation
Malware inspection pipeline	Performs malware analysis and threat detection.
Internal compromise detection	Inspects files, metadata, and other information.

Policy Enforcer Components and Dependencies

The Policy Enforcer management interface is a component of Junos Space Security Director and requires the following to be configured and deployed:

- **Junos Space Virtual Appliance**—Junos Space is a comprehensive network management solution that simplifies and automates management of Juniper Networks switching, routing, and security devices. Junos Space Virtual Appliance includes the complete Junos Space software package as well as the Junos OS operating system. It requires users to create a virtual machine (VM) in order to deploy the appliance.
- **Security Director**—Junos Space Security Director provides centralized and orchestrated security policy management through a web-based interface. Security administrators can use Security Director to manage all phases of the security policy life cycle for every SRX Series physical and virtual device.
- **Policy Enforcer**—Policy Enforcer itself is installed on a VM and uses RESTful APIs to communicate with both Security Director and Sky Advanced Threat Prevention (ATP). Policy Enforcer contains two components:
 - **Policy Controller**—Defines the logical grouping of the network into secure fabric, automates the enrollment of SRX Series devices with Sky ATP, and configures the SRX firewall policies.
 - **Feed Connector**—Aggregates the cloud and customer feeds and is the server for SRX Series devices to download feeds.

- Sky ATP—Sky ATP employs a pipeline of technologies in the cloud to identify varying levels of risk, and provides a higher degree of accuracy in threat protection. It integrates with SRX Series gateways to deliver deep inspection, inline malware blocking, and actionable reporting.

Sky ATP's identification technology uses a variety of techniques to quickly identify a threat and prevent an impending attack, including:

- Rapid cache lookups to identify known files.
 - Dynamic analysis that involves unique deception techniques applied in a sandbox to trick malware into activating and self-identifying.
 - Machine-learning algorithms to adapt to and identify new malware.
- SRX Series device—SRX Series gateways provide security enforcement and deep inspection across all network layers and applications. Users can be permitted or prohibited from accessing specific business applications and Web applications, regardless of the network ports and protocols that are used to transmit the applications.

Figure 78 on page 845 illustrates how the components in the Policy Enforcer Deployment Model interact.

Figure 78: Components of the Policy Enforcer Deployment Model

Figure 79 on page 846 shows an example infected endpoint scenario to illustrate how some of the components work together.

Figure 79: Blocking an Infected Endpoint

Step	Action
1	A user downloads a file from the Internet.
2	Based on user-defined policies, the file is sent to the Sky ATP cloud for malware inspection.
3	The inspection determines this file is malware and informs Policy Enforcer of the results.
4	The enforcement policy is automatically deployed to the SRX Series device and switches.
5	The infected endpoint is quarantined.

Policy Enforcer can track the infected endpoint and automatically quarantine it or block it from accessing the Internet if the user moves from one campus location to another. See Figure 80 on page 847.

Figure 80: Tracking Infected Endpoint Movement

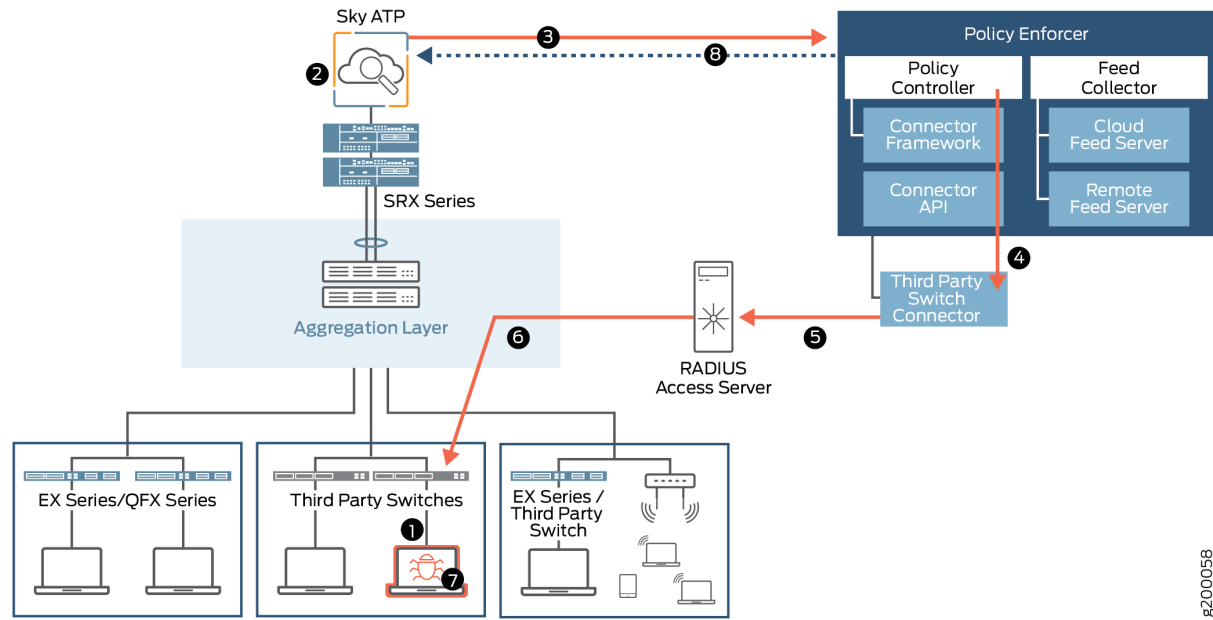

In this example, Sky ATP identifies the endpoint as having an IP address of 192.168.10.1 and resides in SVL-A. The EX Series switch quarantines it because it has been labeled as an infected host by Sky ATP. Suppose the infected host physically moves from location SVL-A to location SVL-B. The EX Series switch (in SVL-B) microservice tracks the MAC address to the new IP address and automatically quarantines it. Policy Enforcer then informs Sky ATP of the new MAC address-to-IP address binding.

Policy Enforcer can also quarantine infected hosts even if those hosts are connected to third-party switches, as shown in [Figure 81 on page 848](#).

For Policy Enforcer to provide threat remediation to endpoints connecting through third-party devices, it must be able to authenticate those devices and determine their state. It does this using a tracking and accounting threat remediation plug-in to gather information from a RADIUS server and enforce policies such as terminate session and quarantine. For more information, see [“Policy Enforcer Connector Overview” on page 887](#)

Figure 81: Third-Party Switch Support

8200058

Step	Action
1	An end-user authenticates to the network through IEEE 802.1X or through MAC-based authentication.
2	Sky ATP detects the end point is infected with malware and adds it to the infected host feed.
3	Policy Enforcer downloads the infected host feed.
4	Policy Enforcer enforces the infected host policy using the Connector. See “Policy Enforcer Connector Overview” on page 887 .
5	The Connector queries the RADIUS server for the infected host endpoint details and initiates a Change of Authorization (CoA) for the infected host.
6	The CoA can be either block or quarantine the infected host.
7	The enforcement occurs on the NAC device the infected host is authenticated with.
8	Policy Enforcer communicates the infected host details back to Sky ATP.

Policy Enforcer Configuration Concepts

You have some options for how you can approach the initial setup of Sky ATP and Policy Enforcer. There is a “Guided Setup” approach which walks you through the necessary steps for getting the product up and running. This is the recommended approach. If you prefer, you can manually configure each part of the product.

Either way, before you begin the configuration, you need to understand the concepts behind the configuration items required to successfully deploy threat management policies across your network. These items include security realms for Sky ATP, secure fabric for sites, and policy groups for endpoints. These are explained in this section.

- **Security Realm**—When configuring Sky ATP or Policy Enforcer with Sky ATP, there are Realm selection fields at the top of several pages. A security realm is a group identifier for an organization used to restrict access to Web applications. You must create at least one security realm to login into Sky ATP. Once you create a realm, you can enroll SRX Series devices into the realm. You can also give more users (administrators) permission to access the realm.

If you have multiple security realms, note that each SRX Series device can only be bound to one realm, and users cannot travel between realms.

- **Policy Enforcement Groups**—A policy enforcement group is a grouping of endpoints to which threat prevention policies are applied. Create a policy enforcement group by adding endpoints (firewalls, switches, subnets, set of end users) under one common group name and later applying a threat prevention policy to that group.

Some information to know about enforcement groups is as follows: Determine what endpoints you will add to the group based on how you will configure threat prevention, either according to location, users and applications, or threat risk. Endpoints cannot belong to multiple policy enforcement groups.

- **Threat Prevention Policies**—Once you have a Threat Prevention Policy, you assign one or more Policy Enforcement Groups to it. Threat prevention policies provide protection and monitoring for selected threat profiles, including command & control servers, GeoIP, infected hosts, and malware. Using feeds from Sky ATP and custom feeds you configure, ingress and egress traffic is monitored for suspicious

content and behavior. Based on a threat score, detected threats are evaluated and action may be taken once a verdict is reached.

- **Secure Fabric**—For your configuration you must create one or more sites for your secure fabric. Secure fabric is a collection of sites which contain network devices (switches, routers, firewalls, and other security devices), used in policy enforcement groups. When threat prevention policies are applied to policy enforcement groups, the system automatically discovers to which sites those groups belong. This is how threat prevention is aggregated across your secure fabric.

Some information to know about sites is as follows: When you create a site, you must identify the perimeter firewalls so you can enroll them with Sky ATP. If you want to enforce an infected host policy within the network, you must assign a switch to the site. Devices cannot belong to multiple sites.

Sky ATP Configuration Type Overview

Sky ATP with Policy Enforcer can be used in four different configuration types, which will be explained here.

NOTE: The license you purchase determines if you can use the available configurations and feature sets for your selected Sky ATP Configuration Type.

Configuration Type is set here in the UI: **Administration > Policy Enforcer > Settings**.

The following Sky ATP Configuration Types and corresponding workflows are available. Workflows are the items you configure for each selection.

Sky ATP with SDSN—This is the full version of the product. All Policy Enforcer features and threat prevention types are available.

Here is the Sky ATP with SDSN workflow:

- Secure Fabric
- Policy Enforcement Group
- Sky ATP Realm
- Threat Prevention Policies for the following threat types:
 - C&C Server
 - Infected Hosts
 - Malware
 - Geo IP

Sky ATP—This includes all threat prevention types, but does not include the benefits of Secure Fabric, Policy Enforcement Groups, and Threat Prevention policies provided by Policy Enforcer. All enforcement is done through SRX Series Device policies.

Here is the Sky ATP workflow:

- Sky ATP Realm
- Threat Prevention Policies for the following threat types:
 - C&C Server
 - Infected Hosts
 - Malware
 - Geo IP

Cloud feeds only—The prevention types available are command and control server, infections hosts, and Geo IP feeds. Policy Enforcer Secure Fabric, Policy Enforcement Groups, and Threat Prevention policies are also available. All enforcement is done through SRX Series Device policies.

Here is the Cloud feeds only workflow:

- Secure Fabric
- Policy Enforcement Group
- Sky ATP Realm
- Threat Prevention Policies for the following threat types:
 - C&C Server
 - Infected Hosts
 - Geo IP

No Sky ATP (no selection)—You would make no Sky ATP selection to configure SDSN using custom feeds. Custom feeds are available for dynamic address, whitelist, blacklist, and infected hosts. With this setting, there are no feeds available from Sky ATP, but the benefits of Secure Fabric, Policy Enforcement Groups, and Threat Prevention policies provided by Policy Enforcer are available. Infected hosts is the only prevention type available.

Here is the No selection workflow:

- Secure Fabric
- Policy Enforcement Group
- Custom Feeds
- Threat Prevention Policies for the following threat type:
 - Infected Hosts

NOTE: Moving between configuration types is not supported in all cases. You can only move from one Sky ATP Configuration Type to a “higher” configuration type. You cannot move to a lower type. Please note the following hierarchy:

- Sky ATP with SDSN (highest)
- Sky ATP
- Cloud feeds only
- No Sky ATP - No selection (lowest)

For each configuration type, certain features and UI pages are available. Please see the links below for details.

- [Features By Sky ATP Configuration Type on page 853](#)
- [Available UI Pages by Sky ATP Configuration Type on page 854](#)

Comparing the SDSN and non-SDSN Configuration Steps

The remainder of this guide describes how to configure Security Director for either Policy Enforcer with Sky ATP (SDSN) or Sky ATP with no Policy Enforcer (non-SDSN). An optional quick setup configuration is available to step you through the configuration tasks. Or you can use Security Director windows to configure each step manually.

[Table 287 on page 856](#) compares the basic steps for both.

Table 287: Comparing the SDSN Configuration Steps to the non-SDSN Configuration Steps

SDSN Configuration Steps	Non-SDSN Configuration Steps
<p>Create your secure fabric.</p> <p>A secure fabric is a collection of sites which contain network devices such as switches, routers, firewalls, and other security devices.</p>	<p>Register one or more Sky ATP accounts.</p>
<p>Create your policy enforcement groups.</p> <p>You can create policy enforcement groups based on, for example, location or IP subnets. Policy enforcement groups are basically endpoints.</p>	<p>Select your SRX Series devices to register. Only SRX Series devices managed by Security Director are supported.</p>
<p>Register one or more Sky ATP accounts.</p>	<p>Create the Sky ATP profiles and policies. You can create C&C (threat score and actions to take), malware and infected host policies.</p>
<p>Create threat prevention policies.</p> <p>Threat prevention policies provide protection and monitoring for selected threat profiles, including command & control servers, infected hosts, and malware.</p>	<p>Add the Sky ATP policy as a rule in your firewall policy.</p>
<p>Apply your threat prevention policies to policy enforcement groups.</p> <p>When threat prevention policies are applied to policy enforcement groups, the system automatically discovers to which sites those groups belong. When you dynamically add sites, the policy enforcement groups and threat prevention policies are updated automatically.</p>

RELATED DOCUMENTATION

[Deploying and Configuring the Policy Enforcer with OVA files | 859](#)

[Policy Enforcer Overview | 836](#)

[Benefits of Policy Enforcer | 838](#)

[Policy Enforcer Components and Dependencies | 844](#)

Deploying and Configuring the Policy Enforcer with OVA files

As with other Juniper Networks virtual appliances, Policy Enforcer requires either a VMware ESX server version 4.0 or later or a VMware ESXi server version 4.0 or later that can support a virtual machine with the following configuration:

- 1 CPU
- 8-GB RAM
- 120-GB disk space

If you are not familiar with using VMware ESX or ESXi servers, see [VMware Documentation](#) and select the appropriate VMware vSphere version.

To deploy and configure the Policy Enforcer with OVA files, perform the following tasks:

1. Download the Policy Enforcer virtual machine OVA image from the Juniper Networks software [download page](#).

NOTE: Do not change the name of the Policy Enforcer virtual machine image file that you download from the Juniper Networks support site. If you change the name of the image file, the creation of the Policy Enforcer virtual machine can fail.

2. Launch the vSphere Client that is connected to the ESX server where the Policy Enforcer virtual machine is to be deployed.
3. Select **File > Deploy OVF Template** from the menu bar.
4. Click **Browse** to locate the OVA file you downloaded in Step 1.
5. Click **Next** and follow the instructions in the installation wizard.

It may take a few minutes to deploy your virtual machine. Once deployed, its name appears in the left side of the vSphere Client.

6. Right-click the virtual machine name in the left side of the vSphere Client and select **Open Console** to start configuring your network settings.
7. Log in to your virtual machine using **root** and **abc123** as the username and password, respectively. You will be required to change the password at a later step.

The welcome page appears.

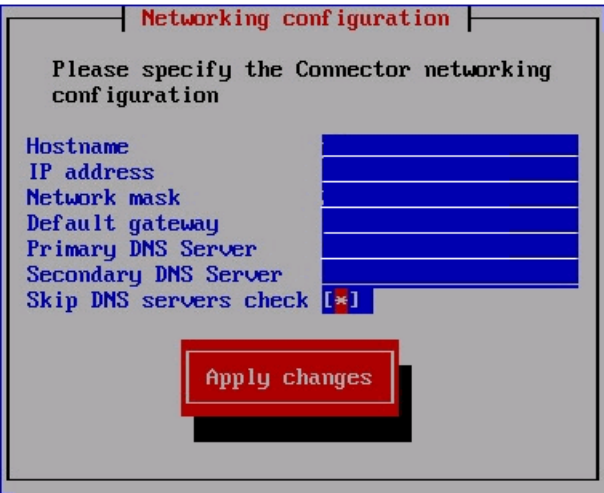

8. Click **OK**.

The End User License Agreement (EULA) window appears.

9. Click **Accept** to acknowledge the EULA. If you do not agree with the EULA, click **Cancel**. Your configuration will stop and you will return to the main vSphere Client page.

The Network configuration page appears. See [Figure 82 on page 860](#).

Figure 82: Defining the Basic Network Configuration Settings

10. Enter the following configuration information.

Option	Description
Hostname	Enter the hostname for the Policy Enforcer virtual machine; for example, pe.juniper.net .

Option	Description
IP address	Enter the IP address for the Policy Enforcer virtual machine. NOTE: Make note of this IP address as you'll need it in a later step.
Network mask	Enter the netmask for the Policy Enforcer virtual machine.
Default gateway	Enter the IP address of the default gateway that connects your internal network to external networks.
Primary DNS server	Enter the IP address of your primary system registered to join the Domain Name System (DNS).
Secondary DNS server	Enter the IP address of a secondary DNS server. Policy Enforcer uses this address only when the primary DNS server is unavailable.
Skip DNS servers check	Select this check box if you do not want to check basic network settings. By default, the system will ping the gateway to ensure it receives a response indicating your settings are correct.

11. Click **Apply Changes**.

Your network settings are applied. A progress window indicates the status.

When the system is finished updating your network settings, an NTP server window appears and prompts you to configure the NTP server list. See [Figure 83 on page 861](#).

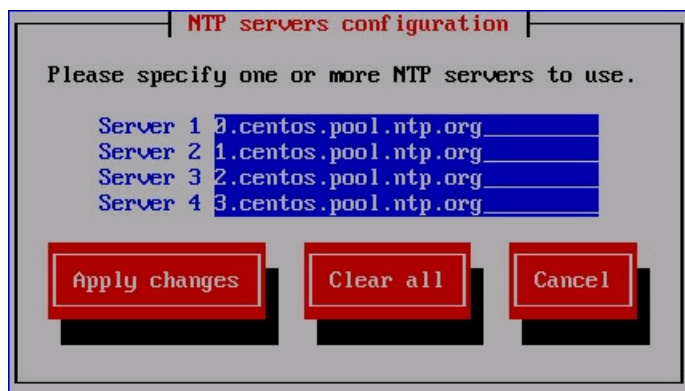

Figure 83: Prompt for Configuring the NTP Servers

12. Click **Yes** to customize the NTP server list. Click **No** to use the default list of 0, 1, 2 and 3.centos.pool.ntp.org.

13. (Optional) Specify the NTP servers to use. See [Figure 84 on page 862](#). Click **Apply Changes** to accept your edits, **Clear All** to clear all fields in this window, or **Cancel** to discard any edits and continue to the next step.

Figure 84: Configuring the NTP Servers

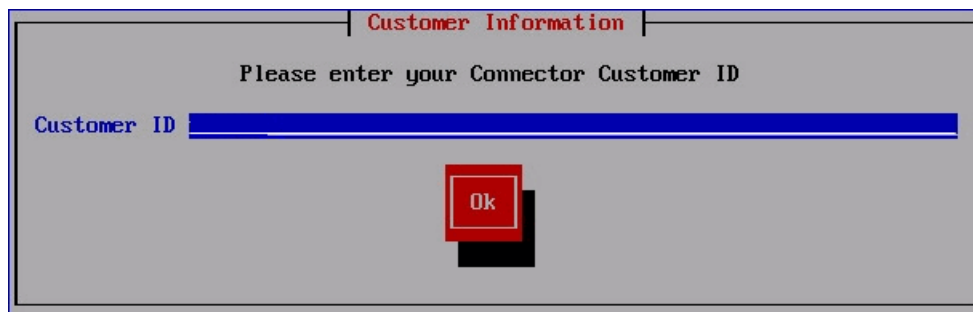

The image shows a dialog box titled "NTP servers configuration". Inside, it says "Please specify one or more NTP servers to use." Below this, there are four lines for server configuration: "Server 1", "Server 2", "Server 3", and "Server 4". Each line has a text input field containing a default IP address: "0.centos.pool.ntp.org", "1.centos.pool.ntp.org", "2.centos.pool.ntp.org", and "3.centos.pool.ntp.org" respectively. At the bottom of the dialog, there are three buttons: "Apply changes", "Clear all", and "Cancel".

The Customer Information page appears. See [Figure 85 on page 862](#).

14. Enter your customer ID. This is your SiteID tied to your support account, that entitles you to use Policy Enforcer. If you don't have a support account with Juniper, then enter any unique 4-128 alphanumeric field (for example **cust01**) to identify this installation of Policy Enforcer.

Figure 85: Entering Customer Information

The image shows a dialog box titled "Customer Information". Inside, it says "Please enter your Connector Customer ID". Below this, there is a label "Customer ID" followed by a long text input field. At the bottom center of the dialog, there is a button labeled "Ok".

15. Click **OK**.

The Root password change page appears. See [Figure 86 on page 863](#).

Figure 86: Changing the Root Password

Root password change

Please change the root password

Password must:

- * Cannot be empty.
- * Be at least 6 characters in length.
- * Must contain at least one lower case character.
- * Must contain at least one number.
- * Must not repeat the Login ID.
- * Must not reverse the Login ID.
- * Must not contain more than three repetitive characters.
- * Must not contain number as the last character.

New root password

Confirm new root password

Ok

16. Enter and re-enter a new administrator password for the Policy Enforcer virtual machine.

Password restrictions are listed in the screen.

NOTE: Make note of this password as you'll need it in a later step.

If you forget your password, see [CentOS root password reset instructions](#).

17. Click **OK**.

The Juniper Networks Policy Enforcer page appears. See [Figure 87 on page 863](#).

Figure 87: Reviewing and Changing Your Configuration Settings.

Juniper Networks Policy Enforcer

Review configuration and finish setup

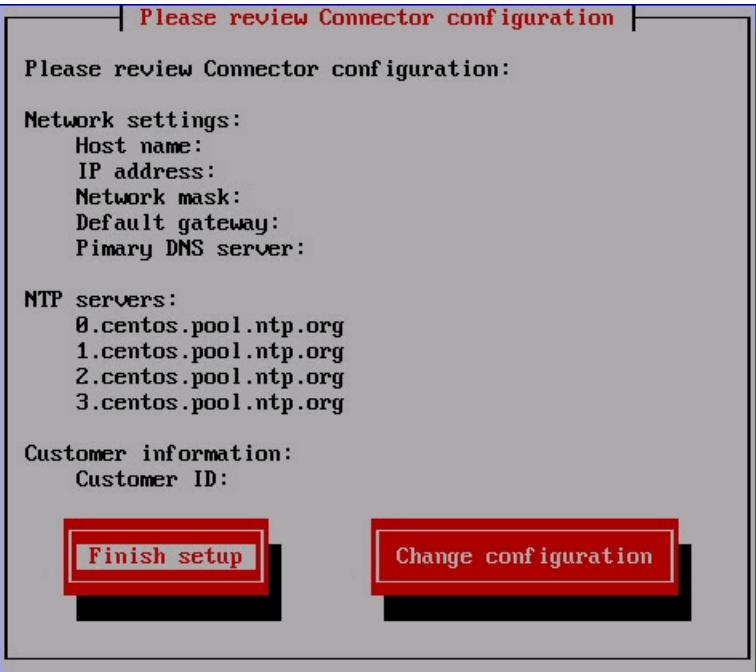

- Change network configuration
- Change NTP configuration
- Change Customer ID
- Change root password
- Troubleshooting menu

18. Select one of the options and press **Enter**.

Option	Description
Review configuration and finish setup	Lets you review the configuration settings you defined one last time before applying them to the Policy Enforcer virtual machine. We recommend that you do not change your configuration settings after Policy Enforcer is set up within Security Director.
Change...	Select a setting to update its value.
Troubleshooting menu	Lets you ping the default gateway and custom IP address and lets you perform a DNS lookup to verify that your settings are correct.

The Review configuration page appears. See [Figure 88 on page 864](#).

Figure 88: Reviewing Your Configuration Settings

19. Review your configuration settings and click **Finish setup**. To change any of the settings, click **Change configuration**.

When you click **Finish setup**, the configuration settings are applied to the Policy Enforcer virtual machine. A status page indicates the progress.

When done, the Setup Complete page appears.

20. Click **Finish** to return to the main vSphere Client page.

NOTE: Each time you log in to the Policy Enforcer virtual machine, you are given the option to review or change any of these settings.

Installing Policy Enforcer with KVM

IN THIS SECTION

- [Installing Policy Enforcer with virt-manager | 866](#)
- [Installing Policy Enforcer with virt-install | 867](#)
- [Configuring Policy Enforcer Settings | 868](#)
- [Connecting to the KVM Management Console | 874](#)

The Policy Enforcer Virtual Appliance Release 17.1R2 and later can be deployed on qemu-kvm (KVM) Release 1.5.3-105.el7 or later which is on CentOS Release 6.8 or later.

NOTE: Juniper Networks does not provide any support for installing and configuring the KVM server. You must install the virtual appliance image and configure it as per the recommended specifications for the virtual appliance. Juniper Networks will provide support only after the Policy Enforcer Virtual Appliance has booted successfully.

The prerequisites to deploy a Policy Enforcer Virtual Appliance on a KVM server are as follows:

- Knowledge about configuring and installing a KVM server.
- The KVM server and supported packages must be installed on a CentOS machine with the required kernels and packages. For information about installing a KVM server and supported packages on CentOS, refer to <http://wiki.centos.org/HowTos/KVM>.
- The Virtual Machine Manager (VMM) client must be installed on your local system.
- You use **virt-manager** or **virt-install** to install Policy Enforcer VMs. See your host OS documentation for complete details on these packages.

The following are the minimum requirements for installing the Policy Enforcer VM.

- 1 CPU
- 8-GB RAM
- 120-GB disk space

This topic includes:

Installing Policy Enforcer with virt-manager

You can install and launch Policy Enforcer with the KVM **virt-manager** GUI package.

Ensure that sure you have already installed KVM, qemu, virt-manager, and libvirt on your host OS.

To install Policy Enforcer with **virt-manager**:

1. Download the Policy Enforcer KVM image from the Juniper software [download site](#).
2. On your host OS, type **virt-manager**. The Virtual Machine Manager appears.

NOTE: You must have admin rights on the host OS to use **virt-manager**.

3. Click **Create a new virtual machine**. The New VM wizard appears .
4. Enter a name for the virtual machine, select **Import existing disk image**, and click **Forward**.
5. Browse to the location of the downloaded Policy Enforcer image and select it.
6. Select **Linux** from the OS type list and select **Show all OS options** from the Version list.
7. Select **Red Hat Enterprise Linux 6** or later from the expanded Version list and click **Forward**.
8. Set the RAM to 8192 MB and set CPUs to 1. Click **Forward**.
9. Under Advanced Options, select **Specify shared device name** and enter the name of the bridge (typically **br0**) into the text box.
10. Click **Finish**. The VM manager creates the virtual machine and launches the Policy Enforcer console.

Installing Policy Enforcer with virt-install

The **virt-install** and **virsh** tools are CLI alternatives to installing and managing Policy Enforcer VMs on a Linux host.

Ensure that sure you have already installed KVM, qemu, virt-install, and libvirt on your host OS.

NOTE: You must have root access on the host OS to use the **virt-install** command.

To install Policy Enforcer with **virt-install**:

1. Download the Policy Enforcer KVM image from the Juniper software [download site](#).
2. On your host OS, use the **virt-install** command with the mandatory options listed in [Table 289 on page 868](#).

NOTE: See the official **virt-install** documentation for a complete description of available options.

Table 289: virt-install Options

Command Option	Description
<code>--name <i>name</i></code>	Name the Policy Enforcer VM.
<code>--ram <i>megabytes</i></code>	Allocate RAM for the VM, in megabytes.
<code>--cpu <i>cpu-model, cpu-flags</i></code>	<p>Enable the vmx feature for optimal throughput. You can also enable aes for improved cryptographic throughput.</p> <p>NOTE: CPU flag support depends on your host OS and CPU.</p> <p>Use virsh capabilities to list the virtualization capabilities of your host OS and CPU.</p>
<code>--vcpus <i>number</i></code>	Allocate the number of vCPUs for the Policy Enforcer VM.
<code>--disk <i>path</i></code>	<p>Specify disk storage media and size for the VM. Include the following options:</p> <ul style="list-style-type: none"> • size=gigabytes • device=disk • bus=ide • format=qcow2
<code>--os-type <i>os-type</i></code>	Configure the guest OS type and variant.
<code>--os-variant <i>os-type</i></code>	
<code>--import</code>	Create and boot the Policy Enforcer VM from an existing image.

The following example creates a Policy Enforcer VM with 8192 MB RAM, 1 vCPUs, and disk storage up to 120 GB:

```
hostOS# virt-install --name vPEM --ram 8192 --cpu SandyBridge,+vmx,-invtsc --vcpus=1
--arch=x86_64 --disk path=/mnt/pe.qcow2,size=120,device=disk,bus=ide,format=qcow2 --os-type
linux --os-variant rhel6 --import
```

Configuring Policy Enforcer Settings

By default, when you create the Policy Enforcer VM through virt-manager or virt-install, the console window appears for you to set up and configure the Policy Enforcer settings. You can open the console at any time after the initial configuration to review or edit your settings.

To configure Policy Enforcer settings:

- 1. Log in to your virtual machine using **root** and **abc123** as the username and password, respectively. You will be required to change the password at a later step.

The welcome page appears.

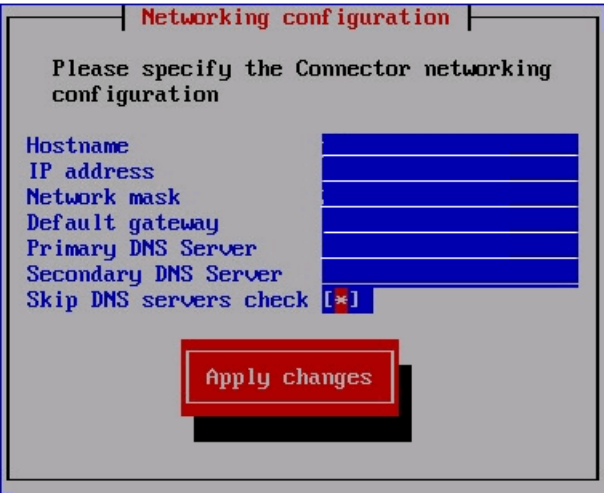

- 2. Click **OK**.

The End User License Agreement (EULA) window appears.

- 3. Click **Accept** to acknowledge the EULA. If you do not agree with the EULA, click **Cancel**. Your configuration will stop and you will return to the main vSphere Client page.

The Network configuration page appears. See [Figure 82 on page 860](#).

Figure 89: Defining the Basic Network Configuration Settings

- 4. Enter the following configuration information.

Option	Description
Hostname	Enter the hostname for the Policy Enforcer virtual machine; for example, pe.juniper.net .
IP address	Enter the IP address for the Policy Enforcer virtual machine. NOTE: Make note of this IP address as you'll need it in a later step.
Network mask	Enter the netmask for the Policy Enforcer virtual machine.

Option	Description
Default gateway	Enter the IP address of the default gateway that connects your internal network to external networks.
Primary DNS server	Enter the IP address of your primary system registered to join the Domain Name System (DNS).
Secondary DNS server	Enter the IP address of a secondary DNS server. Policy Enforcer uses this address only when the primary DNS server is unavailable.
Skip DNS servers check	Select this check box if you do not want to check basic network settings. By default, the system will ping the gateway to ensure it receives a response indicating your settings are correct.

5. Click **Apply Changes**.

Your network settings are applied. A progress window indicates the status.

When the system is finished updating your network settings, an NTP server window appears and prompts you to configure the NTP server list. See [Figure 83 on page 861](#).

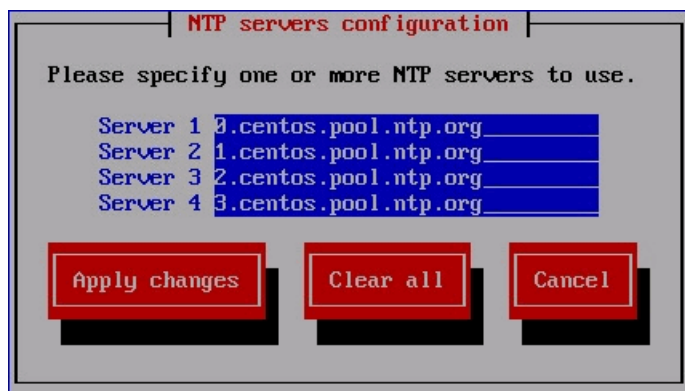

Figure 90: Prompt for Configuring the NTP Servers

6. Click **Yes** to customize the NTP server list. Click **No** to use the default list of 0, 1, 2 and 3.centos.pool.ntp.org.

7. (Optional) Specify the NTP servers to use. See [Figure 84 on page 862](#). Click **Apply Changes** to accept your edits, **Clear All** to clear all fields in this window, or **Cancel** to discard any edits and continue to the next step.

Figure 91: Configuring the NTP Servers

The dialog box is titled "NTP servers configuration" in red text. It contains the instruction "Please specify one or more NTP servers to use." Below this, there are four server entries, each with a label and a text field. The text fields are highlighted in blue. At the bottom, there are three red buttons: "Apply changes", "Clear all", and "Cancel".

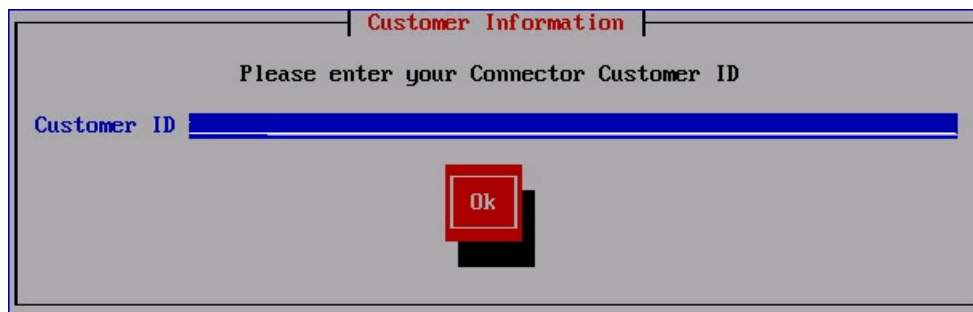

Server	Address
Server 1	0.centos.pool.ntp.org
Server 2	1.centos.pool.ntp.org
Server 3	2.centos.pool.ntp.org
Server 4	3.centos.pool.ntp.org

Buttons: Apply changes, Clear all, Cancel

The Customer Information page appears. See [Figure 85 on page 862](#).

8. Enter your customer ID. This is your SiteID tied to your support account, that entitles you to use Policy Enforcer. If you don't have a support account with Juniper, then enter any unique 4-128 alphanumeric field (for example **cust01**) to identify this installation of Policy Enforcer.

Figure 92: Entering Customer Information

The dialog box is titled "Customer Information" in red text. It contains the instruction "Please enter your Connector Customer ID". Below this, there is a label "Customer ID" followed by a long blue text input field. At the bottom center, there is a red button labeled "Ok".

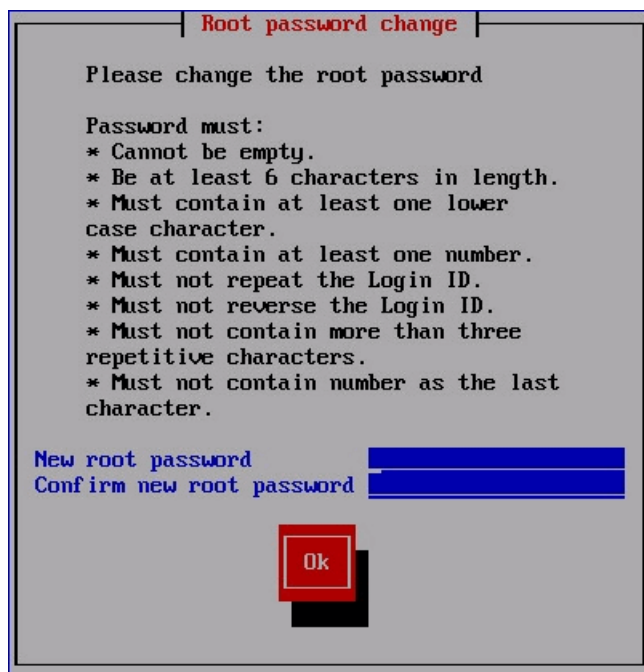

Customer ID

Ok

9. Click **OK**.

The Root password change page appears. See [Figure 86 on page 863](#).

Figure 93: Changing the Root Password

10. Enter and re-enter a new administrator password for the Policy Enforcer virtual machine.

Password restrictions are listed in the screen.

NOTE: Make note of this password as you'll need it in a later step.

If you forget your password, see [CentOS root password reset instructions](#).

11. Click **OK**.

The Juniper Networks Policy Enforcer page appears. See [Figure 87 on page 863](#).

Figure 94: Reviewing and Changing Your Configuration Settings.

12. Select one of the options and press **Enter**.

Option	Description
Review configuration and finish setup	Lets you review the configuration settings you defined one last time before applying them to the Policy Enforcer virtual machine. We recommend that you do not change your configuration settings after Policy Enforcer is set up within Security Director.
Change...	Select a setting to update its value.
Troubleshooting menu	Lets you ping the default gateway and custom IP address and lets you perform a DNS lookup to verify that your settings are correct.

The Review configuration page appears. See [Figure 88 on page 864](#).

Figure 95: Reviewing Your Configuration Settings

13. Review your configuration settings and click **Finish setup**. To change any of the settings, click **Change configuration**.

When you click **Finish setup**, the configuration settings are applied to the Policy Enforcer virtual machine. A status page indicates the progress.

When done, the Setup Complete page appears.

14. Click **Finish** to return to the main vSphere Client page.

NOTE: Each time you log in to the Policy Enforcer virtual machine, you are given the option to review or change any of these settings.

Connecting to the KVM Management Console

By default, when you create the Policy Enforcer VM the console window appears for you to set up and configure the Policy Enforcer settings. You can open the console at any time after the initial configuration to review or edit your settings. To do this, you must have the **virt-manager** package or **virsh** installed on your host OS.

To connect to the Policy Enforcer console using **virt-manager**:

1. Launch **virt-manager**.
2. Highlight the Policy Enforcer VM you want to connect to from the list of VMs displayed.
3. Click **Open**.
4. Select **View>Text Consoles>Serial 1**. The Policy Enforcer console appears.

To connect to the Policy Enforcer console with **virsh**:

1. Use the **virsh** console command on the Linux host OS. For example:

```
user@host# virsh console PE-kvm-2
```

```
Connected to domain PE-kvm-2
```

2. The Policy Enforcer console appears.

RELATED DOCUMENTATION

[Policy Enforcer Installation Overview | 857](#)

[Policy Enforcer Ports | 875](#)

Policy Enforcer Ports

You will need to open ports for Policy Enforcer to communicate with other products and devices.

[Table 290 on page 875](#) lists the ports that Policy Enforcer uses to communicate with Security Director.

Table 290: Policy Enforcer Ports to Communicate with Security Director

Service	Protocol	Port	In	Out
HTTPS	TCP	8080	X	
HTTPS	TCP	443		X

[Table 291 on page 875](#) lists the ports that Policy Enforcer uses to communicate with SRX Series Devices.

Table 291: Policy Enforcer Ports to Communicate with SRX Series Devices

Service	Protocol	Port	In	Out
HTTPS	TCP	443	X	

[Table 292 on page 876](#) lists the ports that Policy Enforcer uses to communicate with the Sky ATP server to download feeds.

NOTE: Connectivity between Sky ATP and Policy Enforcer is certificate-based. Once the trust is established, every request is within a context of valid token.

Table 292: Policy Enforcer Ports to Communicate with cloudfeeds.sky.junipersecurity.net

Service	Protocol	Port	In	Out
HTTPS	TCP	443		X

Table 293 on page 876 lists the remaining Policy Enforcer services.

Table 293: Policy Enforcer Services

Service	Comments
DNS	Used for basic network connection.
NTP	Used to synchronize system clocks with the Network Time Protocol (NTP).

If you are using NSX with Policy Enforcer (or Security Director), the following ports must be opened on NSX.

Table 294: NSX Ports

Port	In	Out	Comments
443	X		Used for communication between NSX and Security Director.
7804	X		Used for outbound SSH based auto discovery of devices.
22	X		Used for host management and image upload over sftp.

[Deploying and Configuring the Policy Enforcer with OVA files | 859](#)

[Installing Policy Enforcer with KVM | 865](#)

Identifying the Policy Enforcer Virtual Machine In Security Director

You must identify the Policy Enforcer virtual machine in Security Director so that they can communicate with each other. To do so, follow these steps:

1. Log in to Security Director and select **Administration > PE Settings**.

2. Enter the IP address of the Policy Enforcer virtual machine and the root password and click **OK**.

3. Select a Threat Prevention Type:

- Sky ATP with PE—All SDSN features and threat prevention types are available.

NOTE: If you upgrade from cloud feeds or Sky ATP, you cannot roll back again. Upgrading resets all devices previously participating in threat prevention. Use the setup wizard to expedite the process configuring threat prevention policies.

- Sky ATP—All threat prevention types are available: Command and control server, Geo IP, and Infected hosts.

NOTE: If you upgrade from cloud feeds only to Sky ATP, you cannot roll back again. Upgrading resets all devices previously participating in threat prevention, and you must re-enroll them with Sky ATP. Use the setup wizard to expedite the process configuring threat prevention policies.

- Cloud Feeds only—Command and control server and Geo IP are the only threat prevention types available.

For more information on these threat prevention types, see [“Policy Enforcer Settings” on page 884](#).

If you change the Policy Enforcer VM password (see [Deploying and Configuring the Policy Enforcer Virtual Machine](#)), the Policy Enforcer VM still communicates with Security Director even if you do not update the Policy Enforcer password in the **Administration > PE Settings** window in Security Director. You can, however, update the information in the PE Settings page with the new password to keep your credentials consistent.

[Obtaining a Sky ATP License | 878](#)

[Policy Enforcer Overview | 836](#)

[Benefits of Policy Enforcer | 838](#)

[Policy Enforcer Components and Dependencies | 844](#)

Obtaining a Sky ATP License

Contact your local sales office or a Juniper Networks partner to place an order for a Sky ATP premium license. Once the order is complete, an authorization code is e-mailed to you. You will use this code in conjunction with your SRX Series device serial number to generate a premium license entitlement. (Use the **show chassis hardware** CLI command to find the serial number of the SRX Series device.)

To obtain a Sky ATP premium or basic license, follow these steps:

1. Go to https://www.juniper.net/generate_license/ and log in with your Juniper Networks Customer Support Center (CSC) credentials.
2. In the Generate Licenses list, select J Series Service Routers and SRX Series Devices.
3. Using your authorization code and SRX Series serial number, follow the instructions to generate your license key. (Note that you do not enter this license key anywhere.)

Once generated, your license key is automatically transferred to the cloud server. It can take up to 24 hours for your activation to be updated in the Sky ATP cloud server.

The free version does not require you to generate a license. The SRX Series device only needs to be enrolled to the cloud, and it will automatically be entitled to the free version.

Unlike with physical SRX Series devices, you must install Sky ATP premium licenses onto your vSRX instances. Installing the Sky ATP license follows the same procedure as with most standard vSRX licenses. For more information on installing the Sky ATP license onto your vSRX instance, see the *License Management and vSRX Deployments* section within [Managing the Sky Advanced Threat Prevention License](#).

[Creating a Sky ATP Cloud Web Portal Login Account](#) | 879

[Policy Enforcer Overview](#) | 836

[Benefits of Policy Enforcer](#) | 838

[Policy Enforcer Components and Dependencies](#) | 844

Creating a Sky ATP Cloud Web Portal Login Account

To create a Sky ATP account, you must first have a Customer Support Center (CSC) user account. For more information, see [Creating a User Account](#). If you forget to do this step, you will be reminded during the quick setup.

1. Go to <https://sky.junipersecurity.net> and select your region. On the next screen, click **Create a security realm**.
2. Enter the following required information and continue to click **Next** until you are finished:
 - Your single sign-on or Juniper Networks CSC credentials.
 - A security realm name — for example, **Juniper-Mktg-Sunnyvale**. Realm names can only contain alphanumeric characters and the dash (“-”) symbol.
 - Your contact information.
 - An e-mail address and password. This will be your login information to access the Sky ATP management interface.
3. When you click **Finish**, you are automatically logged in and taken to the Sky ATP Web UI dashboard.

RELATED DOCUMENTATION

[Loading a Root CA | 879](#)

[Using Guided Setup for Sky ATP with SDSN | 937](#)

[Using Guided Setup for Sky ATP | 940](#)

Loading a Root CA

After the Policy Enforcer virtual machine is configured and created and before creating any ATP policy, you must set up certificates on any Sky ATP-supported SRX Series device. For a list of SkyATP- supported devices, see [Sky ATP Supported Platforms Guide](#).

NOTE: The following is simply an example. You will need to modify the group name, profile and policy name to match your configuration.

To set up certificates for Policy Enforcer:

1. Create the CA profile using the following CLI command. A CA profile configuration contains information specific to a CA.

```
root@host# request security pki generate-key-pair certificate-id ssl-inspect-ca size 2048 type rsa
root@host# request security pki local-certificate generate-self-signed certificate-id ssl-inspect-ca
domain-name www.juniper.net subject "CN=www.juniper.net,OU=IT,O=Juniper
Networks,L=Sunnyvale,ST=CA,C=US" email security-admin@juniper.net
```

2. Configure the CA profile.

NOTE: The CA profile name must be policyEnforcer.

```
root@host# set security pki policyEnforcer ssl-inspect-ca ca-identity ssl-inspect-ca
root@host# set security pki policyEnforcer ssl-ca ca-identity ssl-ca
```

3. Load the default trusted CA.

```
root@host# request security pki ca-certificate ca-profile-group load ca-group-name All-Trusted-CA-Def
filename default
```

4. Enable HTTPS on the threat prevention policy.

When creating your threat prevention policy (in Security Director, select **Configure>Threat Prevention > Policy**), enable the **Scan HTTPS** option to scan files downloaded over HTTPS. For more information on creating threat prevention policies, see the Security Director online help.

When you enable HTTPS on the threat prevention policy, Policy Enforcer sends the following configuration to the devices:

```
##Security Firewall Policy : trust - untrust##
set security policies from-zone trust to-zone untrust policy
PolicyEnforcer-Rule1-1 then permit application-services ssl-proxy profile-name
policyEnforcer
##Security Firewall Policy : global ##
set security policies global policy PolicyEnforcer-Rule1-1 then permit
application-services ssl-proxy profile-name policyEnforcer
##SSL Forward proxy Profile Configurations##
set services ssl proxy profile policyEnforcer trusted-ca all
set services ssl proxy profile policyEnforcer root-ca ssl-inspect-ca
```

5. Export the locally generated certificate from the SRX Series device and install it on clients as a trusted CA to avoid some of the certificate errors that may occur.

Each website or browser behaves slightly different. Some require exceptions to be added to your browser to display the content while others may not work because the local certificate is weak.

```
root@host# request security pki local-certificate export certificate-id  
ssl-inspect-ca type pem filename ssl-inspect-ca.pem
```

6. (Optional) You can limit some certificate warning messages using the following CLI command:

```
root@host# set services ssl proxy profile policyEnforcer actions  
ignore-server-auth-failure
```

Upgrading Your Policy Enforcer Software

To upgrade to the latest release of Policy Enforcer, download and run the rpm file available from Juniper Network's software download page. You must have a version of Policy Enforcer already installed to run the upgrade script. If you do not, download the latest software version from the [Policy Enforcer software download page](#) and follow the [Policy Enforcer Installation Overview](#) instructions.

NOTE: You can upgrade only from the previous release. For example, you can upgrade from 16.1R1 to 16.1R2 or from 16.1R2 to 17.1. You cannot skip a release. For example, upgrading from 16.1R1 to 17.1R1 is not supported.

To upgrade your Policy Enforcer software to the latest release:

1. Access the Policy Enforcer software download page
<https://www.juniper.net/support/downloads/?p=sdpe>
2. Select the Software tab.
3. From the Version drop-down menu, select the version you want to install.

4. From under the Application Package heading, download the Policy Enforcer RPM to your Policy Enforcer virtual appliance.
5. On your Policy Enforcer virtual appliance, change directory to where you downloaded the RPM bundle and install it using the following command:

```
[root@hostname~]# rpm -Uvh filename.rpm
```

For example:

```
[root@hostname~]# rpm -Uvh Policy_Enforcer-18.1R1-470-PE-Upgrade.rpm
```

It may take a few minutes to install the RPM bundle. Once installed, the Policy Enforcer screens within Security Director and any schema changes are updated. The configuration settings you used when you deployed the Policy Enforcer VM are retained.

To verify your upgrade:

- In Security Director, select **Administration > PE settings**. This page shows the current installed Policy Enforcer version number.
- Check the log file for any errors.
- (Upgrading from 16.1R1 to 16.2R1) Check the `/var/log/pe_upgrade.log` file for any errors. The following is an example output of the `pe_upgrade.log` file for a successful upgrade.

```
Location: /var/log/pe_upgrade.log
Update text:

 - /var/log/pe_upgrade_nsx.log

NSX Migration Instructions from Policy Enforcer Release 17.1R1 to 17.2R1

After successfully upgrading to Policy Enforcer Release 17.2R1 and when all the Policy Enforcer services and NSX micro service are up and running, the administrator must run the **nsxmicro_sdsn_migrate** script manually. After the successful installation of the script, the SDSN resources such as Connector instance, Secure Fabric, and Policy Enforcement Groups (PEG) are created for the NSX Managers that are already discovered in Security Director.

If the SDSN resources are already present in the upgraded version of the software, a message is displayed showing that the NSX Manager with SDSN resources are already present in the NSX database.

- Cisco ISE Configuration for Third-Party Plug-in | 924

Policy Enforcer Settings

To access this page, in the Security Director UI, navigate to **Administration > Policy Enforcer > Settings**.

Before You Begin

- Policy Enforcer Release version and Security Director Release version must be compatible. The Settings page shows the current release version of Policy Enforcer. If there is an incompatibility, an error message is shown that there is a mismatch between Security Director and Policy Enforcer release versions. To know more about the supported software versions, see *Policy Enforcer Release Notes*.

You cannot proceed further if the Policy Enforcer and Security Director Release versions are incompatible.

- A valid Policy Enforce VM password is required to have a fully functional Policy Enforcer. If the password is valid, a message is shown at the top of the Settings page that the Policy Enforcer Space user (pe_user) password is currently valid and the date by when the password expires. The pe_user has the same capabilities as the super user.

If the password is invalid, an error message is shown at the top of the Settings page. To fix this issue, login to the Policy Enforcer VM, change the root password, and then enter a new value in the Settings page.

- Policy Enforcer with Security Director can be used in four different configuration types. For each configuration type, certain features are available. Read the following topic: [“Sky ATP Configuration Type Overview” on page 850](#) before you make a Sky ATP Configuration Type selection on the Policy Enforcer Settings page.
- If you are using Sky ATP without SDSN or Cloud Feeds only, you must still download Policy Enforcer and create a policy enforcer virtual machine.
- Sky ATP license and account are needed for all configuration types (Sky ATP with SDSN, Sky ATP, and Cloud Feeds only). If you do not have a Sky ATP license, contact your local sales office or Juniper Networks partner to place an order for a Sky ATP premium license. If you do not have a Sky ATP account, when you configure Sky ATP, you are redirected to the Sky ATP server to create one. Please obtain a license before you try to create a Sky ATP account. Refer to [“Policy Enforcer Installation Overview” on page 857](#) for instructions on obtaining a Sky ATP premium license.

To set up a Sky ATP Configuration Type, you must do the following:

1. Enter the IP address for the policy enforcer virtual machine. (This is the IP address you configured during the PE VM installation. You can locate this IP address in the vSphere Center portal.)
2. Enter the password for the policy enforcer virtual machine. (This is the same password you use to login to the VM with your root credentials. Note that the username defaults to root)

NOTE: Refer to [“Deploying and Configuring the Policy Enforcer with OVA files” on page 859](#) for instructions on downloading Policy Enforcer and creating your policy enforcer virtual machine.

3. Select a Sky ATP Configuration Type. If you do not select a type, Policy Enforcer works in *default mode*. (See [“Sky ATP Configuration Type Overview” on page 850](#) for more information.)
 - **Sky ATP with SDSN**—All Policy Enforcer features and threat prevention types are available.

NOTE: If you upgrade from cloud feeds or Sky ATP, you cannot roll back again. Upgrading resets all devices previously participating in threat prevention. Use guided setup to expedite the process configuring threat prevention policies.

See the following topics to configure Sky ATP with SDSN:

- [Using Guided Setup for Sky ATP with SDSN on page 937](#)

- [Configuring Sky ATP with SDSN \(Without Guided Setup\) Overview on page 948](#)
- **Sky ATP**—All threat prevention types are available: Command and control server, Geo IP, and Infected hosts.

NOTE: If you upgrade from cloud feeds only to Sky ATP, you cannot roll back again. Upgrading resets all devices previously participating in threat prevention, and you must re-enroll them with Sky ATP. Use the setup wizard to expedite the process configuring threat prevention policies.

See the following topics to configure Sky ATP:

- [Using Guided Setup for Sky ATP on page 940](#)
- [Configuring Sky ATP \(No SDSN and No Guided Setup\) Overview on page 970](#)
- **Cloud feeds only**—Command and control server, infected hosts, and Geo IP are the threat prevention types available.

See the following topic to configure Cloud feeds only:

- [Configuring Cloud Feeds Only on page 983](#)
- **No Selection**—Custom feeds only. Infected hosts is the prevention type available.

See the following topic to configure “no selection”:

- [Using Guided Setup for No Sky ATP \(No Selection\) on page 944](#)
4. Polling timers affect how often the system polls to discover endpoints. There are two polling timers, one that polls network wide and one that polls site wide. They each have default settings, but you can change those defaults to poll more or less often.
 - Network wide polling interval (value in hours): The default is 24 hours. You can set this range from between 1 to 48 hours. This timer polls all endpoints added to the secure fabric.
 - Site wide polling interval (value in minutes): The default is 5 minutes. You can set this range from 1 minute to 60 minutes. This timer polls infected endpoints moving within the sites that are a part of Secure fabric.
 5. Click the **Download** button to view or save Policy Enforcer data logs to your local system. These logs are in a compressed file format.

Policy Enforcer Dashboard Widgets

Policy Enforcer Connector Overview

Configure a connector for third-party products (non-Juniper Networks) to unify policy enforcement across all network elements. This protects endpoints, wired and wireless, connecting to third-party devices as well as Juniper devices.

For Policy Enforcer to provide threat remediation to endpoints connecting through third-party devices, it must be able to authenticate those devices and determine their state. It does this using a tracking and accounting threat remediation plug-in to gather information from a RADIUS server and enforce policies such as terminate session and quarantine.

NOTE: All third-party switches being used with Policy Enforcer must support AAA/RADIUS and Dynamic Authorization Extensions to RADIUS protocol (RFC 3579 and RFC 5176).

NOTE: All Cisco Systems switch models that adhere to Radius IETF attributes and support Radius Change of Authorization from Aruba ClearPass are supported by Policy Enforcer for threat remediation.

Once configured, the connector uses an API to gather endpoint MAC address information from the RADIUS server. If a host is found to be suspicious, the RADIUS server sends a CoA to disconnect the active session and quarantine the host. Once the threat has been mitigated, the interface can return to the network again, but must be authorized to do so by Policy Enforcer using the plug-in and information gathered from the RADIUS server.

Once you have a connector configured, the following information is provided on the Connectors main page.

Table 295: Connectors Information- Main Page

Field	Description
Name	The name you entered for the connector.

Table 295: Connectors Information- Main Page (*continued*)

Field	Description
Type	This field always reads Third Party Switch at this time.
Status	<p>The current status of the connector. (Active or Inactive.)</p> <p>Hover over the status to see more details of connector instances and their respective status.</p> <p>The following statuses are shown:</p> <ul style="list-style-type: none"> • Active status with green icon—All connector instances inside a connector are active • Inactive status with red icon—All connector instances inside a connector are inactive • Active status with red icon—One of the connectors is inactive and other connectors are active. • In progress status with green icon—All connectors are still in progress. • Pending (not in progress) status with green icon—All connectors are still pending.
Description	Specifies the description of a connector.
Identity Server	Specifies the IP address of the product management server.
IP Address	The IP address of the ClearPass RADIUS server.

Benefits of Policy Enforcer Connector

- **Custom threat feed and automation** - Automates the threat remediation workflows for third-party products.
- **RESTful APIs** - Provides a network vendor agnostic mechanism for threat remediation. Enables you to automate configuration and management of physical, logical, or virtual devices.

RELATED DOCUMENTATION

[ClearPass Configuration for Third-Party Plug-in | 917](#)

[Cisco ISE Configuration for Third-Party Plug-in | 924](#)

[Creating a Policy Enforcer Connector for Third-Party Switches | 898](#)

Creating a Policy Enforcer Connector for Public and Private Clouds

To access this page, select **Administration > Policy Enforcer > Connectors**.

Before You Begin

- For Amazon Web Services (AWS) connector:
 - Create access key and password for your AWS account. This will be a unique username and password for your Amazon account required to create a connector. See [Managing Access Keys for Your AWS Account](#).
 - Create Virtual Private Clouds(VPC) for the required region. See [Getting Started With Amazon VPC](#).
 - Instantiate vSRX instance in the required VPC and set the tag identifier to AWS_SDSN_VSRX.
 - Create a Security Group in AWS required to create a threat prevention policy for the AWS connector.
 - Deploy workloads in the required VPC and set the resource tags to the workloads.

To configure threat remediation for a public or private cloud, you must install and register the threat remediation plug-in with Policy Enforcer as follows:

1. Select **Administration > Policy Enforcer > Connectors**.

The Connectors page appears.

2. Click the create icon (+).

The Create Connector page appears.

3. Complete the configuration using the information in [Table 296 on page 889](#).

4. Click **OK**.

NOTE: Once configured, you select the connector name as an Enforcement Point in your Secure Fabric.

Table 296: Fields on the Create Connector Page for AWS and Contrail

Field	Description
<i>General</i>	

Table 296: Fields on the Create Connector Page for AWS and Contrail (*continued*)

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63 characters maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.
Connector Type	Select Amazon Web Services or Contrail from the list to connect to your secure fabric and create policies for this network.
IP Address/URL	<p>Enter the IP (IPv4 or IPv6) address or URL of AWS or Contrail.</p> <p>For AWS, this field is set to www.aws.amazon.com, by default. This is where all VPCs are located. You cannot edit this field.</p>
Port	<p>For AWS connector, the port is set to 443 by default and you cannot edit this field.</p> <p>For Contrail connector, provide the port number as 8081.</p>
Username	<p>Enter the username of the server for the selected connector type.</p> <p>For AWS, enter the generated access key for your Amazon account. This is not same as your Amazon account username.</p>
Password	<p>Enter the password for the selected connector type.</p> <p>For AWS, enter your secret password generated along with your access key. This is not same password as your amazon account.</p>
<i>Network Details</i>	

Table 296: Fields on the Create Connector Page for AWS and Contrail (continued)

Field	Description
Connector Type: AWS Virtual Private Clouds	<p>One or more virtual networks under the AWS account are discovered. They are called virtual private cloud (VPC). Only VPCs having vSRX instances deployed are managed. The VPCs are region specific. Select a region from the Region list and the corresponding VPCs are listed. By default, the VPCs for the first available region are listed.</p> <p>Security Director suggests a default Secure Fabric site name for the VPC, in the <code><connector name>_<vpc name>_site</code> format. Click the Secure Fabric site name to edit it. When you edit the name, you will also see the other Secure Fabric sites that do not have any switches or connectors assigned to them. You can also assign these Secure Fabric sites to the connectors. If the edited site name is already existing with a connector or a switch, an alert message is shown and the Secure Fabric site name is reverted to its previous name.</p> <p>You must enable either Threat Remediation or Next Generation Firewall options or both. You cannot create a connector instance without enabling at least one option. If you navigate to the next page without enabling these options, an error message is shown insisting the user to enable either Threat Remediation or Next Generation Firewall to proceed further.</p> <p>You can get a detailed view of the VPC by hovering over the name and clicking the Detailed View icon. See “Viewing VPC or Projects Details” on page 905.</p> <p>NOTE: You can perform search on VPCs. Search is not supported for the site names.</p>

Table 296: Fields on the Create Connector Page for AWS and Contrail (*continued*)

Field	Description
Connector Type: Contrail Project	<p>Tenant information determined from the Contrail connector is listed.</p> <p>Security Director suggests a default site name for the project, in the <connector name>_<project name>_site format. Click the site name to edit it. When you edit the site name, you will also see the other sites that do not have any switches or connectors assigned to them. You can also assign these sites to the connectors. If the edited site name is already existing with a connector or a switch, an alert message is shown and the site name is reverted to its previous name.</p> <p>You must enable either Threat Remediation or Next Generation Firewall options or both. You cannot create a connector instance without enabling at least one of the two options. If you navigate to the next page without enabling these options, an error message is shown insisting the user to enable either Threat Remediation or Next Generation Firewall to proceed further.</p> <p>You can get a detailed view of the project by hovering over the name and clicking the Detailed View icon. See “Viewing VPC or Projects Details” on page 905.</p> <p>NOTE: You can perform search on Project names. Search is not supported for the site names.</p>
Subnets	<p>The subnet information for Contrail and AWS is determined from the respective systems. For AWS, subnets are the availability zones and for Contrail, subnets are virtual networks. You can create Policy Enforcement Groups for one or more of the subnets, if threat remediation is selected.</p> <p>Both AWS and Contrail subnets are allocated to be within the tenant IP Address Management (IPAM) scheme.</p>
Configuration	

Table 296: Fields on the Create Connector Page for AWS and Contrail (continued)

Field	Description
Configuration	

Table 296: Fields on the Create Connector Page for AWS and Contrail (*continued*)

Field	Description
	<p><i>Metadata</i></p> <p>Specifies the resource tag information and the resource tag values that you have determined from the projects or VPC. The tag information appears only if the Next Generation Firewall option is enabled.</p> <p>For AWS connector, the resource tag values are fetched from AWS for all the endpoints and then mapped them to the Security Director generated metadata names.</p> <p>Based on the resource tag name, Security Director checks if a metadata with the same resource tag name is already available. If available, it automatically maps the resource tag name to its metadata. If there is no match found, Security Director suggests a new metadata name for the corresponding tag. The suggested metadata name is same as the resource tag name. You can also edit the suggested metadata name and customize the resource tag name.</p> <p>However, in the Generated MetaData Name column, you cannot use the following predefined metadata names:</p> <ul style="list-style-type: none"> • Tenant • Provider • Controller <p>If you provide these names, an appropriate error message is shown to choose a different name.</p> <p>Select the Map option to map the resource tag to the generated Security Director Metadata while creating the connector instance. If the Map option is not selected, the connector instance is created for a project or VPC without any resource tags. For example, if you have multiple resource tags for a project, you can choose one or more resource tags to map to the corresponding generated metadata, by selecting the Import option. The project or VPC with the selected resource tags are created when the connector instance is created.</p> <p>Mapping of Contrail and AWS connector resource tags to Security Director metadata enables you to create the next generation firewall policy definitions for the source and destination rules, based on the metadata expressions.</p>

Table 296: Fields on the Create Connector Page for AWS and Contrail (continued)

Field	Description
	<p>Policy Enforcer dynamically determines the matching VM instances in AWS or Contrail connector to the metadata expressions and pushes the IP address content as dynamic address groups to the enforcement points in the tenant specific vSRX firewall instance.</p> <p>In the Configuration Value column, provide any additional information required for this particular connector connection. For example, if the connector type is ForeScout CounterACT, you are required to provide the WebAPI username and password. Similarly for other connectors if the additional configuration parameters are required, they are listed in this column.</p> <p>After the successful completion, the subnet you have created is mapped to that particular connector instance.</p> <p>For AWS, provide the following configuration parameters:</p> <ul style="list-style-type: none"> • SRX username—Specify the username of the vSRX device that you have instantiated for a VPC. • SRX identifier tag—Specify the tag name of the vSRX device, if the recommended vSRX name was not used. If you do not specify any value for this field, Policy Enforcer uses vSRX as a default tag name to identify the device. <p>This enables discovery of this particular vSRX device in Junos Space. This vSRX device is also added to a specific secure fabric site.</p> <ul style="list-style-type: none"> • Infected Host Security Group—Specify the security group name that you would want to tag an infected workload for threat remediation. • SRX authentication key—Specify the authentication key file to access the vSRX device. Editing this in the grid prompts you to either upload the authentication key file or view an already existing uploaded authentication key. <p>For Contrail, provide the following configuration parameters:</p>

Table 296: Fields on the Create Connector Page for AWS and Contrail (*continued*)

Field	Description
	<ul style="list-style-type: none"> • SRX username • SRX password • Infected host security group

NOTE:

- For AWS and Contrail connectors, the site association is achieved in the Connectors page itself.
- When a connector is added to the site, Policy Enforcer discovers the vSRX Series associated with the connector and assigns it to the site. Hover over the connector name to view the corresponding vSRX with its IP address as a tool tip.
- If the mode in PE Setting page is SDSN with SKYATP, then you must create a SkyATP realm and assign the sites associated with the VPC or Project to the realm. Otherwise the vSRX instances in the VPC or Project does not download the dynamic address group objects, that is the list of workloads in the VPC or Project that match a policy metadata expression.

Threat Remediation Workflow

Once you create an AWS or a Contrail connector with Threat Remediation option, a site is created in the Secure Fabric page.

Perform the following actions for threat remediation:

1. Select **Configure > Threat Prevention > Sky ATP Realms**.

Select the associated Secure Fabric sites to the respective VPC or Project that is successfully added. Add the secure fabric site to a Sky ATP realm and enrol the vSRX devices to the Sky ATP. Enroll devices by clicking **Add Devices** in the list view once the realm is created.

2. Select **Configure > Shared Objects > Policy Enforcement Groups**.

Click the add icon to create a new policy enforcement group. You will see a list of all subnets that you have created in a VPC. Select the required subnets for this VPC and create a policy enforcement group. Associate this policy enforcement group to threat remediation policy.

3. Select **Configure > Threat Prevention > Policies**.

Click the add icon to create a new threat prevention policy. Add the threat prevention policy, including profiles for one or more threat types. The security group that you had selected during connector configuration is used when the host gets infected within a corresponding VPC.

Next Generation Firewall Workflow

When you create an AWS or a contrail connector with Next Generation Firewall option, it means that for a particular VPC, Layer 7 firewall policy is enabled. Perform the following actions to enable next generation firewall:

1. Select **Configure > Firewall Policy**.

2. Select the policy for which you want to define rules and click **Add Rule**.

The Create Rules page appears.

3. In the General tab, enter the name of the rule and description of the rule

4. In the Source tab, click **Select** for the Address(es) field to select the source address.

The Source Address page appears.

- In the Address Selection field, click **By Metadata Filter** option.
- In the Metadata Provider field, select **PE** as a provider from the list.
- In the Metadata Filter field, all the generated metadatas during the connector configuration are listed. Using these metadatas, create a required metadata expression. For example, Application = Web and Tier = App.
- In the Matched Addresses field, addresses matching the selected metadata are listed. This address is used as a source address. For every metadata expression, a unique dynamic address group(DAG) is created.
- Click **Ok** and complete configuring other parameters for the rule.
- Publish and update the configuration immediately or schedule it later.

Creating a Policy Enforcer Connector for Third-Party Switches

To access this page, select **Administration > Policy Enforcer > Connectors**.

Before You Begin

- Have your ClearPass, Cisco ISE, and , ForeScout server information available.
- To obtain an evaluation copy of ForeScout CounterACT to use with Policy Enforcer, click [here](#).
- Once configure, you select the Connector as an Enforcement Point in your Secure Fabric.
- Review the “[Policy Enforcer Connector Overview](#)” on [page 887](#) topic.
- To create a connector for a public or a private cloud, see “[Creating a Policy Enforcer Connector for Public and Private Clouds](#)” on [page 889](#).

To configure threat remediation for third-party devices, you must install and register the threat remediation plug-in with Policy Enforcer as follows:

1. Select **Administration > Policy Enforcer > Connectors**.

The Connectors page appears.

2. Click the create icon (+).

The Create Connector page appears.

3. Complete the configuration using the information in [Table 297 on page 898](#).

4. Click **OK**.

NOTE: Once configured, you select the connector name as an Enforcement Point in your Secure Fabric.

Table 297: Fields on the Create Connector Page

Field	Description
<i>General</i>	
Name	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63 characters maximum.

Table 297: Fields on the Create Connector Page (*continued*)

Field	Description
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.
Connector Type	Select the required third-party network of devices to connect to your secure fabric and create policies for this network. The available connectors are Cisco ISE, HP ClearPass, and ForeScout CounterACT.
IP Address/URL	Enter the IP (IPv4 or IPv6) address of the product management server.
Port	Select the port to be used from the list. When this is left blank, port 443 is used as the default.
Username	<p>Enter the username of the server for the selected connector type.</p> <ul style="list-style-type: none"> • ClearPass—Enter the Client ID created while setting up the ClearPass API client. See “ClearPass Configuration for Third-Party Plug-in” on page 917 for details. • Cisco ISE—Enter the username you used when you created the API Client in the Cisco ISE UI. See “Cisco ISE Configuration for Third-Party Plug-in” on page 924. • ForeScout—Enter the username of your DEX plugin. See “Integrating ForeScout CounterACT with Juniper Networks SDSN” on page 907.

Table 297: Fields on the Create Connector Page (*continued*)

Field	Description
Password	<p>Enter the password of the server for the selected connector type.</p> <ul style="list-style-type: none"> • ClearPass—Enter the Client Secret string created while setting up the ClearPass API client. See “ClearPass Configuration for Third-Party Plug-in” on page 917 for details. <p>WARNING: When the Access Token Lifetime expires, you must generate a new Client Secret in ClearPass and update it here too.</p> <ul style="list-style-type: none"> • Cisco ISE—Enter the password you used when you created the API Client in the Cisco ISE UI. See “Cisco ISE Configuration for Third-Party Plug-in” on page 924. • ForeScout—Enter the password of your DEX plugin. See “Integrating ForeScout CounterACT with Juniper Networks SDSN” on page 907.
DEX User Role (For ForeScout connector type only)	<p>Enter the Data Exchange (DEX) user role information to authenticate and connect to the ForeScout connector. See “Integrating ForeScout CounterACT with Juniper Networks SDSN” on page 907.</p>
<i>Network Details</i>	

Table 297: Fields on the Create Connector Page (*continued*)

Field	Description
Subnets	<p>Connector Type: ClearPass, ForeScout CounterACT, and Cisco ISE</p> <p>Add subnet information to the connector configuration so you can include those subnets in groups and then apply policies to the groups. When using Junos Space, Policy Enforcer is able to dynamically discover subnets configured on Juniper switches. Policy Enforcer does not have the same insight with third-party devices.</p> <p>When you add subnets as part of the connector configuration, those subnets become selectable in Policy Enforcement Groups.</p> <p>To add subnet information, do one of the following:</p> <ul style="list-style-type: none"> Click Upload File to upload a text file with an IP address list. <p>Note that the file you upload must contain only one item per line (no commas or semi colons). All items are validated before being added to the list.</p> <p>OR</p> <ul style="list-style-type: none"> Manually enter the IP addresses. For example: 192.168.0.1/24. <p>Click the add icon (+) to add more IP addresses.</p> <p>NOTE: It is mandatory to add at least one IP subnet to a connector. You cannot proceed to next step without adding a subnet.</p>
<i>Configuration</i>	
Configuration	<p>Provide any additional information required for this particular connector connection. After the successful completion, the subnet you have created is mapped to that particular connector instance.</p> <p>NOTE: For ClearPass and Cisco ISE connectors no additional configuration information are required.</p>

NOTE:

- You can associate ClearPass, Cisco ISE, or Forescout connector to a site only in your Secure Fabric.
- When a connector is added to the site, Policy Enforcer discovers the vSRX Series associated with the connector and assigns it to the site. Hover over the connector name to view the corresponding vSRX with its IP address as a tool tip.

WARNING: Ensure that the correct credentials are provided for the ClearPass, Cisco ISE, and ForeScout identity servers. If the initial connection fails, an error message is shown only at that time. Once that message disappears, the status of connectivity to the identity server is not shown in Policy Enforcer. Note that the identity servers are only queried on-demand.

RELATED DOCUMENTATION

[ClearPass Configuration for Third-Party Plug-in | 917](#)

[Cisco ISE Configuration for Third-Party Plug-in | 924](#)

[Editing and Deleting a Connector | 902](#)

[Viewing VPC or Projects Details | 905](#)

Editing and Deleting a Connector

IN THIS SECTION

- [Editing a Connector | 903](#)
- [Deleting a Connector | 904](#)

You can edit or delete a connector from the Connector page.

Editing a Connector

To edit a connector:

1. Select **Administration > Policy Enforcer > Connectors**.

The Connectors page appears.

2. Select the connector you want to edit , and then click the pencil icon.

The Edit Connector page appears displaying the same options that were used to create a new connector. Note that you cannot edit the Name and IP Address/URL fields.

For the AWS connector, when you select a new region, you must enter the configuration parameters for the VPCs in that region. This enables you to maintain different vSRX authentication keys across different regions.

For AWS and Contrail connectors, you can enable or disable the threat remediation and next generation firewall features. If you disable the next generation firewall feature from a project or VPC, that particular project or VPC connector instance will be deleted. The VPCs are deleted from the corresponding regions.

A warning message is shown if you edit the existing generated metadata name. If you edit the existing metadata name, duplicate metadata objects are created that are associated to a firewall policy. To edit the metadata name, select **Configure > Shared Objects > Object Metadata** and edit the required metadata name. Also if the firewall policies are associated with this metadata, select **Configure > Firewall Policy > Policies** and edit the corresponding metadata expression.

To delete the mapping of the tag name with the generated metadata, disable the Map option for the corresponding project or VPC. A warning message is shown that there could be a firewall policy associated with this metadata. Select **Configure > Firewall Policy > Policies** and edit the corresponding metadata expression. The mapping is deleted at the end of the edit workflow. You can also enable the Import option for the tags that were not mapped to the generated metadata while creating the connector.

3. Modify the required field values and click **Save** to save your changes.

If you discover a new connector instance, you can enable the threat remediation or next generation firewall option. A new site is created when you enable one of these options. You must add these new sites to a realm to perform the threat remediation. At the end of the edit connector workflow, a reminder message is shown to add the sites to a realm.

NOTE:

- During the AWS connector editing, if you change the region, changes that you have made in the current session are discarded. An alert message is shown when you change the region.
- During the ClearPass or Cisco ISE connector editing, you cannot delete subnets that are already assigned to a policy enforcement group. However, you can add of any new subnets and edit their descriptions.

Deleting a Connector

To delete a connector:

1. Select **Administration > Policy Enforcer > Connectors**.

The Connectors page appears.

2. Select the connector that you want to delete, and select the delete icon (X).

Deleting a connector deletes the connector instances and its references as well. A warning message is shown listing all the connector instances that will be deleted, before deleting the connector.

3. Click **Delete** to delete your selection.

If the connector instances that you want to delete has PEG assigned, a warning message is shown to unassign the subnets from PEG first and then delete the connector, as shown in [Figure 96 on page 904](#).

Figure 96: Deletion Failed Warning

For AWS and Contrail connectors, if there are connector instances with PEG assigned, only those connector instances are not deleted. However, other connector instances without PEG assigned are deleted.

NOTE:

- You cannot delete the ClearPass or Cisco ISE connector if its subnets are assigned to a policy enforcement group. You must unassign those subnets from that particular policy enforcement group and then delete the connector.
- You cannot delete a connector if it is assigned as an enforcement point to a site. Before deleting a connector, you must unassign it from the site on Secure Fabric.

RELATED DOCUMENTATION

[Policy Enforcer Connector Overview | 887](#)

[Creating a Policy Enforcer Connector for Third-Party Switches | 898](#)

Viewing VPC or Projects Details

To view the complete details of a VPC or a project:

1. Select **Administration > Policy Enforcer > Connectors**.

The Connectors page appears.

2. Select the connector you want to edit , and then click the pencil icon.

The Edit Connector page appears displaying the same options that were used to create a new connector.

3. In the Network Details section, get a detailed view by hovering over the VPC or project name and click the Detailed View icon before the VPC or project name.

The Detailed View page appears, as shown in [Figure 97 on page 906](#).

Figure 97: Detailed View Page

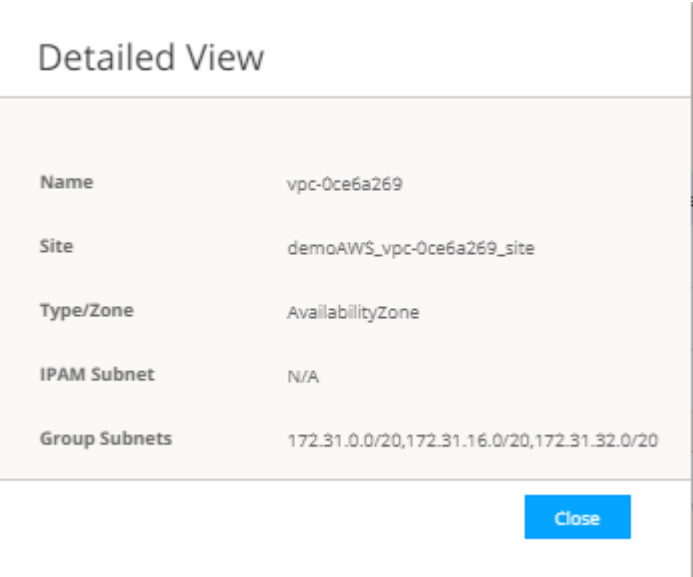

Table 298 on page 906 explains fields on the Detailed View page.

Table 298: Fields on the Detailed View Page

Field	Description
Name	Specifies name of a VPC or project.
Secure Fabric	Specifies the site to which the VPC or project s allocated.
Type/Zone	Specifies the connector type. For example, virtual network for Contrails and AvailabilityZone for AWS.
IPAM Subnet	Specifies the IP Address Management (IPAM) subnets allocated to the respective VPC or project.
Group Subnets	<p>Specifies the group of subnets allocated to the VPC or project.</p> <p>For Contrail, you will see a key value of Tier. For example, the group is called web and assigned subnet is x.x.x.x/xx. For AWS, you will see only the group of subnets.</p> <p>For Contrail, they are still group of subnets. However, each of the subnets are allocated to a tag, for example, database, tier, application, and so on.</p>

Integrating ForeScout CounterACT with Juniper Networks SDSN

IN THIS SECTION

- [Configuring the DEX Plug-in | 907](#)
- [Configuring the Web API Plug-in | 911](#)
- [Creating ForeScout CounterACT Connector in Security Director | 913](#)

This topic provides instructions on how to integrate the third-party device ForeScout CounterACT with Juniper Networks Software-Defined Secure Networks (SDSN) solution to remediate threats from infected hosts for enterprises. ForeScout CounterACT is an agentless security appliance that dynamically identifies and evaluates network endpoints and applications the instant they connect to your network. CounterACT applies an agentless approach and integrates with SDSN to block or quarantine infected hosts on Juniper Networks' devices, third-party switches, and wireless access controllers with or without 802.1x protocol integration.

To integrate ForeScout CounterACT with SDSN, you must create a connector in Policy Enforcer that enables CounterACT to connect to your secure fabric and create policies for CounterACT. Before you configure the ForeScout CounterACT connector, you must ensure that ForeScout CounterACT is installed and running with the Open Integration Module (OIM). The ForeScout OIM consists of two plug-ins: Data Exchange (DEX) and Web API. Install both the plug-ins and ensure that they are running. You must configure these plug-ins before you create a connector in Policy Enforcer.

If you do not have ForeScout CounterACT installed in your network, obtain an evaluation copy from [here](#).

This topic includes the following sections:

Configuring the DEX Plug-in

The DEX plug-in receives API information about infected hosts from the ForeScout CounterACT connector. Messages from infected hosts are either blocked or quarantined.

When you configure the DEX plug-in, you also configure a new property, Test, for DEX. When configured, this property ensures that Web services are available for Policy Enforcer, monitors the network status, and validates usernames and passwords.

To configure the DEX plug-in:

1. Select **Tools > Options > Data Exchange (DEX)** in the CounterACT UI.

The Data Exchange configuration page appears.

2. On the Data Exchange (DEX) page, select the **CounterACT Web Services > Accounts** tab, as shown in [Figure 98 on page 908](#).

The DEX Accounts page appears.

Figure 98: DEX Accounts Page

Data Exchange (DEX)

Use DEX to exchange data with external sources.

3. Select **Add**.

The Add page appears.

4. In the Name field, enter the name for the CounterACT Web service account.

Enter this name in the DEX User Role field (see [Step 3](#)) while configuring the ForeScout connector in Security Director.

5. In the Description field, enter a brief description of the purpose of the Web service account.

6. In the Username field, enter the username that will be used to authorize CounterACT to access the Web service account.

7. In the Password field, enter the password that will be used to authorize CounterACT to access this Web service account.
8. Click **OK**.
9. In the Properties tab, click **Add**.

The General pane of the Add Property from CounterACT Web Service wizard opens, as shown in [Figure 99 on page 909](#).

Figure 99: Add Property-General Pane Page

The screenshot shows a wizard window titled "Add Property from CounterACT Web Service". On the left, there is a sidebar with a "General" tab selected, indicated by a thumbs-up icon. The main area is titled "General" and contains the following text: "Define a host property that is set via the CounterACT Web Service. Associate the property with a CounterACT web service account. Only requests submitted to the web service using this account can set the property." Below this text are four input fields: "Property Name" (a single-line text box), "Property Tag (ASCII only)" (a single-line text box), "Description" (a multi-line text area), and "Account" (a dropdown menu with a downward arrow). At the bottom right of the window, there are five buttons: "Help" (blue), "Previous" (disabled, light gray), "Next" (blue), "Finish" (disabled, light gray), and "Cancel" (blue).

10. Add properties such as block, quarantine, and Test, as shown in [Figure 100 on page 910](#).

You must include the Test property. Otherwise, you cannot add CounterACT as a third-party connector to Policy Enforcer successfully.

Figure 100: DEX Properties Page

11. In the Security Settings tab, click **Add** and add the IP address range from where communication is expected, as shown in [Figure 101 on page 910](#).

? Help Apply Cancel

12. On the Data Exchange (DEX) page, click **Apply**.

The configuration is saved and the configuration settings are applied.

Configuring the Web API Plug-in

The Web API plug-in enables external entities to communicate with CounterACT by using simple, yet powerful Web service requests based on HTTP interaction. You configure the Web API plug-in to create an account for Policy Enforcer integration.

To configure the Web API plug-in:

1. Select **Tools > Options > Web API** in the CounterACT UI.

The Web API page appears.

2. In the User Settings tab, select **Add**.

The Add Credentials page appears.

3. Use the same username and password that you created for the DEX configuration (see Step 6 and Step 7) and click **OK**, as shown in [Figure 103 on page 912](#).

Figure 103: Web API User Settings Page

4. Select the **Client IPs** tab and click **Add**.

Add the Policy Enforcer IP address into the access list.

5. Click **OK**.

The IP address appears in the IP Address Range list, as shown in [Figure 104 on page 913](#).

Figure 104: Web API Client IPs Page

6. Click **Apply** to save and apply your configuration.

Creating ForeScout CounterACT Connector in Security Director

After you configure the DEX and Web API plug-ins, you need to create a connector for ForeScout CounterACT in Policy Enforcer.

To create a ForeScout CounterACT connector in Junos Space Security Director:

1. Select **Security Director > Administration > Policy Enforcer > Connectors**.

The Connectors page appears.

2. Click the create icon (+).

The Create Connector page appears.

3. In the General tab, select ForeScout CounterACT as the connector type and provide the username, DEX user role, and password, as shown in [Figure 105 on page 914](#). (The DEX user role is the one that you created in Step 4).

Specify 443 as the port number for communication.

Figure 105: Edit Connector Page

4. In the Network Details tab, configure the IP subnets, as shown in [Figure 106 on page 914](#). CounterACT treats the IP subnets as endpoints and takes action.

Figure 106: Edit Connector - Network Details Page

5. In the Configuration tab, specify the Web API username and password, as shown in [Figure 107 on page 915](#).

Figure 107: ForeScout Connector - Configuration Tab

Edit Connector ?

1 General 2 Network Details 3 **Configuration**

Configuration

Configuration

Enter configuration values for the configuration keys.

Configuration Key	Configuration Value
User ID of CounterACT web application	admin
Password of CounterACT web application	****

Cancel Back Finish

6. Click **Finish**.

A new ForeScout CounterACT connector is created.

7. Verify that the communication between Policy Enforcer and CounterACT is working.

After installing ForeScout CounterACT and configuring a connector, in the CounterACT UI, create policies for CounterACT to take the necessary action on the infected hosts. The Hosts page lists compromised hosts and their associated threat levels, as shown in [Figure 108 on page 916](#).

Figure 108: Host Information

Table 299 on page 916 shows the recommended actions performed by CounterACT on the infected hosts that are blocked or quarantined.

Table 299: Recommended Action to Be Performed on the Infected Hosts

Infected Host Policy Enforcer Action	Connection State	Action Performed by CounterACT
Blocked	Wired	Apply access control list (ACL) to block inbound and outbound traffic for a specific MAC address.
	Wireless	Apply WLAN block on the endpoint, which will block the traffic based on the wireless MAC address.
	Dot1x	Apply CoA.
Quarantined	Wired	Apply VLAN. This action is specified by Policy Enforcer.
	Wireless	Apply VLAN. This action is specified by Policy Enforcer.

RELATED DOCUMENTATION

ClearPass Configuration for Third-Party Plug-in

Policy Enforcer's ClearPass Connector communicates with the Clearpass Radius server using the Clearpass API. As part of threat remediation, Policy Enforcer's Clearpass Connector uses enforcement profiles. This section provides information for configuring Clearpass so that Policy Enforcer can invoke the appropriate enforcement profiles.

As part of the configuration, on ClearPass you will create two enforcement profiles, one for quarantine and one for terminate. Then you will use them in the ClearPass enforcement policy. Once ClearPass is configured, you will configure a ClearPass Connector on Policy Enforcer.

NOTE:

- Always use a third-party switch that supports 802.1x, Radius CoA, Radius Accounting, and DHCP snooping features. Enabling DHCP snooping is important which configures the Radius attribute, Framed-IP-Address. Only after configuring Framed-IP-Address, Policy Enforcer can detect the session related to the infected-host IP addresses and terminate the session.
- The stale sessions in ClearPass cannot be terminated and therefore, the actual East-West traffic block will not be active until you reauthenticate the session. You must ensure to clear the stale sessions in ClearPass frequently.

On ClearPass you will configure the following:

- API Client
- Custom Attribute
- Enforcement Profiles
- Enforcement Policy

To configure the API Client:

1. In ClearPass, navigate to **Administration > API Services > API Clients** and create a client with the following attributes:

NOTE: You must login as ClearPass Guest to see the API services menu.

- Client ID: sdsnclient
- Enabled: Select the check box for **Enable API client**

- Operator Profile: Create a profile from Administrator > Operator Logins > Profiles for the API client with minimum access privileges as shown in [Figure 109 on page 918](#).

Figure 109: ClearPass API Client Operator Profile Minimum Privileges

Operator Profile	
Name:	sdsnop
Description:	
Operator logins:	Enabled
Privileges:	<div>  API Services Custom </div> <div>  Allow API Access  Allow Access </div> <div>  Guest Manager Custom </div> <div>  Active Sessions  Full Access </div> <div>  Active Sessions History  Read Only </div> <div>  Policy Manager Custom </div> <div>  Identity - Endpoints  Read and Write </div> <div>  Insight - Endpoints  Read and Write </div>
Skin:	
Start Page:	(Default)
Language:	(Default)
Time Zone:	(GMT-08:00) America/Los Angeles; Pacific Time

- Grant Type: Select **Client credentials** (`grant_type = client_credentials`)
- Client Secret: Copy and save this. It will not be shown again.
- Access Token Lifetime: Enter 5 minutes as a time-frame.

Figure 110: ClearPass Edit API Client

ClearPass Guest

Home » Administration » API Services » API Clients

Edit API Client (sdsncient)

Use this form to edit the API client 'sdsncient'.

 Changing properties other than the description will invalidate any existing access tokens.

Edit API Client	
* Client ID:	<input type="text" value="sdsncient"/> <small>The unique string identifying this API client. Use this value in the OAuth2 "client_id" parameter.</small>
Description:	<div style="border: 1px solid #ccc; height: 30px; width: 100%;"></div> <small>Use this field to store comments or notes about this API client.</small>
Enabled:	<input checked="" type="checkbox"/> Enable API client
* Operator Profile:	<input type="text" value="sdsnop"/>  <small>The operator profile applies role-based access control to authorized OAuth2 clients. This determines what API objects and methods are available for use.</small>
* Grant Type:	<input type="text" value="Client credentials (grant_type=client_credentials)"/>  <small>Only the selected authentication method will be permitted for use with this client ID.</small>
Client Secret:	 <i>Encrypted, not shown</i> <input type="checkbox"/> Generate a new client secret
Access Token Lifetime:	<input type="text" value="5"/>  minutes <small>Specify the lifetime of an OAuth2 access token.</small>
<div style="display: flex; justify-content: space-around; margin-top: 10px;"> <div style="background-color: #003366; color: white; padding: 5px 15px; border-radius: 3px;"> Save Changes</div> <div style="background-color: #003366; color: white; padding: 5px 15px; border-radius: 3px;"> Cancel</div> </div>	

* required field

2. Click **Save Changes**.

To configure a Custom Attribute:

1. Select ClearPass Policy Manager and navigate to **Administration > Dictionaries > Attributes** to create a custom attribute. Then add it into the Dictionary: sdsnEpStatus. Enter the following:
 - Entity Type: **Endpoint**
 - Name: sdsnEpStatus (Note that you must use this name - sdsnEpStatus)
 - Data Type: **List**
 - Is Mandatory: **Yes**
 - Allowed Values: **healthy, blocked, quarantine**
 - Default Value: **healthy**

Figure 111: ClearPass Edit Attribute

Administration » Dictionaries » Attributes

Attributes

Filter: contains

#	<input type="checkbox"/> Name ▲	Entity	Data Type
1.	<input type="checkbox"/> sdsnEpStatus	Endpoint	List

Showing 1-1 of 1

Edit Attribute

Entity	EndPoint	
Name	<input type="text" value="sdsnEpStatus"/>	
Data Type	List	
Is Mandatory	Yes	
Allowed Value	<input type="text" value="healthy, blocked, quarantine"/> (e.g., example1,example2,example3)	
Default Value (optional)	<input type="text" value="healthy"/> Select from the list	

2. Click **Save**.

To configure Enforcement Profiles:

1. In ClearPass, navigate to **Configuration > Enforcement > Profiles** and create two enforcement profiles.
2. Profile 1: Create the following profile to quarantine infected endpoints:
 - Name: **JNPR SDSN Quarantine**
 - Description: **Quarantine profile for SDSN**
 - Type: **RADIUS**
 - Action: **Accept**

Figure 112: ClearPass Enforcement Profile: Quarantine

Type:	RADIUS
Action:	Accept
Device Group List:	-

Attributes:

Type	Name	Value
1. Radius:IETF	Tunnel-Private-Group-Id	= v100
2. Radius:IETF	Tunnel-Type	= VLAN (13)
3. Radius:IETF	Tunnel-Medium-Type	= IEEE-802 (6)
4. Radius:IETF	Acct-Interim-Interval	= 60

[Back to Enforcement Profiles](#) Copy Save Cancel

NOTE: The data displayed at the bottom of the screen is for example and not for configuration purposes. Note that the 4th attribute can be set for the accounting packets to be sent by the NAS device to the Clearpass Radius server.

3. Profile 2: Create the following profile to block infected endpoints:

NOTE: To configure this profile, copy the default system profile Juniper Terminate Session and edit the profile name and attributes.

- Name: **JNPR SDSN Terminate Session**
- Description: **Block profile for SDSN**
- Type: **RADIUS_CoA**
- Action: **Disconnect**

NOTE: If there are any vendor-specific additional attributes required for the Terminate COA, those needs to be added here. For example, in the case of Juniper Networks Trapeze Wireless Clients, the JNPR SDSN Terminate Session profile requires two additional attributes: NAS-IP-Address and User-Name.

NOTE: Rules Evaluation should be set to "First applicable."

NOTE: Make sure the default termination enforcement profile for each of the supported vendors is not superseded by any of its enforcement profile copies. Also make sure that all the attributes required for termination are set in the profile. (As in the previous Juniper Networks Trapeze Wireless Clients example.)

Enable Insight:

1. In ClearPass, navigate to **Administration** > **Server Manager** > **Server Configuration** for the server in use.
2. Enable Insight in the **System** tab.

Set the Log accounting Interim-update Packets as TRUE:

1. In ClearPass, navigate to **Administration** > **Server Manager** > **Server Configuration** for the server in use.
2. Select the **Service Parameters** tab.

3. In the **Select Service** drop down list, select **Radius Server** and set the Log accounting Interim-update Packets as **TRUE**.
4. Proceed to [“Creating a Policy Enforcer Connector for Third-Party Switches” on page 898](#) to finish the configuration with Policy Enforcer.

RELATED DOCUMENTATION

[Creating a Policy Enforcer Connector for Third-Party Switches | 898](#)

[Policy Enforcer Connector Overview | 887](#)

Cisco ISE Configuration for Third-Party Plug-in

Policy Enforcer's Cisco ISE Connector communicates with the Cisco Identity Services Engine server using the Cisco ISE API. As part of threat remediation, Policy Enforcer's Connector uses enforcement profiles. This section provides information for configuring Cisco ISE so that Policy Enforcer can invoke the appropriate enforcement profiles.

As part of the configuration, on Cisco ISE you will create two enforcement profiles, one for quarantine and one for terminate. Then you will use them in the Cisco ISE enforcement policy. Once Cisco ISE is configured, you will configure a Cisco ISE Connector on Policy Enforcer.

NOTE: Always use a third-party switch that supports 802.1x, Radius CoA, Radius Accounting, and DHCP snooping features. Enabling DHCP snooping is important which configures the Radius attribute, Framed-IP-Address. Only after configuring Framed-IP-Address, Policy Enforcer can detect the session related to the infected-host IP addresses and terminate the session.

On Cisco ISE you will configure the following:

- Change policy modes
- Create an API client
- Configure network profiles
- Add a custom attribute
- Configure authorization profiles
- Set an authorization policy

On Cisco ISE, the Simple Mode policy model is selected by default. For creating an API client, Policy Sets should be enabled.

- Navigate to **Administration > System > Settings > Policy Sets** and Enable **Policy Sets** mode.

You are prompted to login again after changing the mode.

Figure 115: Cisco ISE: Enable Policy Sets Mode

Create an API Client:

1. Using the Cisco ISE web UI, create an Admin User by navigating to **Administration > System > Admin Access > Administrator > Admin User**.
2. Create an Admin User and assign it to the following Admin Groups: **ERS Admin, MnT Admin**.

Make note of the username and password. You will need them when you configure the connector portion in Policy Enforcer later on.

Figure 116: Cisco ISE: Create Admin User and Assign to Admin Groups

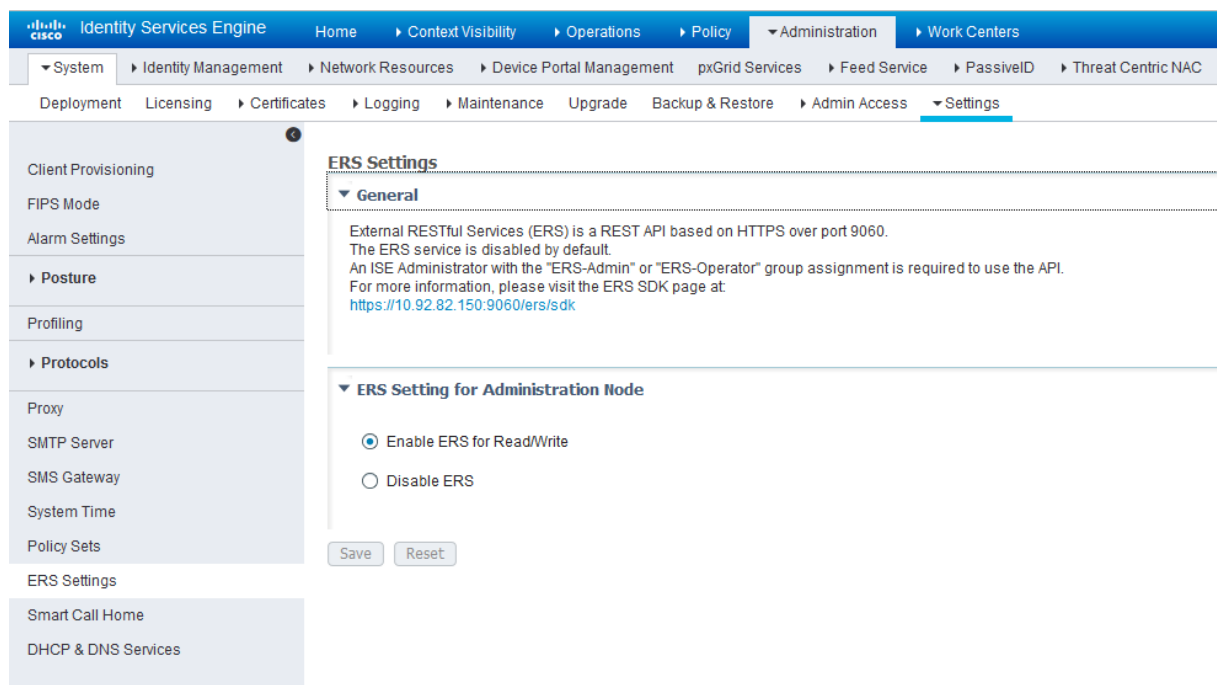

Enable the External RESTful Services API (ERS) for the Administration Node:

1. Navigate to **Administration > System > Settings > ERS Settings** and select **Enable ERS for Read/Write**.

2. Click **Save**.

Figure 117: Cisco ISE: Enable ERS

Configure network profiles:

Devices managed by ISE must support RADIUS CoA and have the proper network profiles assigned to handle the CoA commands sent by the ISE server:

1. Navigate to **Administration > Network Resources > Network Device Profiles** and verify the existing network device profile list.

If you are creating a new profile, proceed to the next step for information.

Figure 118: Cisco ISE: Network Device Profiles List

Name	Description	Vendor	Source
AlcatelWired	Profile for Alcatel switches	Alcatel	Cisco Provided
ArubaWireless	Profile for Aruba wireless network access devices	Aruba	Cisco Provided
BrocadeWired	Profile for Brocade switches	Brocade	Cisco Provided
Cisco	Generic profile for Cisco network access devices	Cisco	Cisco Provided
Prad		Cisco	User Defined
HPWired	Profile for HP switches	HP	Cisco Provided
HPWired_SNMP_CoA	Profile for HP switches with no RADIUS CoA	HP	Cisco Provided
HPWireless	Profile for HP wireless network access devices	HP	Cisco Provided
Juniper	Profile for Juniper Switches - created by Binh.	Juniper	User Defined
MotorolaWireless	Profile for Motorola wireless network access devices	Motorola	Cisco Provided
RuckusWireless	Profile for Ruckus wireless network access devices	Ruckus	Cisco Provided

2. If you are configuring a new profile, you must minimally set the following:
- Enable RADIUS and add a corresponding dictionary in the supported protocol list.

Figure 119: Cisco ISE: Network Device Profile, Enable RADIUS

Configure a custom attribute.

1. Navigate to **Administration > Identity Management > Settings > Endpoint Custom Attribute** and add attribute **sdsnEpStatus** with type string.

Figure 122: Cisco ISE: Add Attribute sdsnEpStatus

The screenshot displays the Cisco ISE Administration interface. The top navigation bar includes 'Home', 'Context Visibility', 'Operations', 'Policy', 'Administration', and 'Work Centers'. The 'Administration' tab is active, and the left sidebar shows the navigation menu with 'Endpoint Custom Attributes' selected. The main content area is titled 'Endpoint Custom Attributes' and contains a table of reference attributes and a form to add a new custom attribute.

Required	Attribute Name	Data Type
	PostureApplicable	STRING
	LogicalProfile	STRING
	EndPointPolicy	STRING
	OperatingSystem	STRING
	BYODRegistration	STRING
	PortalUser	STRING
	LastAUPAcceptanceHours	INT

Below the table, the 'Endpoint Custom Attributes' section contains a form with the following fields:

- Attribute name:** A text input field containing 'sdsnEpStatus'.
- Type:** A dropdown menu set to 'String'.
- Buttons:** 'Reset' and 'Save' buttons.

2. Verify the attribute under **Policy > Policy Elements > Dictionaries > System > Endpoints**.

Figure 123: Cisco ISE: Verify Attribute

The screenshot shows the Cisco ISE web interface. The top navigation bar includes 'Identity Services Engine' and tabs for 'Home', 'Context Visibility', 'Operations', 'Policy', 'Administration', and 'Work Centers'. The 'Policy' tab is active, and the 'Policy Elements' sub-tab is selected. The left sidebar shows a tree view of 'Dictionaries' with 'System' expanded, and 'EndPoints' selected. The main content area displays 'Dictionary Attributes' for 'EndPoints'. It includes a search bar and a table with columns: Name, Internal Name, and Description.

Name	Internal Name	Description
<input type="checkbox"/> BYODRegistration	BYODRegistration	BYODRegistration
<input type="checkbox"/> EndPointPolicy	EndPointPolicy	EndPointPolicy
<input type="checkbox"/> LastAUPAcceptanceHo...	LastAUPAcceptanceHo...	LastAUPAcceptanceHours
<input type="checkbox"/> LogicalProfile	LogicalProfile	LogicalProfile
<input type="checkbox"/> OperatingSystem	OperatingSystem	OperatingSystem
<input type="checkbox"/> PortalUser	PortalUser	PortalUser
<input type="checkbox"/> PostureApplicable	PostureApplicable	PostureApplicable
<input type="checkbox"/> sdsEpStatus	sdsEpStatus	sdsEpStatus

3. Navigate to **Policy > Policy Elements > Conditions > Authorization > Simple Conditions**. Add there authorization simple conditions using the **sdsEpStatus** attribute you created.

In the screen below,, there are three conditions created using sdsEpStatus attribute. The condition names do not need to be the same as in the screen here, but the expressions must be matched. These conditions will be used in Policy Sets to handle the threat remediation for managed endpoints as described later in the Policy Sets setting section. Only the sdsEpStatus-blocked and sdsEpStatus-quarantine conditions will be used there. sdsEpStatus-healthy is created for fulfillment purpose and can be ignored for now.

Figure 124: Cisco ISE: Configure Simple Conditions, Match Expression

The screenshot shows the Cisco Identity Services Engine (ISE) interface. The top navigation bar includes 'Home', 'Context Visibility', 'Operations', 'Policy', 'Administration', and 'Work Centers'. The 'Policy' tab is active, and the left sidebar shows 'Policy Elements' expanded, with 'Conditions' selected. The main content area is titled 'Authorization Simple Condition List > sdsnEpStatus-blocked'. Below this, the 'Authorization Simple Conditions' section contains a form for configuring a new condition. The form fields are: '* Name' (sdsnEpStatus-blocked), 'Description' (sdsnEpStatus is blocked), '* Attribute' (EndPoints:sdsnEpStatus), '* Operator' (Equals), and '* Value' (blocked). There are 'Save' and 'Reset' buttons at the bottom of the form.

Figure 125: Cisco ISE: Configure Simple Conditions, Match Expression

The screenshot shows the Cisco Identity Services Engine (ISE) interface. The top navigation bar includes 'Home', 'Context Visibility', 'Operations', 'Policy', 'Administration', and 'Work Centers'. The 'Policy' tab is active, and the left sidebar shows 'Policy Elements' expanded, with 'Conditions' selected. The main content area is titled 'Authorization Simple Condition List > sdsnEpStatus-quarantine'. Below this, the 'Authorization Simple Conditions' section contains a form for configuring a new condition. The form fields are: '* Name' (sdsnEpStatus-quarantine), 'Description' (sdsnEpStatus is quarantine), '* Attribute' (EndPoints:sdsnEpStatus), '* Operator' (Equals), and '* Value' (quarantine). There are 'Save' and 'Reset' buttons at the bottom of the form.

Configure permission/authorization profiles.

You can create the authorization profiles corresponding to “block” and “quarantine” actions as fits your needs. In the sample configuration provided here, the block action will result as total denial access to the network, and the quarantine profile will move the endpoint to another designated VLAN.

- 1. Navigate to From **Policy > Policy Elements > Results > Authorization > Authorization Profiles**.
Refer to the figures below for sample configurations.

Figure 126: Cisco ISE: Configure Authorization Profiles

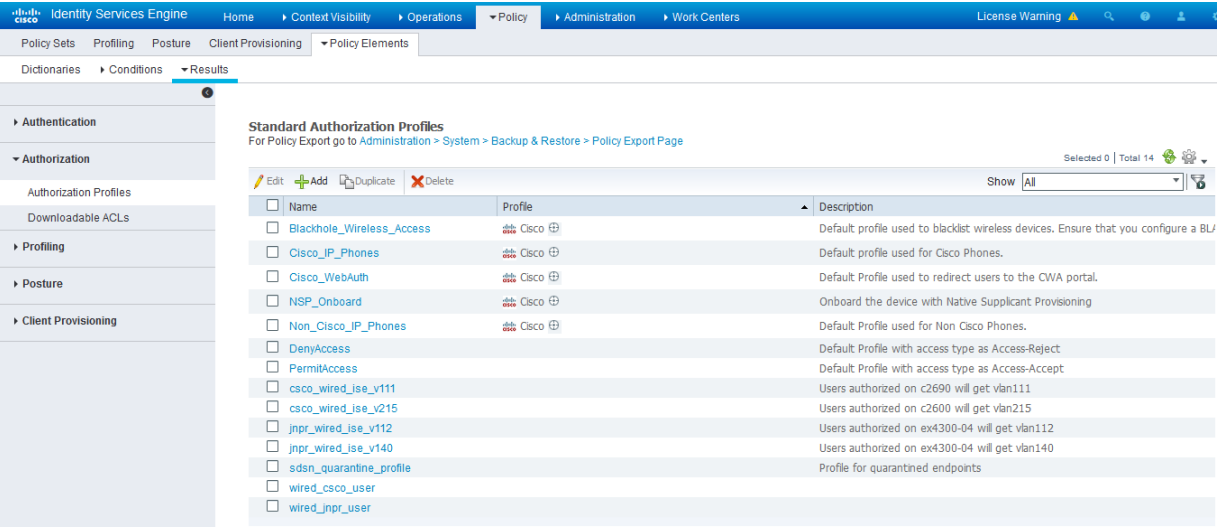

Figure 127: Cisco ISE: Configure Authorization Profiles

The screenshot shows the Cisco Identity Services Engine (ISE) configuration interface. The top navigation bar includes links for Home, Context Visibility, Operations, Policy, Administration, and Work Centers. The left sidebar shows a tree view with categories like Authentication, Authorization, Profiling, Posture, and Client Provisioning. The main content area is titled 'Authorization Profiles > sdsn_quarantine_profile' and contains the following configuration fields:

- Authorization Profile**
 - * Name: sdsn_quarantine_profile
 - Description: Profile for quarantined endpoints
 - * Access Type: ACCESS_ACCEPT
 - Network Device Profile: Any
 - Service Template: ☐
 - Track Movement: ☐ (i)
 - Passive Identity Tracking: ☐ (i)
- Common Tasks**
 - ☐ ACL
 - ☐ VLAN
- Advanced Attributes Settings**

Radius:Acct-Interim-Interval	=	60		
Radius:Tunnel-Medium-Type	=	802	Tag ID 1	Edit Tag
Radius:Tunnel-Private-Group-ID	=	200	Tag ID 1	Edit Tag
Radius:Tunnel-Type	=	VLAN	Tag ID 1	Edit Tag

NOTE: For blocking a host, the default 'DenyAccess' profile is used.

Set the authorization policy:

1. Create two rules as Local Exceptions, applying the conditions and authorization/permission profiles we created in the previous step. Names may be different, but these two rules must be at the top of the Exception list.

Refer to the figure below for a sample configuration.

Figure 128: Cisco ISE: Local Exception Rules, Example

NOTE: Find this under **Policy > Policy Sets > Authorization Policy**.

- 2. Proceed to “Creating a Policy Enforcer Connector for Third-Party Switches” on page 898 to finish the configuration with Policy Enforcer.

Guided Setup-Sky ATP with SDSN

IN THIS CHAPTER

- [Using Guided Setup for Sky ATP with SDSN | 937](#)

Using Guided Setup for Sky ATP with SDSN

Guided Setup is the most efficient way to complete your initial configuration. Locate Guided Setup from the **Configuration > Guided Setup > Threat Prevention** menu.

- The Sky ATP Configuration type you select on the Policy Enforcer Settings page determines the guided setup process. Guided setup provides all the configuration items you need for your chosen type. See [“Sky ATP Configuration Type Overview” on page 850](#) for details on each configuration type.
- Before you begin the guided setup process, you must enter the IP address and login credentials for the policy enforcer virtual machine on the Policy Enforcer Settings page. If you haven’t yet done that, go to **Administration > Policy Enforcer > Settings** and enter the necessary information. See [“Policy Enforcer Settings” on page 884](#) for more information.
- A Sky ATP license and account are needed for all Sky ATP Configuration Types. (Sky ATP with SDSN, Sky ATP, and Cloud Feeds only). If you do not have a Sky ATP license, contact your local sales office or Juniper Networks partner to place an order for a Sky ATP premium or basic license. If you do not have a Sky ATP account, when you configure Sky ATP, you are redirected to the Sky ATP server to create one. Please obtain a license before you try to create a Sky ATP account. Refer to [“Obtaining a Sky ATP License” on page 878](#) for instructions on obtaining a Sky ATP license.
- There are some concepts you should understand before you begin the configuration. It is recommended you read about them here in advance. [“Policy Enforcer Configuration Concepts” on page 849](#).

The Guided Setup process offers five steps for configuring Sky ATP with SDSN threat prevention. Click **Start Setup** to begin.

1. **Secure Fabric**—Secure Fabric is a collection of network devices (switches, routers, firewalls, and other security devices), used by users or user groups, to which policies for aggregated threat prevention are applied. Once created, secure fabric is located under Devices. For secure fabric, the following is configured:

- **Sites**—A site is a collection of network devices participating in threat prevention. Using quick setup, you can create your own site, but note that a device can only belong to one site and you must remove it from the any other site where it is used to use it elsewhere.

Click **Add Devices** in the Device Name column or in the IP address column to add devices to a site. Using the check boxes in the device list, you should indicate which devices are firewalls or switches. Policy Enforcer needs to know which devices are firewalls so they can be enrolled in Sky ATP realms and receive feed downloads.

NOTE: Firewall devices are automatically enrolled with Sky ATP as part of this step. No manual enrollment is required.

2. **Policy Enforcement Group**—A policy enforcement group is a grouping of endpoints ready to receive

advance threat prevention policies. Create a policy enforcement group by adding endpoints (firewalls and switches) under one common group name and later applying a security policy to that group. For policy enforcement group, the following is configured:

- Once configured, policy enforcement groups are located under **Configure > Shared Objects**. A policy enforcement groups has the following fields:
 - **Name** and **Description**.
 - **Group Type**—IP Address, Subnet, or Location
 - **Endpoint**—IP addresses included in the group

3. **Sky ATP Realm**— If you have not created a realm from within your Sky ATP account, you can create and register it here by clicking the + sign. Once you register a realm, you can enroll SRX Series devices into the realm. A security realm is a group identifier for an organization used to restrict access to Web applications. You can create one or multiple realms. A realm has the following configuration fields

- **Username** and **Password**—These are credentials you must provide, obtained through your Sky ATP account.
- **Realm**—This is the name of the realm you are creating.

If a realm is already created with a site assigned, all devices in a site are listed under the Devices in Site(s) column that includes EX Series, SRX Series, all enforcement points and devices that are originally from a realm . Devices that are marked as perimeter firewall devices are listed under the Perimeter Firewall column.

4. **Threat Prevention Policy**—A threat prevention policy requires you to create a name for the policy, choose one or more profile types depending on the type of threat prevention this policy provides (C&C Server, Infected Host, Malware), and select a log setting. Once configured, you apply policies to policy enforcement groups.

- Once configured, threat prevention policies are located under **Configure > Threat Prevention > Policies**. A policy has the following fields:
 - **Name** and **Description**.
 - **Profiles**—The type of threat this policy manages:
 - **C&C Server** (Command and Control Server)—A C&C server is a centralized computer that issues commands to botnets (compromised networks of computers) and receives reports back from them. A C&C profile would provide information on C&C servers that have attempted to contact and compromise hosts on your network. Information such as IP address, threat level, and country of origin are gathered.
 - **Infected Host**—An infected host profile would provide information on compromised hosts and their associated threat levels. Host information includes IP address, threat level, blocked status, when the threat was seen, command and control hits, and malware detections.

- **Malware**—A malware profile would provide information on files downloaded by hosts and found to be suspicious based on known signatures or URLs. The filename, file type, signature, date and time of download, download host, URL, and file verdict are gathered.
 - **Logging**—All traffic is logged by default. Use the pulldown to narrow the types of traffic to be logged.
 - **Group**—Once your policy is created, it is applied to the policy enforcement group.
5. **Geo IP**—Geo IP refers to the method of locating a computer terminal's geographic location by identifying that terminal's IP address. A Geo IP feed is an up-to-date mapping of IP addresses to geographical regions. By mapping IP address to the sources of attack traffic, geographic regions of origin can be determined, giving you the ability to filter traffic to and from specific locations in the world. For Geo IP, you configure the following:
 - **Name and Description**
 - **Countries**—Select the check box beside the countries in the Available list and click the > icon to move them to the Selected list. The countries in the Selected list will be included in the policy and action will be taken according to their threat level.
 - **Block Traffic**—Choose what traffic to block from the selected countries. Incoming traffic, Outgoing traffic, or Incoming and Outgoing traffic.
 6. The last page is a summary of the items you have configured using quick setup. Click **OK** to be taken to the Policies page under **Configure > Threat Prevention > Policies** and your policy is listed there.
 7. You must update to apply your new or edited policy configuration. Clicking the **Ready to Update** link takes you the Threat Policy Analysis page. See [“Threat Policy Analysis Overview” on page 679](#). From there you can view your changes and choose to Update now, Update later, or Save them in draft form without updating.

[Using Guided Setup for Sky ATP | 940](#)

Guided Setup-Sky ATP

IN THIS CHAPTER

- [Using Guided Setup for Sky ATP | 940](#)

Using Guided Setup for Sky ATP

Guided Setup is the most efficient way to complete your initial configuration. Locate Guided Setup from the **Configuration > Guided Setup > Threat Prevention** menu.

- The Sky ATP Configuration type you select on the Policy Enforcer Settings page determines the guided setup process. Guided setup provides all the configuration items you need for your chosen type. See [“Sky ATP Configuration Type Overview” on page 850](#) for details on each configuration type.
- Before you begin the guided setup process, you must enter the IP address and login credentials for the policy enforcer virtual machine on the Policy Enforcer Settings page. If you haven't yet done that, go to **Administration > Policy Enforcer > Settings** and enter the necessary information. See [“Policy Enforcer Settings” on page 884](#) for more information.
- A Sky ATP license and account are needed for all Sky ATP Configuration Types. (Sky ATP with SDSN, Sky ATP, and Cloud Feeds only). If you do not have a Sky ATP license, contact your local sales office or Juniper Networks partner to place an order for a Sky ATP premium or basic license. If you do not have a Sky ATP account, when you configure Sky ATP, you are redirected to the Sky ATP server to create one. Please obtain a license before you try to create a Sky ATP account. Refer to [“Obtaining a Sky ATP License” on page 878](#) for instructions on obtaining a Sky ATP license.
- There are some concepts you should understand before you begin the configuration. Read [“Sky ATP Overview” on page 841](#) for further information.

Click **Start Setup** from **Configuration > Guided Setup > Threat Prevention** to begin.

1. **Add a Sky ATP Realm**—If you have not created a realm from within your Sky ATP account, you can create it here by clicking the + sign. Once you add a realm, you can enroll SRX Series devices into the realm. A security realm is a group identifier for an organization used to restrict access to Web applications. You can create one or multiple realms. See [“Sky ATP Realm Overview” on page 691](#) for information. A realm has the following configuration fields
 - **Username and Password**—These are credentials you must provide, obtained through your Sky ATP account.
 - **Realm**—This is the name of the realm you are creating.
2. Click **Add devices** to enroll them in threat prevention before proceeding to the next step. Devices designated as perimeter firewalls are automatically enrolled with Sky ATP.
3. **Create a Policy**—You create a name for the policy, choose one or more profile types depending on the type of threat prevention this policy provides (C&C Server, Infected Host, Malware), and select a log setting.
 - Once configured, threat prevention policies are located under **Configure > Threat Prevention > Policies**. A policy has the following fields:
 - **Name and Description**.
 - **Profiles**—The type of threat this policy manages:
 - **C&C Server** (Command and Control Server)—A C&C server is a centralized computer that issues commands to botnets (compromised networks of computers) and receives reports back from them. A C&C profile provides information on C&C servers that have attempted to contact and compromise hosts on your network. Information such as IP address, threat level, and country of origin are gathered.
 - **Infected Host**—An infected host profile provides information on compromised hosts and their associated threat levels. Host information includes IP address, threat level, blocked status, when the threat was seen, command and control hits, and malware detections.
 - **Malware**—A malware profile provides information on files downloaded by hosts and found to be suspicious based on known signatures or URLs. The filename, file type, signature, date and time of download, download host, URL, and file verdict are gathered.
 - **Logging**—All traffic is logged by default. Use the pulldown to narrow the types of traffic to be logged.
4. **Geo IP**—Geo IP refers to the method of locating a computer terminal's geographic location by identifying that terminal's IP address. A Geo IP feed is an up-to-date mapping of IP addresses to geographical regions. By mapping IP address to the sources of attack traffic, geographic regions of origin can be determined, giving you the ability to filter traffic to and from specific locations in the world. For Geo IP, you configure the following:
 - **Name and Description**

- **Countries**—Select the check box beside the countries in the Available list and click the > icon to move them to the Selected list. The countries in the Selected list will be included in the policy and action will be taken according to their threat level.
 - **Block Traffic**—Choose what traffic to block from the selected countries. Incoming traffic, Outgoing traffic, or Incoming and Outgoing traffic.
5. The last page is a summary of the items you have configured. Click **OK** to be taken to the Policies page under **Configure > Threat Prevention**, and your policy is listed there.

NOTE: When you are using Sky ATP without Policy Enforcer, you must assign the policy to a firewall rule before it can take affect. Navigate to **Configure > Firewall Policy > Policies**. In the Advanced Security column, click an existing item to access the Edit Advanced Security page and select the Threat Prevention Policy from the **Threat Prevention** pulldown list.

[Sky ATP Overview | 841](#)

[Sky ATP Realm Overview | 691](#)

[Configuring Sky ATP \(No SDSN and No Guided Setup\) Overview | 970](#)

[Creating Geo IP Policies | 765](#)

Guided Setup for No Sky ATP (No Selection)

IN THIS CHAPTER

- [Using Guided Setup for No Sky ATP \(No Selection\) | 944](#)

Using Guided Setup for No Sky ATP (No Selection)

Guided Setup is the most efficient way to complete your initial configuration. Locate Guided Setup from the **Configuration > Guided Setup > Threat Prevention** menu.

You would make no Sky ATP selection to configure SDSN using only custom feeds. Custom feeds are the only threat prevention type available if you make no selection for Sky ATP Configuration Type in the Policy Enforcer Settings page.

- Before you begin the guided setup process, you must enter the IP address and login credentials for the policy enforcer virtual machine on the Policy Enforcer Settings page. If you haven't yet done that, go to **Administration > Policy Enforcer > Settings** and enter the necessary information. See [“Policy Enforcer Settings” on page 884](#) for more information.
- There are some concepts you should understand before you begin the configuration. It is recommended you read about them here in advance. [“Policy Enforcer Configuration Concepts” on page 849](#).

The Guided Setup process offers four steps for configuring threat prevention with custom feeds (No Sky ATP selection). Click **Start Setup** to begin.

1. **Secure Fabric**—Secure Fabric is a collection of network devices (switches, routers, firewalls, and other security devices), used by users or user groups, to which policies for aggregated threat prevention are applied. Once created, secure fabric is located under Devices. For secure fabric, the following is configured:

- **Sites**—A site is a collection of network devices participating in threat prevention. Using quick setup, you can create your own site, but note that a device can only belong to one site and you must remove it from the any other site where it is used to use it elsewhere.

Click **Add Devices** in the Device Name column or in the IP address column to add devices to a site. Using the check boxes in the device list, you should indicate which devices are firewalls or switches.

2. **Policy Enforcement Group**—A policy enforcement group is a grouping of endpoints ready to receive advance threat prevention policies. Create a policy enforcement group by adding endpoints (firewalls and switches) under one common group name and later applying a security policy to that group. For policy enforcement group, the following is configured:

- Once configured, policy enforcement groups are located under **Configure > Shared Objects**. A policy enforcement groups has the following fields:
 - **Name and Description.**
 - **Group Type**—IP Address, Subnet, or Location
 - **Endpoint**—IP addresses included in the group

3. **Custom Feeds**— Policy Enforcer uses threat feeds to provide actionable intelligence to policies about various types of threats. These feeds can come from different sources. In this case, the feeds are customized by adding IP addresses, domains, and URLs to your own lists.

The following types of custom threat feeds are available:

- **Dynamic Address**—A dynamic address is a group of IP addresses that can be imported from external sources. These IP addresses are for specific domains or for entities that have a common attribute such as a particular undesired location that poses a threat. You can then configure security policies to use the dynamic addresses within a security policy.
 - **Whitelist**—A whitelist contains known trusted IP addresses, URLs, and domains. Content downloaded from locations on the whitelist does not have to be inspected for malware.
 - **Blacklist**—A blacklist contains known untrusted IP addresses, URLs, and domains. Access to locations on the blacklist is blocked, and therefore no content can be downloaded from those sites.
 - **Infected Host**—Infected hosts are hosts known to be compromised.
4. **Threat Prevention Policy**—A threat prevention policy requires you to create a name for the policy, choose one or more profile types depending on the type of threat prevention this policy provides (infected hosts), and select a log setting. Once configured, you apply policies to policy enforcement groups.
 - Once configured, threat prevention policies are located under **Configure > Threat Prevention > Policies**. A policy has the following fields:
 - **Name and Description**.
 - **Profiles**—The type of threat this policy manages:
 - **Infected Hosts**—An infected host profile would provide information on compromised hosts and their associated threat levels. Host information includes IP address, threat level, blocked status, when the threat was seen, command and control hits, and malware detections.
 - **Logging**—All traffic is logged by default. Use the pulldown to narrow the types of traffic to be logged.
 - **Group**—Once your policy is created, it is applied to the policy enforcement group.
 5. The last page is a summary of the items you have configured using quick setup. Click **OK** to be taken to the Policies page under **Configure > Threat Prevention > Policies** and your policy is listed there.
 6. You must update to apply your new or edited policy configuration. Clicking the **Ready to Update** link takes you the Threat Policy Analysis page. See [“Threat Policy Analysis Overview” on page 679](#). From there you can view your changes and choose to Update now, Update later, or Save them in draft form without updating.

Configuring Sky ATP with SDSN (Without Guided Setup) Overview

This is an outline of the tasks required to configure Sky ATP with SDSN.

NOTE: If you prefer to use quick setup, which automatically takes you through the steps listed below, it is located under **Configure>Guided Setup >Sky ATP with PE**.

- A Sky ATP license and account are needed for all threat prevention types (Sky ATP with PE, Sky ATP, and Cloud Feeds only). If you do not have a Sky ATP license, contact your local sales office or Juniper Networks partner to place an order for a Sky ATP premium or basic license. If you do not have a Sky ATP account, when you configure Sky ATP, you are redirected to the Sky ATP server to create one. Please obtain a license before you try to create a Sky ATP account. Refer to [“Obtaining a Sky ATP License” on page 878](#) for instructions on obtaining a Sky ATP license.
 - Before you configure Policy Enforcer, you must enter the IP address and login credentials for the policy enforcer virtual machine. Go to **Administration > Policy Enforcer > Settings**. Once this information is entered, you can begin the setup process. See [“Policy Enforcer Settings” on page 884](#). (Refer to [“Policy Enforcer Installation Overview” on page 857](#) for instructions on downloading Policy Enforcer and creating your policy enforcer virtual machine.)
1. Create one or more Sky ATP realms and enroll SRX Series devices in the appropriate realm. (Enroll devices by clicking **Add Devices** in the list view once the realm is created.)

In the UI, navigate to **Configure>Threat Prevention>Sky ATP Realms**. Click the + icon to add a new Sky ATP realm.

See [“Creating Sky ATP Realms and Enrolling Devices or Associating Sites” on page 692](#) for details.
 2. Create sites and add devices to those sites.

In the UI, navigate to **Devices >Secure Fabric**. Click the + icon to create a new site.

See [“Creating Secure Fabric and Sites” on page 304](#) for details.
 3. Create a policy enforcement group.

In the UI, navigate to **Configure>Shared Objects>Policy Enforcement Groups**. Click the + icon to create a new policy enforcement group.

See [“Creating Policy Enforcement Groups” on page 769](#) for details.
 4. Add the threat prevention policy, including profiles for one or more threat types: C&C server, infected host, malware.

In the UI, navigate to **Configure> Threat Prevention > Policies**. Click the + icon to create a new threat prevention policy.

See [“Creating Threat Prevention Policies” on page 671](#) for details.

Creating Sky ATP Realms and Enrolling Devices or Associating Sites

To access this page, click **Configure>Threat Prevention>Sky ATP Realms**.

You can create Sky ATP realms from the Sky ATP page.

- Understand which type of Sky ATP license you have: free, basic, or premium. The license controls which Sky ATP features are available.
- To configure a Sky ATP realm, you must already have a Sky ATP account with an associated license.
- Ensure that the internet connectivity is available for Policy Enforcer. Without the internet connectivity, you cannot create a realm.
- Decide which region will be covered by the realm you are creating. You must select a region when you configure a realm.
- Note that adding a device to a realm results in one or more commit operations occurring on the device to apply the Sky ATP or Policy Enforcer configuration.

To configure a Sky ATP Realm:

1. Select **Configure>Threat Prevention>Sky ATP Realms**.
2. Click the + icon.

3. Complete the initial configuration by using the guidelines in [Table 233 on page 693](#) below.

Table 300: Fields on the Add Sky ATP Realm Page

Field	Description
Location	<p>Select a region of the world from the available choices.</p> <p>The following options are available in the Location list:</p> <ul style="list-style-type: none"> • North America • European Region • Canada • Asia Pacific <p>By default, the North America value appears in the list. To know more about the geographic region, see here.</p>
Username	Enter your e-mail address. Your username for Sky ATP is your e-mail address.
Password	Enter a unique string at least 8 characters long. Include both uppercase and lowercase letters, at least one number, and at least one special character (~!@#\$%^&*()_+={}[] :;<>./?); no spaces are allowed, and you cannot use the same sequence of characters that are in your username.
Realm	<p>Enter a name for the security realm. This should be a name that is meaningful to your organization. A realm name can only contain alphanumeric characters and the dash symbol. Once created, this name cannot be changed.</p> <p>NOTE: When you create a custom feed with a realm, the feed is associated at the site level and not at the realm level. If you modify this realm and associate new sites to it, a warning message is shown that there are custom feeds are associated with this realm. Changing the site information will change the custom feed information. You must go and edit the custom feed that was associated with this realm and verify the realm association.</p>

4. Click **Next** and guided setup walks you through the steps for enrolling devices into the realm and associating sites for Policy Enforcer.

The next steps include the following:

5. If you are using Sky ATP with PE and you have no devices in enrolled in the realm, you are asked to select devices in the box on the left and move them to the right to enroll them. All selected devices are automatically enrolled with Sky ATP when you finish guided setup. To disenroll a device, you can edit a realm and move the device back to the left side box.

NOTE: Note that adding a device to a realm results in one or more commit operations occurring on the device to apply the Sky ATP or Policy Enforcer configuration.

6. Next you select a Site from the list to contain the devices. If there are no sites associated with the realm, click **Create new site**. See [“Creating Secure Fabric and Sites” on page 304](#).

NOTE: If you are using Sky ATP without PE, you are not prompted to select a site.

7. Once the devices and site are selected, you use the sidebar to choose a threshold level at which selected administrators are notified via email about infected host events. Click the+ sign if you want to add new administrators to the list.
8. Finally, you select one or more check boxes for event types you want to log.
9. Click **Finish**.

NOTE: If you enrolled a device into a realm from within Security Director and you want to disenroll it, you must do that from within Security Director. If you enrolled a device into a realm from within Sky ATP and you want to disenroll it, you must do that from within Sky ATP. You cannot disenroll a device from within Security Directory that was enrolled from within Sky ATP.

RELATED DOCUMENTATION

[Sky ATP Realm Overview](#) | 691

[Using Guided Setup for Sky ATP](#) | 940

[Creating Secure Fabric and Sites](#) | 304

Secure Fabric Overview

Secure Fabric is a collection of sites which contain network devices (switches, routers, firewalls, and other security devices), used in policy enforcement groups. When threat prevention policies are applied to policy

enforcement groups, the system automatically discovers to which sites those groups belong. This is how threat prevention is aggregated across your secure fabric.

- **Add Enforcement Points**—Click the **Add Enforcement Points** link to add Firewalls, Switches, and/or Connectors. There is a one-to-one mapping between devices with sites. If a device is mapped to a site, you cannot use the same device to map to a different site. The connector can be mapped to multiple sites. To filter by type, click the three vertical dots beside the search field and select the check box for the device type. See [“Creating Secure Fabric and Sites” on page 304](#) for more information.
- **Drag and Drop Enforcement Points**—From the main page, you can select enforcement points and drag them to other sites to include them there. When you drag, the enforcement point is disenrolled from the current site and gets enrolled to the new site where the enforcement point is dropped.

You can either have switches or a connector as enforcement points and not both. However, you can drag a switch and add to a site that already has a switch or SRX Series device.

[Table 129 on page 306](#) shows fields on the Secure Fabric page.

Table 301: Fields on the Secure Fabric Page

Field	Description
Site	Specifies the name of the secure fabric site.
Enforcement Points	<p>Specifies the enforcement points for that particular site, if enforcement points are already added. If not added, click Add Enforcement Points to add Firewalls, Switches, or Connectors as enforcement points.</p> <p>A firewall icon is shown against some of the devices to indicate that they are the perimeter firewalls.</p> <p>For connectors, if you hover over the enforcement point, a tool tip is shown listing the corresponding vSRX devices with IP addresses and descriptions.</p>
Model	Specifies the type of the enforcement point. For example, vSRX, QFX, Connector.
IP	Specifies the IP address of the enforcement point, if the enforcement point is available.
SKYATP Enroll Status	<p>Specifies the status of the SkyATP enrollment.</p> <p>The Success status with a warning symbol indicates that the device is enabled for cloud feeds only and there is no support for malware capability and enhanced mode. This field will be blank if the device fails to disenroll SkyATP.</p> <p>If the status is Failed, click Retry to enroll the device with Sky ATP again. You can hover over the Failed status to see the corresponding job details. The device enroll retry option is available only when the status is Failed.</p>
Last Updated	Specifies the date on which the Secure Fabric page was last updated.

Table 301: Fields on the Secure Fabric Page (continued)

Field	Description
Description	Specifies the description that you had entered at the time of creating a secure fabric site.

RELATED DOCUMENTATION

Creating Secure Fabric and Sites 304
Policy Enforcement Groups Overview 771
Threat Prevention Policy Overview 677

Creating Secure Fabric and Sites

To access this page, click **Devices>Secure Fabric**.

You create sites within your secure fabric from the secure fabric page.

- Plan out your sites in advance. A site is a grouping of network devices, including firewalls and switches, that contribute to threat prevention.
- Keep in mind that when you create a site, you must identify the perimeter firewalls so you can enroll them with Sky ATP.
- If you want to enforce an infected host policy within the network, you must assign a switch to the site.
- Devices *cannot* belong to multiple sites.
- Switches and connectors *cannot* be added to the same site

To create a site within your secure fabric:

1. Select **Devices>Secure Fabric**.
2. Click the + icon.
3. Complete the configuration by using the guidelines in [Table 128 on page 305](#) below.
4. Click **OK**.
5. Create a new site and add an enforcement point to a site.

Table 302: Fields on the Create Site Page

Field	Description
Site	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.

WARNING: If you add certain SRX Series Devices to your Secure Fabric as enforcement points, you may see a warning that the device(s) must be reconfigured in enhanced mode and require a reboot. Here is a list of SRX models that may require rebooting for enhanced mode after being registered with Policy Enforcer/Sky ATP.

- SRX340
- SRX345
- SRX650
- SRX240h2
- SRX320
- SRX300
- SRX550

Editing or Deleting a Secure Fabric

You can edit or delete a secure fabric from the secure fabric main page.

Editing or Deleting a Secure Fabric

To edit or delete a secure fabric:

1. Select **Devices > Secure Fabric**.

The secure fabric page appears.

2. Select the secure fabric you want to edit or delete and then right-click.

- Select **Edit** to modify your secure fabric. The secure fabric configuration page appears. Make the changes and click **OK**.
- Select **Delete** to remove your secure fabric. An alert message appears verifying that you want to delete your selection. Click **Yes** to delete your selection.

RELATED DOCUMENTATION

[Secure Fabric Overview | 305](#)

[Creating Policy Enforcement Groups | 769](#)

Policy Enforcement Groups Overview

A policy enforcement group is a grouping of endpoints to which threat prevention policies are applied. Create a policy enforcement group by adding endpoints (firewalls, switches, subnets, set of end users) under one common group name and later applying a threat prevention policy to that group.

RELATED DOCUMENTATION

[Creating Policy Enforcement Groups | 769](#)

[Threat Prevention Policy Overview | 677](#)

Creating Policy Enforcement Groups

To access this page, click **Configure>Shared Objects>Policy Enforcement Groups**.

You can create policy enforcement groups from the policy enforcement groups page.

- Know what type of endpoints you are including in your policy enforcement group: IP address/subnet, or location.
- Determine what endpoints you will add to the group based on how you will configure threat prevention according to location, users and applications, or threat risk.
- Keep in mind that endpoints *cannot* belong to multiple policy enforcement groups.

To create a policy enforcement group:

1. Select **Configure>Shared Objects>Policy Enforcement Groups**.
2. Click the + icon.
3. Complete the configuration by using the guidelines in the [Table 263 on page 770](#) below.
4. Click **OK**.

Table 303: Fields on the Policy Enforcement Group Page

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include only dashes and underscores; no spaces allowed; 32-character maximum.
Description	Enter a description; maximum length is 64 characters. You should make this description as useful as possible for all administrators.
Group Type	Select a group type from the available choices. IP Address/Subnet or Location.

Table 303: Fields on the Policy Enforcement Group Page (*continued*)

Field	Description
Connector IPs	<p>This field is available only if the Group Type field is IP Address/Subnet</p> <p>The subnets of all connectors added in the Connector page are dynamically listed in the Available column. If the Group Type is IP Address/Subnet, the subnets within the connector instances that have the threat remediation enabled are only listed.</p> <p>When using Junos Space, Policy Enforcer is able to dynamically discover subnets configured on Juniper switches. Policy Enforcer does not have the same insight with third-party devices. Therefore you can add subnets to your connector configuration and select them here. This allows you to selectively apply policies to those subnets.</p> <p>If you have not configured a connector, you will see only Junos Space subnets discovered by Policy Enforcer. If you have a connector configured, you can see the subnets of a connector in the Available column. Hover over subnets to view the description for these subnets entered during the connector creation. You will not see any description if it is not entered during creating a connector. The description will show “No description available” for subnets that come from Junos Space.</p> <p>The Available and Selected columns have filters listed with connectors or Space. You can choose a connector and filter only the subnets belonging to that particular connector. The result shows the name of a device to which the subnet belongs and also the type of the device.</p> <p>You can also use the search bar to search and filter the result based on subnet, name of the device, or type of the device.</p> <p>Click Refresh Available IPs to refresh the available IP addresses or subnets. If you edit any selected items in the Selected column, the list is refreshed to the initial selected list after the refresh. A progress bar is shown with the refresh progress in percentage.</p> <p>In a scenario where there are no IP addresses or subnets, the refresh will still be successful. A message is displayed showing that the refresh was successful but there are no IP addresses or subnets found.</p>
Additional IP	<p>This field is available only if the Group Type field is IP Address/Subnet</p> <p>Enter an IP address and select the connector type from the list to add to PEG. The IP address must be within the subnet range of the selected connector. Click Add to add the additional IP address to the Selected column of the Connector IPs field.</p> <p>A validation is performed to check if the additional IP address is within the subnet range of the selected connector. If not, an error message is shown to enter the IP address within the subnet range.</p>
Sites	<p>Sites with the threat remediation enabled instances are only listed, if the Group Type is Location. Select the check box beside the sites in the Available list and click the > icon to move them to the Selected list.</p> <p>The endpoints in the Selected list will be included in the policy enforcement group.</p>

You can create a policy enforcement group with subnets from different connectors based on how they have grouped their network segments. For example, If you have Junos Space EX switch with subnets HR: 1.1.1.1/24 and Finance: 2.2.2.2/24, ClearPass connector with subnets HR: 1.1.1.1/24 and Marketing: 2.2.2.2/24, Cisco ISE with subnets HR: 1.1.1.1/24 and Finance: 2.2.2.2/24. You can create a single policy enforcement group and name it as HR by choosing the following subnets: Junos Space EX HR: 1.1.1.1/24, ClearPass connector subnet HR: 1.1.1.1/24, and Cisco ISE connector subnet HR: 1.1.1.1/24.

RELATED DOCUMENTATION

[Using Guided Setup for Sky ATP with SDSN | 937](#)

Threat Prevention Policy Overview

Threat prevention policies provide protection and monitoring for selected threat profiles, including command and control servers, infected hosts, and malware. Using feeds from Sky ATP and optional custom feeds that you configure, ingress and egress traffic is monitored for suspicious content and behavior. Based on a threat score, detected threats are evaluated and action may be taken once a verdict is reached.

Once policies are configured, the following fields are available on the Security Director main page to provide an overview of each policy.

Table 304: Threat Prevention Policy Fields

Field	Description
Name	The user-created name for the policy.
Profile: C&C Server	Threat score settings overview if selected for the policy. (Otherwise this field is empty.) For example: Block: 8-10 Monitor: 5-7 Permit: 1-4
Profile: Infected Host	Threat score settings overview if selected for the policy. (Otherwise this field is empty.)
Profile: Malware HTTP	Threat score settings overview if selected for the policy. (Otherwise this is empty.)

Table 304: Threat Prevention Policy Fields (continued)

Field	Description
Profile: Malware SMTP	Threat score settings overview if selected for the policy. (Otherwise this field is empty.)
Status	<p>This displays the status of the policy. This status is a clickable link you can use to change the policy status. When you first create a policy and assign it to a group, this field reads View Analysis. Read “Threat Policy Analysis Overview” on page 679 for more information on this field.</p> <p>If the status is Update Failed, click Retry to perform the rule analysis again. You can click the Update Failed status to see the corresponding job details. The rule analysis retry option is available only when the status is Update Failed.</p> <p>NOTE: If the policy has been updated after it has already been pushed to the endpoint, the status here is Update with a warning icon to notify you the policy has been changed but not pushed.</p>
Policy Enforcement Group	This is the group to which the policy is assigned.
Log	This field displays the log setting for the policy.
Description	The user-created description for the policy.

Benefits of Threat Prevention Policy

- Enables you to define and enforce policies for controlling specific applications and embedded social networking widgets.
- Reduces the need for manual updates and automatically applies policies and enforcement rules, driving down the costs of managing network security.
- Leverages the network for multiple enforcement points across the infrastructure. Enables you to stop threats closer to infection points and to prevent threats from spreading, which greatly improves the efficacy of security operations.

[Sky ATP Overview | 841](#)

Creating Threat Prevention Policies

To access this page, select **Configure>Threat Prevention > Policy**.

You can create threat prevention policies from the policy page.

NOTE: If you are creating policies for the first time, you are given the option of setting up Policy Enforcer with Sky ATP or configuring Sky ATP alone. Clicking either button takes you to quick setup for your selection. See [“Comparing the SDSN and non-SDSN Configuration Steps” on page 855](#) for a configuration comparison.

- Determine the type of profile you will use for this policy; command & control server, infected hosts, malware. You can select one or more threat profiles in a policy. Note that you configure Geo IP policies separately. See [“Creating Geo IP Policies” on page 765](#).
- Determine what action to take if a threat is found.
- Know what policy enforcement group you will add to this policy. To apply the policy, you must assign one or more policy enforcement groups. See the instructions for assigning groups to policies at the bottom of this page.
- Once policies are configured with one more groups assigned, you can save a policy in draft form or update it. Policies changes do not go live until they have been updated.
- If you are using Sky ATP without Policy Enforcer, you must assign your threat prevention policy to a firewall rule for it to take affect. See the instructions at the bottom of this page.
- If you delete a threat prevention policy that is assigned to a policy enforcement group, a status screen appears displaying the progress of the deletion and the affected configuration items.

To create a threat prevention policy:

1. Select **Configure>Threat Prevention > Policy**.
2. Click the + icon.

The Create Threat Prevention Policy page appears.

3. Complete the configuration by using the guidelines in the [Table 226 on page 672](#), [Table 227 on page 672](#), [Table 228 on page 673](#), [Table 229 on page 674](#), and [Table 230 on page 675](#) below.
4. Click **OK**.

Table 305: Fields on the Threat Prevention Policy Page

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.
Log Setting (Policy setting for all profiles)	Select the log setting for the policy. You can log all traffic, log only blocked traffic, or log no traffic.

[Table 227 on page 672](#) shows the management of command and control server threat in a policy.

Table 306: C&C Server Profile Management

Field	Description
Command and Control Server	Select and choose settings for command and control servers. A C&C is a centralized computer that issues commands to botnets (compromised networks of computers) and receives reports back from them. Botnets can be used to gather sensitive information, such as account numbers or credit card information, or to participate in a distributed denial-of-service (DDoS) attack.
<i>Include C& C profile in policy</i>	Select the check box to include management for this threat type in the policy.
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. Refer to the monitoring pages in the UI to investigate, located under Monitor > Threat Management .

Table 306: C&C Server Profile Management (*continued*)

Field	Description
Actions	<p>If the threat score is high enough to cause a connection to be blocked, you have following configurable options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Close connection and do not send a message <ul style="list-style-type: none"> • Close connection and redirect to URL—In the field provided, enter a URL to redirect users to when connections are dropped. • Send custom message—In the field provided, enter a message to be shown to users when connections are dropped.

Table 228 on page 673 shows the management of infected host threat in a policy.

Table 307: Infected Host Profile Management

Field	Description
Infected Host	Infected hosts are systems for which there is a high confidence that attackers have gained unauthorized access. Infected hosts data feeds are listed with the IP address or IP subnet of the host, along with a threat score.
<i>Include infected host profile in policy</i>	<p>Select the check box to include management for this threat type in the policy.</p> <p>NOTE: If you want to enforce an infected host policy <i>within</i> the network, you must include a switch in the site.</p>
Actions	<p>You have following options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Quarantine—In the field provided, enter a VLAN to which quarantined files are sent. (Note that the fallback option is to block and drop the connection silently.)

Table 229 on page 674 shows the management of malware threat in a policy.

Table 308: Malware Threat Profile Management

Field	Description
Malware (HTTP file download, SMTP File attachment, and IMAP attachments)	Malware is files that are downloaded by hosts or received as email attachments and found to be suspicious based on known signatures, URLs. or other heuristics.

Table 308: Malware Threat Profile Management (*continued*)

Field	Description
<i>Include malware profile in policy</i>	Select the check box to include management for this threat type in the policy.
HTTP file download	Turn this feature on to scan files downloaded over HTTP and then select a file scanning device profile. The device profile is configured using Sky ATP.
Scan HTTPS	Turn this feature to scan encrypted files downloaded over HTTPS.
Device Profile	Select a Sky ATP device profile. This is configured through Sky ATP. Sky ATP profiles let you define which files to send to the cloud for inspection. You can group types of files to be scanned together under a common name and create multiple profiles based on the content you want scanned. <i>Device Profiles Overview</i> .
Actions	<p>If the threat score is high enough to cause a connection to be blocked, you have following configurable options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Close connection and do not send a message <ul style="list-style-type: none"> • Close connection and redirect to URL—In the field provided, enter a URL to redirect users to when connections are dropped. • Send custom message—In the field provided, enter a message to be shown to users when connections are dropped.
SMTP File Attachments	Turn this feature on to inspect files received as email attachments (over SMTP only).
Scan SMTPS	<p>Enable this option to configure reverse proxy for SMTP.</p> <p>The reverse proxy does not prohibit server certificates. It forwards the actual server certificate or chain as is to the client without modifying it.</p>
Device Profile	<p>If you do not click the Change button to select a device profile for SMTP scanning, the device profile selected for HTTP will be used by default.</p> <p>Select Change to use a different device profile for SMTP.</p> <p>Device profiles are configured through Sky ATP and define which files to send to the cloud for inspection.</p>
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. This threat score applies to all malware, HTTP and SMTP. (Note: There is no monitoring setting for malware.)

Table 308: Malware Threat Profile Management (*continued*)

Field	Description
Actions	Actions for SMTP File Attachments include: Quarantine, Deliver malicious messages with warning headers added, and Permit. This actions are set in Sky ATP. Refer to the Sky ATP documentation for information.
IMAP Attachments	Turn this feature on to select a a file scanning device profile and threat score ranges to apply to IMAP e-mails.
Scan IMAPS	Enable this option to configure reverse proxy for IMAP e-mails.
Device Profile	<p>If you do not click the Change button to select a device profile for IMAP scanning, the device profile selected for HTTP will be used by default.</p> <p>Select Change to use a different device profile for IMAP.</p> <p>Device profiles are configured through Sky ATP and define which files to send to the cloud for inspection.</p>
Actions	Actions for IMAP Attachments include: Block, Deliver malicious messages with warning headers added, and Permit. This actions are set in Sky ATP. Refer to the Sky ATP documentation for information.
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. This threat score applies to all malware, HTTP, SMTP, and IMAP. (Note: There is no monitoring setting for malware.)

Table 230 on page 675 shows the management of DDoS threat in a policy

Table 309: DDoS Threat Profile Management

Field	Description
<i>Include DDoS Profile in Policy</i>	<p>Enable this option to include the management of Distributed denial-of-service (DDoS) protection that enables the MX router to quickly identify an attack and prevent a flood of malicious control packets from exhausting system resources.</p> <p>When you create a threat policy for the DDoS profile, it is not pushed to the device because the policy is not yet assigned to any device. Assign the policy to the policy enforcement group. Because the policy is created for the MX router, rule analysis is not initiated when a policy is assigned to the policy enforcement group (PEG).</p>

Table 309: DDoS Threat Profile Management (*continued*)

Field	Description
Actions	<p>Select the following actions from the list for the DDoS profile:</p> <ul style="list-style-type: none"> • Block—Use this option to block the DDoS attack. • Rate Limit Value—Use this option to limit the bandwidth on the flow route. You can express the rate limit value in Kbps, Mbps, or Gbps units. The rate limit range is 10Kbps to 100Gbps. • Forward to—Use this option to configure the routing next hop to forward the packets for scrubbing.
Scrubbing Site	Specify a routing instance to which packets are forwarded in the <i>as-number:community-value</i> format, where each value is a decimal number. For example, 65001:100.

Once you have a threat prevention policy, you assign one or more groups to it:

1. In the threat prevention policy main page (located under **Configure > Threat Prevention > Policy**), find the appropriate policy.
2. In the Groups column, click the **Assign to Groups** link that appears here when there are no policy enforcement groups assigned or click the group name that appears in this column to edit the existing list of assigned groups. You can also select the check box beside a policy and click the **Assign to Groups** button at the top of the page. See [“Policy Enforcement Groups Overview” on page 771](#).
3. In the Assign to Groups page, select the check box beside a group in the Available list and click the > icon to move it to the Selected list. The groups in the Selected list will be assigned to the policy.
4. Click **OK**.
5. Once one or more policy enforcement groups have been assigned, a **Ready to Update** link appears in the Status column. You must update to apply your new or edited policy configuration. Clicking the Ready to Update link takes you the Threat Policy Analysis page. See [“Threat Policy Analysis Overview” on page 679](#). From there you can view your changes and choose to Update now, Update later, or Save them in draft form without updating.
6. If you are using Sky ATP without Policy Enforcer, you must assign your threat prevention policy to a firewall rule for it to take affect. Navigate to **Configure > Firewall Policy > Policies**. In the Advanced Security column, click an item to access the Edit Advanced Security page and select the threat prevention policy from the **Threat Prevention** pulldown list.

Threat Policy Analysis Overview

To access this page, click **Configure>Threat Prevention > Policy** and click the **Ready to Update** link in the Status column.

You can update policy changes from this page. Policies must be updated before they can go live.

NOTE: If the policy has been updated after it has already been pushed to the endpoint, the status here is **Update** with a warning icon to notify you the policy has been changed but not pushed.

Use the threat policy analysis page to view your pending policy changes in chronological order. Click the **View Analysis** link to view the changes. In the Action section, you can select to Update now, Update later, or Save the changes without updating. If you select to update later, you can schedule a time to update.

By clicking on the policy links, you can update only the policies you select and choose not to update others.

Geo IP Overview

Geo IP refers to the method of locating a computer terminal's geographic location by identifying that terminal's IP address. A Geo IP feed is an up-to-date mapping of IP addresses to geographical regions. By mapping IP address to the sources of attack traffic, geographic regions of origin can be determined, giving you the ability to filter traffic to and from specific locations in the world.

RELATED DOCUMENTATION

[Creating Geo IP Policies | 765](#)

[Threat Prevention Policy Overview | 677](#)

[Sky ATP Realm Overview | 691](#)

Creating Geo IP Policies

To access this page, click **Configure>Shared Objects>Geo IP**.

You can create Geo IP policies from the Geo IP policies page.

- You must have a Sky ATP account to receive Geo IP feeds. Make sure you configure the necessary steps for Sky ATP before creating a Geo IP policy.
- Geo IP filtering is a useful tool when you are experiencing certain types of attacks, such as DDOS from specific geographical locations.
- If you are using Sky ATP without Policy Enforcer, you must select your Geo IP policy as the source and/or destination of a firewall rule to apply it.

To create a Geo IP policy:

1. Select **Configure>Shared Objects>Geo IP**.
2. Click the + icon.
3. Complete the configuration by using the guidelines in [Table 262 on page 765](#) below.
4. Click **OK**.

Table 310: Fields on the Geo IP Policy Page

Name	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.
Countries	Select the check box beside the countries in the Available list and click the > icon to move them to the Selected list. The countries in the Selected list will be included in the policy and action will be taken according to their threat level.
Block Traffic	Choose what traffic to block from the selected countries. Incoming traffic, Outgoing traffic, or Incoming and Outgoing traffic. (Policy Enforcer only)
Log Setting	Choose to log all traffic or only blocked traffic. (Policy Enforcer only)

Once you have a Geo IP policy, you assign it to one more groups (Policy Enforcer only):

1. In the Group column, click the **Assign to Groups** link that appears here when there are no groups assigned or click the group name that appears in this column to edit the existing list of assigned groups.
2. In the Assign to Groups page, select the check box beside a group in the Available list and click the > icon to move it to the Selected list. The groups in the Selected list will be assigned to the policy.
3. Click **OK**.
4. Once one or more groups have been assigned, a **Ready to Update** link appears in the Status column. You must update to apply your new or edited policy configuration. Clicking the Ready to Update link takes you the Threat Policy Analysis page. See [“Threat Policy Analysis Overview” on page 679](#). From there you can view your changes and choose to Update now, Update later, or Save them in draft form without updating.
5. If you are using Sky ATP without Policy Enforcer, you must select your Geo IP policy as the source and/or destination of a firewall rule. Navigate to **Configure > Firewall Policy > Policies**.

Configuring Sky ATP (No SDSN and No Guided Setup) Overview

This is an outline of the configuration tasks you must complete to configure Sky ATP mode without SDSN mode.

NOTE: Configuring Policy Enforcer (SDSN mode) is required if you want to work on the SDSN architecture from within Security Director.

If you prefer to use guided setup, which automatically takes you through the steps listed below, it is located under **Configure>Guided Setup >Sky ATP**.

- A Sky ATP license and account are needed for all threat prevention types (Sky ATP with PE, Sky ATP, and Cloud Feeds only). If you do not have a Sky ATP license, contact your local sales office or Juniper Networks partner to place an order for a Sky ATP premium license. If you do not have a Sky ATP account, when you configure Sky ATP, you are redirected to the Sky ATP server to create one. Please obtain a license before you try to create a Sky ATP account. Refer to [“Obtaining a Sky ATP License” on page 878](#) for instructions on obtaining a Sky ATP premium license.
- Before you configure Sky ATP you must enter the IP address and login credentials for the policy enforcer virtual machine. Go to **Administration > Policy Enforcer > Settings**. Once this information is entered, you can begin the setup process. See [“Policy Enforcer Settings” on page 884](#). (Refer to [“Policy Enforcer Installation Overview” on page 857](#) for instructions on downloading Policy Enforcer and creating your policy enforcer virtual machine.)

1. Create one or more Sky ATP realms and enroll SRX Series devices in the appropriate realm. (Enroll devices by clicking **Add Devices** in the list view once the realm is created.)

In the UI, navigate to **Configure>Threat Prevention>Sky ATP Realms**. Click the + icon to add a new Sky ATP realm.

See [“Creating Sky ATP Realms and Enrolling Devices or Associating Sites” on page 692](#) for details.
2. Create a threat prevention policy, including profiles for one or more threat types: C&C server, infected host, or malware.

In the UI, navigate to **Configure>Threat Prevention >Policy**. Click the + icon to create a new threat prevention policy.

See [“Creating Threat Prevention Policies” on page 671](#) for details.
3. You must assign a threat prevention policy to a firewall rule before it can take affect.

In the UI, navigate to **Configure > Firewall Policy > Policies**. In the Advanced Security column, click an item to access the Edit Advanced Security page and select the threat prevention policy from the **Threat Prevention** pulldown list.

Sky ATP Realm Overview

A security realm is a group identifier for an organization used to restrict access to Web applications. You must create at least one security realm to login into Sky ATP. Once you create a realm, you can enroll SRX Series devices into the realm. You can also give more users (administrators) permission to access the realm.

If you have multiple security realms, note that each SRX Series device can only be bound to one realm, and users cannot travel between realms.

[Table 232 on page 691](#) provides the guidelines on using the fields on the Sky ATP Realm page.

Table 311: Fields on the Sky ATP Realm Page

Field	Description
Realm	Specifies the name of a realm.
Sites	Specifies the site name associated to the realm.
Location	Specifies the region of the realm.
Devices	Specifies the perimeter firewall devices that are enrolled to Sky ATP.
Enrollment Status	Specifies the enrollment status of the realm.

RELATED DOCUMENTATION

[Using Guided Setup for Sky ATP | 940](#)

[skyConfiguring Sky ATP \(No SDSN and No Guided Setup\) Overview | 970](#)

Creating Sky ATP Realms and Enrolling Devices or Associating Sites

To access this page, click **Configure>Threat Prevention>Sky ATP Realms**.

You can create Sky ATP realms from the Sky ATP page.

- Understand which type of Sky ATP license you have: free, basic, or premium. The license controls which Sky ATP features are available.
- To configure a Sky ATP realm, you must already have a Sky ATP account with an associated license.
- Ensure that the internet connectivity is available for Policy Enforcer. Without the internet connectivity, you cannot create a realm.
- Decide which region will be covered by the realm you are creating. You must select a region when you configure a realm.
- Note that adding a device to a realm results in one or more commit operations occurring on the device to apply the Sky ATP or Policy Enforcer configuration.

To configure a Sky ATP Realm:

1. Select **Configure>Threat Prevention>Sky ATP Realms**.
2. Click the + icon.
3. Complete the initial configuration by using the guidelines in [Table 233 on page 693](#) below.

Table 312: Fields on the Add Sky ATP Realm Page

Field	Description
Location	<p>Select a region of the world from the available choices.</p> <p>The following options are available in the Location list:</p> <ul style="list-style-type: none"> • North America • European Region • Canada • Asia Pacific <p>By default, the North America value appears in the list. To know more about the geographic region, see here.</p>
Username	Enter your e-mail address. Your username for Sky ATP is your e-mail address.
Password	Enter a unique string at least 8 characters long. Include both uppercase and lowercase letters, at least one number, and at least one special character (~!@#\$%^&*()_-=+{}[] ;:<>.,/?); no spaces are allowed, and you cannot use the same sequence of characters that are in your username.
Realm	<p>Enter a name for the security realm. This should be a name that is meaningful to your organization. A realm name can only contain alphanumeric characters and the dash symbol. Once created, this name cannot be changed.</p> <p>NOTE: When you create a custom feed with a realm, the feed is associated at the site level and not at the realm level. If you modify this realm and associate new sites to it, a warning message is shown that there are custom feeds are associated with this realm. Changing the site information will change the custom feed information. You must go and edit the custom feed that was associated with this realm and verify the realm association.</p>

4. Click **Next** and guided setup walks you through the steps for enrolling devices into the realm and associating sites for Policy Enforcer.

The next steps include the following:

5. If you are using Sky ATP with PE and you have no devices enrolled in the realm, you are asked to select devices in the box on the left and move them to the right to enroll them. All selected devices are automatically enrolled with Sky ATP when you finish guided setup. To disenroll a device, you can edit a realm and move the device back to the left side box.

NOTE: Note that adding a device to a realm results in one or more commit operations occurring on the device to apply the Sky ATP or Policy Enforcer configuration.

6. Next you select a Site from the list to contain the devices. If there are no sites associated with the realm, click **Create new site**. See [“Creating Secure Fabric and Sites” on page 304](#).

NOTE: If you are using Sky ATP without PE, you are not prompted to select a site.

7. Once the devices and site are selected, you use the sidebar to choose a threshold level at which selected administrators are notified via email about infected host events. Click the+ sign if you want to add new administrators to the list.
8. Finally, you select one or more check boxes for event types you want to log.
9. Click **Finish**.

NOTE: If you enrolled a device into a realm from within Security Director and you want to disenroll it, you must do that from within Security Director. If you enrolled a device into a realm from within Sky ATP and you want to disenroll it, you must do that from within Sky ATP. You cannot disenroll a device from within Security Directory that was enrolled from within Sky ATP.

Threat Prevention Policy Overview

Threat prevention policies provide protection and monitoring for selected threat profiles, including command and control servers, infected hosts, and malware. Using feeds from Sky ATP and optional custom feeds that you configure, ingress and egress traffic is monitored for suspicious content and behavior. Based on a threat score, detected threats are evaluated and action may be taken once a verdict is reached.

Once policies are configured, the following fields are available on the Security Director main page to provide an overview of each policy.

Table 313: Threat Prevention Policy Fields

Field	Description
Name	The user-created name for the policy.
Profile: C&C Server	Threat score settings overview if selected for the policy. (Otherwise this field is empty.) For example: Block: 8-10 Monitor: 5-7 Permit: 1-4
Profile: Infected Host	Threat score settings overview if selected for the policy. (Otherwise this field is empty.)
Profile: Malware HTTP	Threat score settings overview if selected for the policy. (Otherwise this is empty.)
Profile: Malware SMTP	Threat score settings overview if selected for the policy. (Otherwise this field is empty.)

Table 313: Threat Prevention Policy Fields (continued)

Field	Description
Status	<p>This displays the status of the policy. This status is a clickable link you can use to change the policy status. When you first create a policy and assign it to a group, this field reads View Analysis. Read “Threat Policy Analysis Overview” on page 679 for more information on this field.</p> <p>If the status is Update Failed, click Retry to perform the rule analysis again. You can click the Update Failed status to see the corresponding job details. The rule analysis retry option is available only when the status is Update Failed.</p> <p>NOTE: If the policy has been updated after it has already been pushed to the endpoint, the status here is Update with a warning icon to notify you the policy has been changed but not pushed.</p>
Policy Enforcement Group	This is the group to which the policy is assigned.
Log	This field displays the log setting for the policy.
Description	The user-created description for the policy.

Benefits of Threat Prevention Policy

- Enables you to define and enforce policies for controlling specific applications and embedded social networking widgets.
- Reduces the need for manual updates and automatically applies policies and enforcement rules, driving down the costs of managing network security.
- Leverages the network for multiple enforcement points across the infrastructure. Enables you to stop threats closer to infection points and to prevent threats from spreading, which greatly improves the efficacy of security operations.

Creating Threat Prevention Policies

To access this page, select **Configure>Threat Prevention > Policy**.

You can create threat prevention policies from the policy page.

NOTE: If you are creating policies for the first time, you are given the option of setting up Policy Enforcer with Sky ATP or configuring Sky ATP alone. Clicking either button takes you to quick setup for your selection. See [“Comparing the SDSN and non-SDSN Configuration Steps” on page 855](#) for a configuration comparison.

- Determine the type of profile you will use for this policy; command & control server, infected hosts, malware. You can select one or more threat profiles in a policy. Note that you configure Geo IP policies separately. See [“Creating Geo IP Policies” on page 765](#).
- Determine what action to take if a threat is found.
- Know what policy enforcement group you will add to this policy. To apply the policy, you must assign one or more policy enforcement groups. See the instructions for assigning groups to policies at the bottom of this page.
- Once policies are configured with one more groups assigned, you can save a policy in draft form or update it. Policies changes do not go live until they have been updated.
- If you are using Sky ATP without Policy Enforcer, you must assign your threat prevention policy to a firewall rule for it to take affect. See the instructions at the bottom of this page.
- If you delete a threat prevention policy that is assigned to a policy enforcement group, a status screen appears displaying the progress of the deletion and the affected configuration items.

To create a threat prevention policy:

1. Select **Configure>Threat Prevention > Policy**.
2. Click the + icon.

The Create Threat Prevention Policy page appears.

3. Complete the configuration by using the guidelines in the [Table 226 on page 672](#), [Table 227 on page 672](#), [Table 228 on page 673](#), [Table 229 on page 674](#), and [Table 230 on page 675](#) below.
4. Click **OK**.

Table 314: Fields on the Threat Prevention Policy Page

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.
Log Setting (Policy setting for all profiles)	Select the log setting for the policy. You can log all traffic, log only blocked traffic, or log no traffic.

[Table 227 on page 672](#) shows the management of command and control server threat in a policy.

Table 315: C&C Server Profile Management

Field	Description
Command and Control Server	Select and choose settings for command and control servers. A C&C is a centralized computer that issues commands to botnets (compromised networks of computers) and receives reports back from them. Botnets can be used to gather sensitive information, such as account numbers or credit card information, or to participate in a distributed denial-of-service (DDoS) attack.
<i>Include C& C profile in policy</i>	Select the check box to include management for this threat type in the policy.
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. Refer to the monitoring pages in the UI to investigate, located under Monitor > Threat Management .
Actions	<p>If the threat score is high enough to cause a connection to be blocked, you have following configurable options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Close connection and do not send a message <ul style="list-style-type: none"> • Close connection and redirect to URL—In the field provided, enter a URL to redirect users to when connections are dropped. • Send custom message—In the field provided, enter a message to be shown to users when connections are dropped.

[Table 228 on page 673](#) shows the management of infected host threat in a policy.

Table 316: Infected Host Profile Management

Field	Description
Infected Host	Infected hosts are systems for which there is a high confidence that attackers have gained unauthorized access. Infected hosts data feeds are listed with the IP address or IP subnet of the host, along with a threat score.
<i>Include infected host profile in policy</i>	Select the check box to include management for this threat type in the policy. NOTE: If you want to enforce an infected host policy <i>within</i> the network, you must include a switch in the site.
Actions	You have following options: <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Quarantine—In the field provided, enter a VLAN to which quarantined files are sent. (Note that the fallback option is to block and drop the connection silently.)

[Table 229 on page 674](#) shows the management of malware threat in a policy.

Table 317: Malware Threat Profile Management

Field	Description
Malware (HTTP file download, SMTP File attachment, and IMAP attachments)	Malware is files that are downloaded by hosts or received as email attachments and found to be suspicious based on known signatures, URLs. or other heuristics.
<i>Include malware profile in policy</i>	Select the check box to include management for this threat type in the policy.
HTTP file download	Turn this feature on to scan files downloaded over HTTP and then select a file scanning device profile. The device profile is configured using Sky ATP.
Scan HTTPS	Turn this feature to scan encrypted files downloaded over HTTPS.
Device Profile	Select a Sky ATP device profile. This is configured through Sky ATP. Sky ATP profiles let you define which files to send to the cloud for inspection. You can group types of files to be scanned together under a common name and create multiple profiles based on the content you want scanned. <i>Device Profiles Overview</i> .

Table 317: Malware Threat Profile Management (*continued*)

Field	Description
Actions	<p>If the threat score is high enough to cause a connection to be blocked, you have following configurable options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Close connection and do not send a message <ul style="list-style-type: none"> • Close connection and redirect to URL—In the field provided, enter a URL to redirect users to when connections are dropped. • Send custom message—In the field provided, enter a message to be shown to users when connections are dropped.
SMTP File Attachments	Turn this feature on to inspect files received as email attachments (over SMTP only).
Scan SMTPS	<p>Enable this option to configure reverse proxy for SMTP.</p> <p>The reverse proxy does not prohibit server certificates. It forwards the actual server certificate or chain as is to the client without modifying it.</p>
Device Profile	<p>If you do not click the Change button to select a device profile for SMTP scanning, the device profile selected for HTTP will be used by default.</p> <p>Select Change to use a different device profile for SMTP.</p> <p>Device profiles are configured through Sky ATP and define which files to send to the cloud for inspection.</p>
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. This threat score applies to all malware, HTTP and SMTP. (Note: There is no monitoring setting for malware.)
Actions	Actions for SMTP File Attachments include: Quarantine, Deliver malicious messages with warning headers added, and Permit. This actions are set in Sky ATP. Refer to the Sky ATP documentation for information.
IMAP Attachments	Turn this feature on to select a a file scanning device profile and threat score ranges to apply to IMAP e-mails.
Scan IMAPS	Enable this option to configure reverse proxy for IMAP e-mails.

Table 317: Malware Threat Profile Management (*continued*)

Field	Description
Device Profile	<p>If you do not click the Change button to select a device profile for IMAP scanning, the device profile selected for HTTP will be used by default.</p> <p>Select Change to use a different device profile for IMAP.</p> <p>Device profiles are configured through Sky ATP and define which files to send to the cloud for inspection.</p>
Actions	Actions for IMAP Attachments include: Block, Deliver malicious messages with warning headers added, and Permit. These actions are set in Sky ATP. Refer to the Sky ATP documentation for information.
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. This threat score applies to all malware, HTTP, SMTP, and IMAP. (Note: There is no monitoring setting for malware.)

Table 230 on page 675 shows the management of DDoS threat in a policy

Table 318: DDoS Threat Profile Management

Field	Description
<i>Include DDoS Profile in Policy</i>	<p>Enable this option to include the management of Distributed denial-of-service (DDoS) protection that enables the MX router to quickly identify an attack and prevent a flood of malicious control packets from exhausting system resources.</p> <p>When you create a threat policy for the DDoS profile, it is not pushed to the device because the policy is not yet assigned to any device. Assign the policy to the policy enforcement group. Because the policy is created for the MX router, rule analysis is not initiated when a policy is assigned to the policy enforcement group (PEG).</p>
Actions	<p>Select the following actions from the list for the DDoS profile:</p> <ul style="list-style-type: none"> • Block—Use this option to block the DDoS attack. • Rate Limit Value—Use this option to limit the bandwidth on the flow route. You can express the rate limit value in Kbps, Mbps, or Gbps units. The rate limit range is 10Kbps to 100Gbps. • Forward to—Use this option to configure the routing next hop to forward the packets for scrubbing.
Scrubbing Site	Specify a routing instance to which packets are forwarded in the <i>as-number:community-value</i> format, where each value is a decimal number. For example, 65001:100.

Once you have a threat prevention policy, you assign one or more groups to it:

1. In the threat prevention policy main page (located under **Configure>Threat Prevention > Policy**), find the appropriate policy.
2. In the Groups column, click the **Assign to Groups** link that appears here when there are no policy enforcement groups assigned or click the group name that appears in this column to edit the existing list of assigned groups. You can also select the check box beside a policy and click the **Assign to Groups** button at the top of the page. See [“Policy Enforcement Groups Overview” on page 771](#) .
3. In the Assign to Groups page, select the check box beside a group in the Available list and click the > icon to move it to the Selected list. The groups in the Selected list will be assigned to the policy.
4. Click **OK**.
5. Once one or more policy enforcement groups have been assigned, a **Ready to Update** link appears in the Status column. You must update to apply your new or edited policy configuration. Clicking the Ready to Update link takes you the Threat Policy Analysis page. See [“Threat Policy Analysis Overview” on page 679](#). From there you can view your changes and choose to Update now, Update later, or Save them in draft form without updating.
6. If you are using Sky ATP without Policy Enforcer, you must assign your threat prevention policy to a firewall rule for it to take affect. Navigate to **Configure > Firewall Policy > Policies**. In the Advanced Security column, click an item to access the Edit Advanced Security page and select the threat prevention policy from the **Threat Prevention** pulldown list.

Configuring Cloud Feeds Only

IN THIS CHAPTER

- [Configuring Cloud Feeds Only](#) | 983

Configuring Cloud Feeds Only

This is an outline of the configuration tasks you must complete to configure Cloud feeds only threat prevention.

NOTE: Since devices are not enrolled to Sky ATP in Cloud feed only mode, there is no information to display under Monitor > Threat Prevention, and therefore those screens are unavailable.

- A Sky ATP license and account are needed for the following (Sky ATP with SDSN, Sky ATP, and Cloud feeds only). If you do not have a Sky ATP license, contact your local sales office or Juniper Networks partner to place an order for a Sky ATP premium license. If you do not have a Sky ATP account, when you configure Sky ATP, you are redirected to the Sky ATP server to create one. Please obtain a license before you try to create a Sky ATP account. Refer to [“Obtaining a Sky ATP License” on page 878](#) for instructions on obtaining a Sky ATP premium license.
- Before you configure Cloud Feeds you must enter the IP address and login credentials for the policy enforcer virtual machine. Go to **Administration > Policy Enforcer > Settings**. Once this information is entered, you can begin the setup process. See [“Policy Enforcer Settings” on page 884](#). (Refer to [“Deploying and Configuring the Policy Enforcer with OVA files” on page 859](#) for instructions on downloading Policy Enforcer and creating your policy enforcer virtual machine.)

To configure Security Director for Cloud feed only threat prevention, do the following:

NOTE: Cloud feed only configuration is similar to Sky ATP (without SDSN) configuration. The only differences being that devices do not have to be enrolled to Sky ATP and the only threat prevention types available are command and control server and Geo IP.

1. Create one or more Sky ATP realms and add devices to the realm. (Note that devices do not have to be enrolled to Sky ATP for Cloud Feed only mode.)

In the UI, navigate to **Configure>Threat Prevention>Sky ATP Realms**. Click the + icon to add a new Sky ATP realm.

See [“Creating Sky ATP Realms and Enrolling Devices or Associating Sites” on page 692](#) for details.

2. Create sites and add devices to those sites.

In the UI, navigate to **Devices >Secure Fabric**. Click the + icon to create a new site.

See [“Creating Secure Fabric and Sites” on page 304](#) for details.

3. Create a policy enforcement group.

In the UI, navigate to **Configure>Shared Objects>Policy Enforcement Groups**. Click the + icon to create a new policy enforcement group.

See [“Creating Policy Enforcement Groups” on page 769](#) for details.

4. Create a threat prevention policy for Command and Control server, Geo IP, or Infected hosts.

In the UI, navigate to **Configure>Threat Prevention >Policy**. Click the + icon to create a new threat prevention policy.

See [“Creating Threat Prevention Policies” on page 671](#) for details.

5. Configure Geo IP settings for inclusion in a firewall policy. See [“Creating Geo IP Policies” on page 765](#).

You must select your Geo IP policy as the source and/or destination of a firewall rule before it can take effect. Navigate to **Configure > Firewall Policy > Policies**.

.

Secure Fabric Overview

Secure Fabric is a collection of sites which contain network devices (switches, routers, firewalls, and other security devices), used in policy enforcement groups. When threat prevention policies are applied to policy enforcement groups, the system automatically discovers to which sites those groups belong. This is how threat prevention is aggregated across your secure fabric.

- **Add Enforcement Points**—Click the **Add Enforcement Points** link to add Firewalls, Switches, and/or Connectors. There is a one-to-one mapping between devices with sites. If a device is mapped to a site, you cannot use the same device to map to a different site. The connector can be mapped to multiple sites. To filter by type, click the three vertical dots beside the search field and select the check box for the device type. See [“Creating Secure Fabric and Sites” on page 304](#) for more information.
- **Drag and Drop Enforcement Points**—From the main page, you can select enforcement points and drag them to other sites to include them there. When you drag, the enforcement point is disenrolled from the current site and gets enrolled to the new site where the enforcement point is dropped.

You can either have switches or a connector as enforcement points and not both. However, you can drag a switch and add to a site that already has a switch or SRX Series device.

[Table 129 on page 306](#) shows fields on the Secure Fabric page.

Table 319: Fields on the Secure Fabric Page

Field	Description
Site	Specifies the name of the secure fabric site.
Enforcement Points	<p>Specifies the enforcement points for that particular site, if enforcement points are already added. If not added, click Add Enforcement Points to add Firewalls, Switches, or Connectors as enforcement points.</p> <p>A firewall icon is shown against some of the devices to indicate that they are the perimeter firewalls.</p> <p>For connectors, if you hover over the enforcement point, a tool tip is shown listing the corresponding vSRX devices with IP addresses and descriptions.</p>
Model	Specifies the type of the enforcement point. For example, vSRX, QFX, Connector.
IP	Specifies the IP address of the enforcement point, if the enforcement point is available.
SKYATP Enroll Status	<p>Specifies the status of the SkyATP enrollment.</p> <p>The Success status with a warning symbol indicates that the device is enabled for cloud feeds only and there is no support for malware capability and enhanced mode. This field will be blank if the device fails to disenroll SkyATP.</p> <p>If the status is Failed, click Retry to enroll the device with Sky ATP again. You can hover over the Failed status to see the corresponding job details. The device enroll retry option is available only when the status is Failed.</p>
Last Updated	Specifies the date on which the Secure Fabric page was last updated.
Description	Specifies the description that you had entered at the time of creating a secure fabric site.

[Policy Enforcement Groups Overview | 771](#)
[Threat Prevention Policy Overview | 677](#)

Creating Secure Fabric and Sites

To access this page, click **Devices>Secure Fabric**.

You create sites within your secure fabric from the secure fabric page.

- Plan out your sites in advance. A site is a grouping of network devices, including firewalls and switches, that contribute to threat prevention.
- Keep in mind that when you create a site, you must identify the perimeter firewalls so you can enroll them with Sky ATP.
- If you want to enforce an infected host policy within the network, you must assign a switch to the site.
- Devices *cannot* belong to multiple sites.
- Switches and connectors *cannot* be added to the same site

To create a site within your secure fabric:

1. Select **Devices>Secure Fabric**.
2. Click the + icon.
3. Complete the configuration by using the guidelines in [Table 128 on page 305](#) below.
4. Click **OK**.
5. Create a new site and add an enforcement point to a site.

Table 320: Fields on the Create Site Page

Field	Description
Site	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.

WARNING: If you add certain SRX Series Devices to your Secure Fabric as enforcement points, you may see a warning that the device(s) must be reconfigured in enhanced mode and require a reboot. Here is a list of SRX models that may require rebooting for enhanced mode after being registered with Policy Enforcer/Sky ATP.

- SRX340
- SRX345
- SRX650
- SRX240h2
- SRX320
- SRX300
- SRX550

Creating Policy Enforcement Groups

To access this page, click **Configure>Shared Objects>Policy Enforcement Groups**.

You can create policy enforcement groups from the policy enforcement groups page.

- Know what type of endpoints you are including in your policy enforcement group: IP address/subnet, or location.
- Determine what endpoints you will add to the group based on how you will configure threat prevention according to location, users and applications, or threat risk.
- Keep in mind that endpoints *cannot* belong to multiple policy enforcement groups.

To create a policy enforcement group:

- 1. Select **Configure>Shared Objects>Policy Enforcement Groups**.
- 2. Click the + icon.
- 3. Complete the configuration by using the guidelines in the [Table 263 on page 770](#) below.
- 4. Click **OK**.

Table 321: Fields on the Policy Enforcement Group Page

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include only dashes and underscores; no spaces allowed; 32-character maximum.
Description	Enter a description; maximum length is 64 characters. You should make this description as useful as possible for all administrators.
Group Type	Select a group type from the available choices. IP Address/Subnet or Location.

Table 321: Fields on the Policy Enforcement Group Page (*continued*)

Field	Description
Connector IPs	<p>This field is available only if the Group Type field is IP Address/Subnet</p> <p>The subnets of all connectors added in the Connector page are dynamically listed in the Available column. If the Group Type is IP Address/Subnet, the subnets within the connector instances that have the threat remediation enabled are only listed.</p> <p>When using Junos Space, Policy Enforcer is able to dynamically discover subnets configured on Juniper switches. Policy Enforcer does not have the same insight with third-party devices. Therefore you can add subnets to your connector configuration and select them here. This allows you to selectively apply policies to those subnets.</p> <p>If you have not configured a connector, you will see only Junos Space subnets discovered by Policy Enforcer. If you have a connector configured, you can see the subnets of a connector in the Available column. Hover over subnets to view the description for these subnets entered during the connector creation. You will not see any description if it is not entered during creating a connector. The description will show “No description available” for subnets that come from Junos Space.</p> <p>The Available and Selected columns have filters listed with connectors or Space. You can choose a connector and filter only the subnets belonging to that particular connector. The result shows the name of a device to which the subnet belongs and also the type of the device.</p> <p>You can also use the search bar to search and filter the result based on subnet, name of the device, or type of the device.</p> <p>Click Refresh Available IPs to refresh the available IP addresses or subnets. If you edit any selected items in the Selected column, the list is refreshed to the initial selected list after the refresh. A progress bar is shown with the refresh progress in percentage.</p> <p>In a scenario where there are no IP addresses or subnets, the refresh will still be successful. A message is displayed showing that the refresh was successful but there are no IP addresses or subnets found.</p>
Additional IP	<p>This field is available only if the Group Type field is IP Address/Subnet</p> <p>Enter an IP address and select the connector type from the list to add to PEG. The IP address must be within the subnet range of the selected connector. Click Add to add the additional IP address to the Selected column of the Connector IPs field.</p> <p>A validation is performed to check if the additional IP address is within the subnet range of the selected connector. If not, an error message is shown to enter the IP address within the subnet range.</p>
Sites	<p>Sites with the threat remediation enabled instances are only listed, if the Group Type is Location. Select the check box beside the sites in the Available list and click the > icon to move them to the Selected list.</p> <p>The endpoints in the Selected list will be included in the policy enforcement group.</p>

You can create a policy enforcement group with subnets from different connectors based on how they have grouped their network segments. For example, If you have Junos Space EX switch with subnets HR: 1.1.1.1/24 and Finance: 2.2.2.2/24, ClearPass connector with subnets HR: 1.1.1.1/24 and Marketing: 2.2.2.2/24, Cisco ISE with subnets HR: 1.1.1.1/24 and Finance: 2.2.2.2/24. You can create a single policy enforcement group and name it as HR by choosing the following subnets: Junos Space EX HR: 1.1.1.1/24, ClearPass connector subnet HR: 1.1.1.1/24, and Cisco ISE connector subnet HR: 1.1.1.1/24.

[Using Guided Setup for Sky ATP with SDSN | 937](#)

Creating Custom Feeds: Dynamic Address, Whitelist and Blacklist

To access this page, click **Configure>Threat Prevention>Custom Feeds**.

You can create custom feeds from the custom feeds page.

- Know what type of feed you are configuring and have all the necessary information on hand. Local feeds are created on your local system and uploaded from there.
- To use a custom feed, apply it to the source or destination address in a firewall rule. In the firewall rule, you can filter addresses to show Dynamic Addresses.
- For creating an Infected Host custom feed, see [“Creating Custom Feeds, Infected Host” on page 706](#).

For creating a DDoS custom feed, see [“Creating Custom Feeds, DDoS” on page 709](#).

To create local file and remote file custom feeds:

1. Select **Configure>Threat Prevention>Custom Feeds**.
2. Select one of the following feed types.

Table 322: Custom Feed Categories

Feed Category	Definition
Dynamic Address	<p>A dynamic address entry provides dynamic IP address information to security policies. A dynamic address is a group of IP addresses, not just a single IP prefix, that can be imported from external sources. These IP addresses are for specific domains or for entities that have a common attribute such as a particular undesired location that poses a threat. You can then configure security policies to use the dynamic addresses within a security policy.</p> <p>You can use custom feeds while configuring the firewall policy. For information on how to create dynamic addresses, see: Creating Dynamic Address Groups.</p> <p>NOTE: You can create multiple custom feeds for all types of feed categories.</p>
Whitelist	<p>A whitelist contains known trusted IP addresses, URLs, and domains. Content downloaded from locations on the whitelist does not have to be inspected for malware.</p>
Blacklist	<p>A blacklist contains known untrusted IP addresses, URLs, and domains. Access to locations on the blacklist is blocked, and therefore no content can be downloaded from those sites.</p>
Infected Host	<p>Infected hosts are hosts known to be compromised. Enter host IP addresses manually or upload a text file with the IP addresses of infected hosts. See “Creating Custom Feeds, Infected Host” on page 706 for configuration details.</p>
DDoS	<p>Using DDoS threat feed, policy Enforcer blocks source IP addresses in the feed, rate limit the traffic from the source IP addresses, and takes BGP Flowspec action to blackhole or redirect the traffic to scrubbing centers. See “Creating Custom Feeds, DDoS” on page 709 and “Creating Threat Prevention Policies” on page 671.</p>

NOTE:

- The Remote Download Status field shows the status of downloading feeds from a remote file server to Policy Enforcer. This field will be blank if the locally created custom feeds.

The following statuses are shown under different scenarios:

- Pending—Status is shown as pending until Policy Enforcer downloads the new feeds from the remote file server.
- Success—Status is shown as success when Policy Enforcer downloads the feeds successfully.
- Failed—Status is shown as failed when downloading the feeds fails.
- The Days to Become Inactive field shows the number of days within which the custom feed is going to expire or become inactive. You must specify the number of days for each custom feed to be active in the Time to Live (TTL) Settings page. Whenever you make any update to a feed type in the TTL Settings page, number of days to expire is counted from that date. See [“Configuring TTL Settings for Custom Feeds” on page 712](#).

Once the Days to Become Inactive field is zero, the respective feed will become inactive and cannot be used. You must update the feed again to make it active.

3. Click **Create** and select one of the following:

- **Feeds with local files**—This is data you enter manually into the provided fields or upload from a text file on your location machine. See [Table 236 on page 701](#) for details.
- **Feeds with remote file server**—This is a data feed from a remote server. Configure communication with the remote server using instructions in [Table 237 on page 702](#).

4. Complete the configuration by using the guidelines in [Table 236 on page 701](#) or [Table 237 on page 702](#).

5. Click **OK**. Your entry is added to custom list displayed at the bottom of the page.

NOTE: To use a custom feed, apply it to the source or destination address in a firewall rule. In the firewall rule, you can filter addresses to show Dynamic Addresses.

If there is a firewall policy rule created using the dynamic address, you cannot delete the same dynamic address from the Custom Feeds page. You must first delete the firewall policy rule and then, delete the dynamic address from the Custom Feeds page.

Use the fields in [Table 236 on page 701](#) to add custom feeds.

Table 323: Fields on the Custom Feeds Page, Feeds with Local Files

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include only dashes and underscores; no spaces allowed; 32-character maximum.
Description	Enter a description for your custom feed; maximum length is 64 characters. You should make this description as useful as possible for all administrators.
Feed Type	<p>Select one of the following:</p> <ul style="list-style-type: none"> • IP, Subnet and Range—Enter an IPV4 address in standard four octet format. CIDR notation and IP address ranges are also accepted. Any of the following formats are valid: 1.2.3.4, 1.2.3.4/30, or 1.2.3.4-1.2.3.6. • URL and Domain—Enter the URL using the following format: http://yourfeed.com/abc and Domain using the following format: http://yourfeed.com. Wildcards and protocols are not valid entries. <p>NOTE: For Dynamic Address, you can only select IP, Subnet, and Range. For Blacklists and Whitelists, all feed types are available for selection.</p>
Sites	<p>Select the required sites from the list to associate them with the dynamic address or whitelists and blacklists feeds.</p> <p>In the default mode (no Sky ATP), only sites are listed because of no Sky ATP. The same site can be shared across dynamic address, whitelists, and blacklists feeds.</p>
Realms	<p>Select the required realms from the list, if you are in Cloud feeds only, Sky ATP, or Sky ATP with SDSN mode.</p> <p>Associate these realms with dynamic address or whitelists and blacklists feeds. The same realm can be shared across dynamic address, whitelists and blacklists feeds.</p> <p>When you are creating a Sky ATP realm, if you do not assign any sites to it, those realms are not listed here. Only realms with sites associated are listed here.</p>

Table 323: Fields on the Custom Feeds Page, Feeds with Local Files (*continued*)

Field	Description
Custom List	<p>Do one of the following:</p> <ul style="list-style-type: none"> Click Upload File to upload a text file with an IP address list. Click the Add button to include the address list in your custom list. <p>Note that the file must contain only one item per line (no commas or semi colons). All items are validated before being added to the custom list.</p> <p>The file must not contain more than 500 entries. An error message is shown if you try to upload a file containing more than 500 IP addresses. Use the Feeds with remote file server option to upload a file containing more than 500 IP addresses.</p> <ul style="list-style-type: none"> Manually enter your item in the space provided in the Custom List section. To add more items, click + to add more spaces.

Table 324: Fields on the Custom Feeds Page, Feeds with Remote File Server

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include only dashes and underscores; no spaces allowed; 32-character maximum.
Description	Enter a description for your custom feed; maximum length is 64 characters. You should make this description as useful as possible for all administrators.
Feed Type	<p>Select one of the following:</p> <ul style="list-style-type: none"> IP, Subnet and Range—Enter an IPV4 address in standard four octet format. CIDR notation and IP address ranges are also accepted. Any of the following formats are valid: 1.2.3.4, 1.2.3.4/30, or 1.2.3.4-1.2.3.6. URL and Domain—Enter the URL using the following format: http://yourfeed.com/abc and Domain using the following format: http://yourfeed.com. Wildcards and protocols are not valid entries. <p>NOTE: For Dynamic Address, you can only enter IP, Subnet, and Range. For Blacklists and Whitelists, all feed types are available for selection.</p>
Type of Server URL	<p>Select one of the following:</p> <ul style="list-style-type: none"> http https
Server File URL	Enter the URL for the remote file server.

Table 324: Fields on the Custom Feeds Page, Feeds with Remote File Server (continued)

Field	Description
Certificate Upload	<p>Click Browse and select the CA certificate to upload.</p> <p>If you do not upload a certificate for https server URL, a warning message is shown that a certificate is not uploaded and to whether proceed further or not. Click Yes to proceed further without uploading a certificate or No to go back and upload the certificate.</p>
Username	<p>Enter the credentials for the remote file server.</p> <p>This is not a mandatory field. You can still proceed to create a custom feed without entering the username.</p>
Password	<p>Enter the credentials for the remote file server.</p> <p>This is a mandatory field, if you have provided the username.</p>
Update Interval	<p>Select how often updates are retrieved from the remote files server: Hourly, Daily, Weekly, Monthly, Never</p>

[Sky ATP Realm Overview | 691](#)

Creating Custom Feeds, Infected Host

To access this page, click **Configure>Threat Prevention>Custom Feeds**.

- Note that infected hosts are hosts known to be compromised. For an infected host custom feed, enter host IP addresses manually or upload a text file with the IP addresses of infected hosts.
- If you create a custom infected hosts feed, it will override the SKY ATP infected hosts feed.
- To use a custom feed, apply it to the source or destination address in a firewall rule. In the firewall rule, you can filter addresses to show custom feed types, including infected hosts.

- Note that when Sky ATP only mode is selected as the Threat Prevention Type, the infected host custom feed is not available.
- For creating other custom feed types, see [“Creating Custom Feeds: Dynamic Address, Whitelist and Blacklist” on page 698](#).

WARNING: When you have no Sky ATP Configuration Type selected (No selection), Sky ATP realms are disabled. Because site selection is usually done from the Sky ATP realm page, you must select sites from the Custom Feed - Infected Hosts page when in “No selection” mode. The custom feeds are then downloaded to the devices in the chosen sites. This is the only time site selection is available in the Custom Feeds - Infected Hosts page.

To create local file and remote file custom feeds:

1. Select **Configure>Threat Prevention>Custom Feeds**.
2. Select the **Infected Host** tab.

NOTE: When Sky ATP only is selected as the Threat Prevention Type, the infected host custom feed is not available.

3. Click **Create** and select one of the following:
 - **Feeds with local files**—This is data you enter manually into the provided fields or upload from a text file on your location machine. See [Table 236 on page 701](#) for details.
 - **Feeds with remote file server**—This is a data feed from a remote server. Configure communication with the remote server using instructions in [Table 237 on page 702](#).
4. Complete the configuration by using the guidelines in [Table 236 on page 701](#) or [Table 237 on page 702](#).
5. Click **OK**. Your entry is added to custom list displayed at the bottom of the page.

NOTE: To use a custom feed, apply it to the source or destination address in a firewall rule. In the firewall rule, you can filter addresses to show Infected Hosts, Dynamic Addresses, Whitelists and Blacklists.

Use the fields in [Table 236 on page 701](#) to add custom feeds.

Table 325: Fields on the Custom Feeds Page, Feeds with Local Files

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include colons, periods, dashes, and underscores; no spaces allowed; 63-character maximum.
Description	Enter a description for your custom feed; maximum length is 1,024 characters. You should make this description as useful as possible for all administrators.
Sites	<p>Select the required sites from the list to associate them with the infected feeds.</p> <p>In the default mode (no Sky ATP), only sites are listed because of no Sky ATP. You cannot share the same site across the same feed type. However, you can share a site across different feed types.</p>
Realms	<p>Select the required realms from the list, if you are in Cloud feeds only, or SDSN with Sky ATP only mode and associate them with dynamic address or whitelists and blacklists feeds.</p> <p>You cannot share the same realm across the same feed type. However, you can share a realm across different feed types.</p> <p>When you are creating a Sky ATP realm, if you do not assign any sites it, those realms are not listed here. Only realms with sites associated are listed here.</p>
Custom List	<p>Do one of the following:</p> <ul style="list-style-type: none"> Click Upload File to upload a text file with an IP address list. The uploading file must have the string <i>add</i> at the beginning, followed by the IP addresses. If you want to delete certain IP addresses, enter the string <i>delete</i> followed by the IP addresses to delete. <p>Click the Add button to include the address list in your custom list.</p> <p>Note that the file must contain only one item per line (no commas or semi colons). All items are validated before being added to the custom list.</p> <ul style="list-style-type: none"> Manually enter your item in the space provided in the Custom List section. To add more items, click + to add more spaces. <p>For syntax, enter an IPV4 address in standard four octet format. CIDR notation and IP address ranges are also accepted. Any of the following formats are valid: 1.2.3.4, 1.2.3.4/30, or 1.2.3.4-1.2.3.6.</p>

Table 326: Fields on the Custom Feeds Page, Feeds with Remote File Server

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include colons, periods, dashes, and underscores; no spaces allowed; 63-character maximum.
Description	Enter a description for your custom feed; maximum length is 1,024 characters. You should make this description as useful as possible for all administrators.

Table 326: Fields on the Custom Feeds Page, Feeds with Remote File Server (continued)

Field	Description
Type of Server URL	Select one of the following: <ul style="list-style-type: none"> • http • https
Server File URL	Enter the URL for the remote file server.
Certificate Upload	Click Browse and select the CA certificate to upload. If you do not upload a certificate for https server URL, a warning message is shown that a certificate is not uploaded and to whether proceed further or not. Click Yes to proceed further without uploading a certificate or No to go back and upload the certificate.
Username	Enter the credentials for the remote file server.
Password	Enter the credentials for the remote file server.
Update Interval	Select how often updates are retrieved from the remote files server: Hourly, Daily, Weekly, Monthly, Never

You can create only a single infected host. If you want to create one more infected host, you must first delete the existing feed and create a new one.

If you try to disenroll a site in an infected host, a warning message is shown to resolve all the current infected hosts from the respective endpoints within a site. To resolve the infected hosts, log-in to Sky ATP UI, resolve the hosts, and then unassign sites from Policy Enforcer. Ensure that you always resolve the infected hosts before unassigning sites. Once you unassign sites, you cannot resolve the hosts.

Threat Prevention Policy Overview

Threat prevention policies provide protection and monitoring for selected threat profiles, including command and control servers, infected hosts, and malware. Using feeds from Sky ATP and optional custom feeds that you configure, ingress and egress traffic is monitored for suspicious content and behavior. Based on a threat score, detected threats are evaluated and action may be taken once a verdict is reached.

Once policies are configured, the following fields are available on the Security Director main page to provide an overview of each policy.

Table 327: Threat Prevention Policy Fields

Field	Description
Name	The user-created name for the policy.
Profile: C&C Server	Threat score settings overview if selected for the policy. (Otherwise this field is empty.) For example: Block: 8-10 Monitor: 5-7 Permit: 1-4
Profile: Infected Host	Threat score settings overview if selected for the policy. (Otherwise this field is empty.)
Profile: Malware HTTP	Threat score settings overview if selected for the policy. (Otherwise this is empty.)
Profile: Malware SMTP	Threat score settings overview if selected for the policy. (Otherwise this field is empty.)

Table 327: Threat Prevention Policy Fields (continued)

Field	Description
Status	<p>This displays the status of the policy. This status is a clickable link you can use to change the policy status. When you first create a policy and assign it to a group, this field reads View Analysis. Read “Threat Policy Analysis Overview” on page 679 for more information on this field.</p> <p>If the status is Update Failed, click Retry to perform the rule analysis again. You can click the Update Failed status to see the corresponding job details. The rule analysis retry option is available only when the status is Update Failed.</p> <p>NOTE: If the policy has been updated after it has already been pushed to the endpoint, the status here is Update with a warning icon to notify you the policy has been changed but not pushed.</p>
Policy Enforcement Group	This is the group to which the policy is assigned.
Log	This field displays the log setting for the policy.
Description	The user-created description for the policy.

Benefits of Threat Prevention Policy

- Enables you to define and enforce policies for controlling specific applications and embedded social networking widgets.
- Reduces the need for manual updates and automatically applies policies and enforcement rules, driving down the costs of managing network security.
- Leverages the network for multiple enforcement points across the infrastructure. Enables you to stop threats closer to infection points and to prevent threats from spreading, which greatly improves the efficacy of security operations.

Creating Threat Prevention Policies

To access this page, select **Configure>Threat Prevention > Policy**.

You can create threat prevention policies from the policy page.

NOTE: If you are creating policies for the first time, you are given the option of setting up Policy Enforcer with Sky ATP or configuring Sky ATP alone. Clicking either button takes you to quick setup for your selection. See [“Comparing the SDSN and non-SDSN Configuration Steps” on page 855](#) for a configuration comparison.

- Determine the type of profile you will use for this policy; command & control server, infected hosts, malware. You can select one or more threat profiles in a policy. Note that you configure Geo IP policies separately. See [“Creating Geo IP Policies” on page 765](#).
- Determine what action to take if a threat is found.
- Know what policy enforcement group you will add to this policy. To apply the policy, you must assign one or more policy enforcement groups. See the instructions for assigning groups to policies at the bottom of this page.
- Once policies are configured with one more groups assigned, you can save a policy in draft form or update it. Policies changes do not go live until they have been updated.
- If you are using Sky ATP without Policy Enforcer, you must assign your threat prevention policy to a firewall rule for it to take affect. See the instructions at the bottom of this page.
- If you delete a threat prevention policy that is assigned to a policy enforcement group, a status screen appears displaying the progress of the deletion and the affected configuration items.

To create a threat prevention policy:

1. Select **Configure>Threat Prevention > Policy**.
2. Click the + icon.

The Create Threat Prevention Policy page appears.

3. Complete the configuration by using the guidelines in the [Table 226 on page 672](#), [Table 227 on page 672](#), [Table 228 on page 673](#), [Table 229 on page 674](#), and [Table 230 on page 675](#) below.
4. Click **OK**.

Table 328: Fields on the Threat Prevention Policy Page

Field	Description
Name	Enter a unique string that must begin with an alphanumeric character and can include underscores; no spaces allowed; 63-character maximum.
Description	Enter a description; maximum length is 1024 characters. You should make this description as useful as possible for all administrators.
Log Setting (Policy setting for all profiles)	Select the log setting for the policy. You can log all traffic, log only blocked traffic, or log no traffic.

[Table 227 on page 672](#) shows the management of command and control server threat in a policy.

Table 329: C&C Server Profile Management

Field	Description
Command and Control Server	Select and choose settings for command and control servers. A C&C is a centralized computer that issues commands to botnets (compromised networks of computers) and receives reports back from them. Botnets can be used to gather sensitive information, such as account numbers or credit card information, or to participate in a distributed denial-of-service (DDoS) attack.
<i>Include C& C profile in policy</i>	Select the check box to include management for this threat type in the policy.
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. Refer to the monitoring pages in the UI to investigate, located under Monitor > Threat Management .
Actions	<p>If the threat score is high enough to cause a connection to be blocked, you have following configurable options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Close connection and do not send a message <ul style="list-style-type: none"> • Close connection and redirect to URL—In the field provided, enter a URL to redirect users to when connections are dropped. • Send custom message—In the field provided, enter a message to be shown to users when connections are dropped.

[Table 228 on page 673](#) shows the management of infected host threat in a policy.

Table 330: Infected Host Profile Management

Field	Description
Infected Host	Infected hosts are systems for which there is a high confidence that attackers have gained unauthorized access. Infected hosts data feeds are listed with the IP address or IP subnet of the host, along with a threat score.
<i>Include infected host profile in policy</i>	Select the check box to include management for this threat type in the policy. NOTE: If you want to enforce an infected host policy <i>within</i> the network, you must include a switch in the site.
Actions	You have following options: <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Quarantine—In the field provided, enter a VLAN to which quarantined files are sent. (Note that the fallback option is to block and drop the connection silently.)

[Table 229 on page 674](#) shows the management of malware threat in a policy.

Table 331: Malware Threat Profile Management

Field	Description
Malware (HTTP file download, SMTP File attachment, and IMAP attachments)	Malware is files that are downloaded by hosts or received as email attachments and found to be suspicious based on known signatures, URLs. or other heuristics.
<i>Include malware profile in policy</i>	Select the check box to include management for this threat type in the policy.
HTTP file download	Turn this feature on to scan files downloaded over HTTP and then select a file scanning device profile. The device profile is configured using Sky ATP.
Scan HTTPS	Turn this feature to scan encrypted files downloaded over HTTPS.
Device Profile	Select a Sky ATP device profile. This is configured through Sky ATP. Sky ATP profiles let you define which files to send to the cloud for inspection. You can group types of files to be scanned together under a common name and create multiple profiles based on the content you want scanned. <i>Device Profiles Overview</i> .

Table 331: Malware Threat Profile Management (*continued*)

Field	Description
Actions	<p>If the threat score is high enough to cause a connection to be blocked, you have following configurable options:</p> <ul style="list-style-type: none"> • Drop connection silently (This is the default and recommended setting.) • Close connection and do not send a message <ul style="list-style-type: none"> • Close connection and redirect to URL—In the field provided, enter a URL to redirect users to when connections are dropped. • Send custom message—In the field provided, enter a message to be shown to users when connections are dropped.
SMTP File Attachments	Turn this feature on to inspect files received as email attachments (over SMTP only).
Scan SMTPS	<p>Enable this option to configure reverse proxy for SMTP.</p> <p>The reverse proxy does not prohibit server certificates. It forwards the actual server certificate or chain as is to the client without modifying it.</p>
Device Profile	<p>If you do not click the Change button to select a device profile for SMTP scanning, the device profile selected for HTTP will be used by default.</p> <p>Select Change to use a different device profile for SMTP.</p> <p>Device profiles are configured through Sky ATP and define which files to send to the cloud for inspection.</p>
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. This threat score applies to all malware, HTTP and SMTP. (Note: There is no monitoring setting for malware.)
Actions	Actions for SMTP File Attachments include: Quarantine, Deliver malicious messages with warning headers added, and Permit. This actions are set in Sky ATP. Refer to the Sky ATP documentation for information.
IMAP Attachments	Turn this feature on to select a a file scanning device profile and threat score ranges to apply to IMAP e-mails.
Scan IMAPS	Enable this option to configure reverse proxy for IMAP e-mails.

Table 331: Malware Threat Profile Management (*continued*)

Field	Description
Device Profile	<p>If you do not click the Change button to select a device profile for IMAP scanning, the device profile selected for HTTP will be used by default.</p> <p>Select Change to use a different device profile for IMAP.</p> <p>Device profiles are configured through Sky ATP and define which files to send to the cloud for inspection.</p>
Actions	Actions for IMAP Attachments include: Block, Deliver malicious messages with warning headers added, and Permit. These actions are set in Sky ATP. Refer to the Sky ATP documentation for information.
Threat Score	Use the slider to change the action to be taken based on the threat score. Threat scores are assigned using several criteria. This threat score applies to all malware, HTTP, SMTP, and IMAP. (Note: There is no monitoring setting for malware.)

Table 230 on page 675 shows the management of DDoS threat in a policy

Table 332: DDoS Threat Profile Management

Field	Description
<i>Include DDoS Profile in Policy</i>	<p>Enable this option to include the management of Distributed denial-of-service (DDoS) protection that enables the MX router to quickly identify an attack and prevent a flood of malicious control packets from exhausting system resources.</p> <p>When you create a threat policy for the DDoS profile, it is not pushed to the device because the policy is not yet assigned to any device. Assign the policy to the policy enforcement group. Because the policy is created for the MX router, rule analysis is not initiated when a policy is assigned to the policy enforcement group (PEG).</p>
Actions	<p>Select the following actions from the list for the DDoS profile:</p> <ul style="list-style-type: none"> • Block—Use this option to block the DDoS attack. • Rate Limit Value—Use this option to limit the bandwidth on the flow route. You can express the rate limit value in Kbps, Mbps, or Gbps units. The rate limit range is 10Kbps to 100Gbps. • Forward to—Use this option to configure the routing next hop to forward the packets for scrubbing.
Scrubbing Site	Specify a routing instance to which packets are forwarded in the <i>as-number:community-value</i> format, where each value is a decimal number. For example, 65001:100.

Once you have a threat prevention policy, you assign one or more groups to it:

1. In the threat prevention policy main page (located under **Configure>Threat Prevention > Policy**), find the appropriate policy.
2. In the Groups column, click the **Assign to Groups** link that appears here when there are no policy enforcement groups assigned or click the group name that appears in this column to edit the existing list of assigned groups. You can also select the check box beside a policy and click the **Assign to Groups** button at the top of the page. See [“Policy Enforcement Groups Overview” on page 771](#) .
3. In the Assign to Groups page, select the check box beside a group in the Available list and click the > icon to move it to the Selected list. The groups in the Selected list will be assigned to the policy.
4. Click **OK**.
5. Once one or more policy enforcement groups have been assigned, a **Ready to Update** link appears in the Status column. You must update to apply your new or edited policy configuration. Clicking the Ready to Update link takes you the Threat Policy Analysis page. See [“Threat Policy Analysis Overview” on page 679](#). From there you can view your changes and choose to Update now, Update later, or Save them in draft form without updating.
6. If you are using Sky ATP without Policy Enforcer, you must assign your threat prevention policy to a firewall rule for it to take affect. Navigate to **Configure > Firewall Policy > Policies**. In the Advanced Security column, click an item to access the Edit Advanced Security page and select the threat prevention policy from the **Threat Prevention** pulldown list.

- [Spotlight Secure and Policy Enforcer Deployment Comparison | 1010](#)
- [License Requirements | 1010](#)
- [Sky ATP and Spotlight Secure Comparison Table | 1010](#)
- [Migrating Spotlight Secure to a Policy Enforcer Configuration Overview | 1012](#)
- [Installing Policy Enforcer | 1012](#)
- [Configuring Advanced Threat Prevention Features: Spotlight Secure/Policy Enforcer Comparison | 1018](#)

The Spotlight Secure Threat Intelligence Platform aggregates threat feeds from multiple sources to deliver open, consolidated, actionable intelligence to SRX Series Devices across an organization. This product is now superseded by the SDSN Policy Enforcer. The Juniper Software Defined Secure Network (SDSN) framework delivers enhanced security from external as well as internal attacks by leveraging both security as well as network devices as a coherent security system.

Policy Enforcer is an orchestration solution that orchestrates user intent policy enforcement for threat remediation as well as micro-segmentation across the entire network. This document talks about the logistics of migrating from Spotlight Secure to Policy Enforcer.

Spotlight Secure and Policy Enforcer with Sky ATP are two different platforms and therefore a direct migration of threat policies from Spotlight Secure to Policy Enforcer is not supported. Instead it is recommended that you remove Spotlight Connector from your Space Fabric and remove threat related configurations on Security Director before you install Policy Enforcer. Then you will need to reconfigure

your data and threat feeds. The following sections provide an overview of the transition process from Spotlight Secure to Policy Enforcer with Sky ATP.

Spotlight Secure and Policy Enforcer Deployment Comparison

The function of Spotlight Secure connector, to bring together all the available threat intelligence and make it available to security policies, is now done via Policy Enforcer with Sky ATP. In addition, Policy enforcer is a key part of the Software Defined Security Solution.

Spotlight Secure was installed to a separate virtual machine and then added as a specialized node to the Junos Space Fabric on Junos Space until version 15.1. Policy Enforcer is shipped as a virtual machine that is deployed independently. Instead of adding the new VM as a Junos Space node, the configuration has been simplified with a workflow using the Security Director user interface.

NOTE: Spotlight Secure supported a HA deployment. The current version of Policy Enforcer is supported only as a single stand-alone deployment.

License Requirements

For existing Spotlight Secure customers, no new additional license is needed. If you have a Spot-CC license, it can be used with Policy Enforcer and Sky ATP as well. A Policy Enforcer license would only be needed if you want to use the complete set of SDSN features with Sky ATP. SDSN/Policy Enforcer features includes all threat prevention types: C&C, infected hosts, malware, GeoIP, and policy management and deployment features such as secure fabric and threat prevention policies. See [“Features By Sky ATP Configuration Type” on page 853](#) for more details.

Sky ATP and Spotlight Secure Comparison Table

The following table provides a product comparison:

Table 333: SKY ATP and Spotlight support Quick Summary

Feature	Support in Spotlight Secure	Support with Policy Enforcer and Sky ATP	Workflow using Sky ATP, Security Director and Policy Enforcer
Command and Control Feed	Fully Supported	Fully Supported	<ul style="list-style-type: none"> • Create a Realm in Sky ATP if you do not already have one • Configure Policy Enforcer in Cloud feed only or Sky ATP or Sky ATP with SDN modes to connect to the realm • Configure a Threat Prevention Profile using Command and Control options • Use this Threat Prevention Profile in Firewall Policy
Custom Feeds	Blacklist, Whitelist and Dynamic Address features are fully supported.	Blacklist, Whitelist, Infected Host, and Dynamic Address features are fully supported	<ul style="list-style-type: none"> • Create a Realm in Sky ATP if you do not already have one • Configure Policy Enforcer Setting in Sky ATP mode • Create a Custom Feed using Blacklist, Whitelist or Dynamic address options selecting static IP or file options
Infected Host	Not directly supported by Spotlight. You must create custom feeds	Sky ATP supports an Infected Host feed, natively integrated with Policy Enforcer and Security Director.	Sky ATP supports an Infected Host feed, natively integrated with Policy Enforcer and Security Director.
Infected Host Remediation at the Access Network level	Not supported using Spotlight and Security Director	<p>Sky ATP supports an Infected Host feed which is natively integrated with Policy Enforcer. Policy Enforcer can take block/quarantine actions at the access network level.</p> <p>NOTE: This requires a Policy Enforcer license and does not come with a SPOT_CC license.</p>	Sky ATP supports an Infected Host feed which is natively integrated with Policy Enforcer. Policy Enforcer can take block/quarantine actions at the switch port level.

Migrating Spotlight Secure to a Policy Enforcer Configuration Overview

In this section, there is a side by side comparison of feature configuration for Spotlight Secure on Security Director 15.1 and Policy Enforcer on Security Director 16.1 and higher to aid in re-configuring your threat policies.

This is an overview of the tasks needed to migrate:

1. Document the current data and feed configuration from current version of Security Director.
2. Remove Spotlight Connector from your Junos Space Fabric and remove the threat prevention configuration.
3. Upgrade to the latest versions of Junos Space and Security Director.

NOTE: Since the underlying operation system is upgraded to Centos6.8 on Junos Space version 16.1, first upgrade Junos Space and applications to 15.2R2 and then follow the documentation to restore the database before deploying 16.1 or higher. Please refer to the [Junos Space 16.1 release notes](#) for details.

4. Deploy the Policy Enforcer virtual machine. See instructions in the following section.
5. Deploy Security Director and install Policy Enforcer to Security Director.
6. Configure a Sky ATP realm and enroll SRX Series devices into the realm. For all deployment models, it is necessary to configure a Sky realm and enroll firewalls.
7. Configure feeds and threat policies.

Installing Policy Enforcer

Policy Enforcer provides centralized, integrated management of all your security devices (both physical and virtual), allowing you to combine threat intelligence from different solutions and act on that intelligence from one management point. Using Policy Enforcer and the intelligence feeds it offers through Sky ATP, you can create threat prevention policies that provide monitoring and actionable intelligence for threat types such as known malware, command and control servers, infected hosts, and Geo IP-based server data.

Policy enforcer is shipped as a OVA file that should be deployed over VMware ESX.

1. Download the Policy Enforcer virtual machine OVA image from the Juniper Networks software [download page](#). It is recommended to deploy Policy Enforcer on the same ESX server as Junos Space.

NOTE: Do not change the name of the Policy Enforcer virtual machine image file that you download from the Juniper Networks support site. If you change the name of the image file, the creation of the Policy Enforcer virtual machine can fail.

Figure 129: Deploy Policy Enforcer OVF File 1

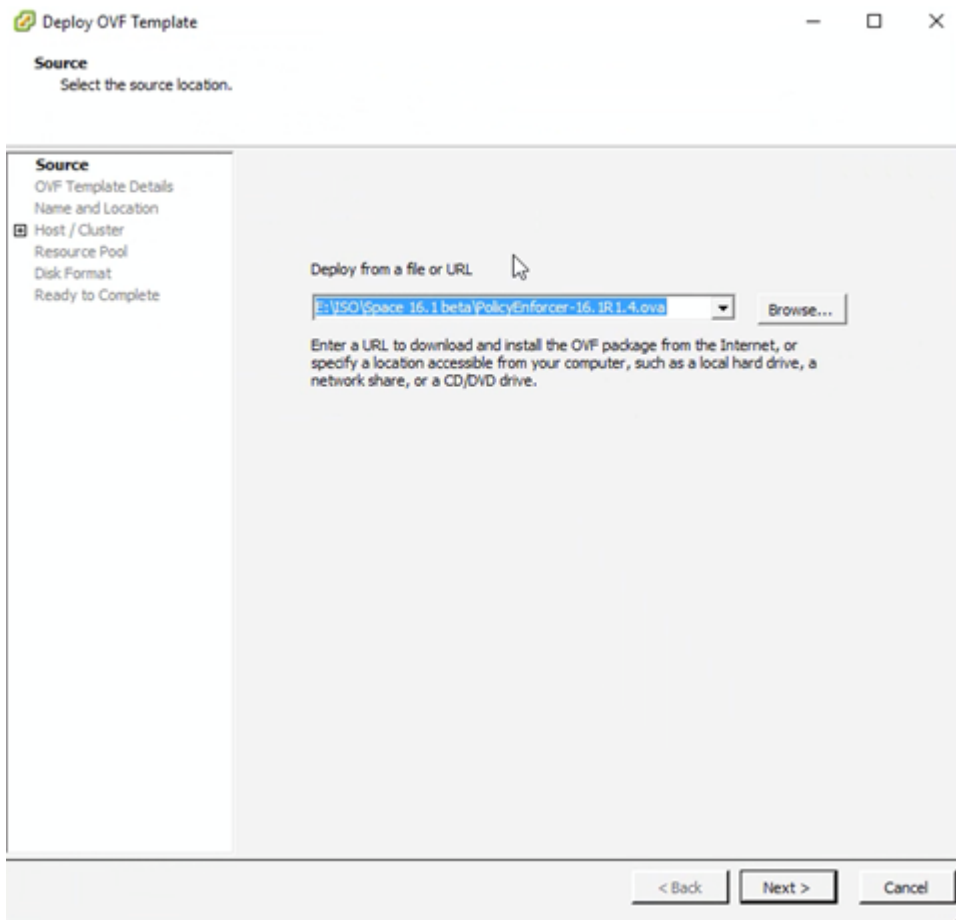

Figure 130: Deploy Policy Enforcer OVF File 2

NOTE: See [“Deploying and Configuring the Policy Enforcer with OVA files”](#) on page 859 for the complete Policy Enforcer installation documentation.

2. Initial configuration is done through the console. In addition to network and host configuration, you must set a customer ID and reset the root password. The default login to Policy Enforcer is Username: **root**, Password: **abc123**

Figure 131: Policy Enforcer Configuration Summary

3. Once Policy Enforcer is deployed, it must be added to Security Director via Security Director User Interface. From the Security Director UI, navigate to **Administration > Policy Enforcer > Settings**.

NOTE: Unlike Spotlight Secure, Policy Enforcer does not need to be added to Junos Space Fabric. The addition is done only through the Security Director UI.

4. On the Settings page, there three Sky ATP Configuration Types to choose from.
 - Sky ATP with SDSN—All Policy Enforcer features and threat prevention types are available
 - Sky ATP—All threat prevention types are available: Command and control server, Geo IP, and Infected hosts.
 - Cloud feeds only—Command and control server and Geo IP are the only threat prevention types available.
 - No selection (No Sky ATP)—You can choose to make no selection. When you make no selection, there are no feeds available from Sky ATP, but the benefits of Secure Fabric, Policy Enforcement Groups, and Threat Prevention policies provided by Policy Enforcer are available. Infected hosts is the only prevention type available

NOTE: You can switch from Cloud feeds only to Sky ATP, or SKY ATP to SKY ATP with SDSN, but the reverse is not supported.

NOTE: If you upgrade from Cloud feeds only to Sky ATP, you cannot roll back again. Upgrading resets all devices previously participating in threat prevention, and you must re-enroll them with Sky ATP. This is true for upgrading from Sky ATP to SKY ATP with SDSN. “SKY ATP with SDSN” is for the SDSN solution and not covered in this section.

NOTE: See [“Sky ATP Configuration Type Overview”](#) on page 850 for the Policy Enforcer documentation on this topic.

NOTE: Policy Enforcer with Sky ATP does not support a workflow for removing Policy Enforcer. To switch to a different Policy Enforcer, replace the IP and login information in the Policy Enforcer settings page.

Configuring Advanced Threat Prevention Features: Spotlight Secure/Policy Enforcer Comparison

The following section is a side by side comparison of how advanced threat prevention features were configured on Spotlight Secure compared to how they are configured with Policy Enforcer.

Configuring Command and Control and Infected Host

Spotlight Secure: C&C and Infected Host

This is how C&C and infected host feeds were configured on Security Director 15.1 with Spotlight Secure:

1. Under **Security intelligence > Information Source**, click + to add a new information source. Select **Spotlight Secure Cloud** as source.

Figure 132: Spotlight Secure: Add Information Source

2. Create a Security Intelligence profile from **Security intelligence > Profiles**. Choose **Command and Control** as the feed category and set the Blocking threshold. Configure Block Options and Logging.

Figure 133: Spotlight Secure: Create Security Intelligence Profile

Create Security Intelligence Profile

Name: Prad1

Description:

Feed Category: Command & Control

Blocking Threshold: Recommended Custom None

Custom allows you to block traffic based on the Threat Score.

Most aggressive

Default Security

- Provides the best balance between increased security and reduced false positives.
- Block malicious or suspicious traffic with a threat score of 8 or higher.

Least aggressive

Block Options: For all the blocked traffic, take the following action:

☒ Drop connection silently (recommended)

☐ Close connection

Create Cancel

3. Complete the workflow to create a profile.

Figure 134: Spotlight Secure: Create Profile

Profile Name	Domains	Feed Category	Threshold Summary	Address List	Description
Global White List	Global	Custom Address List			This global profile applies to all Security Intelligence Policies and can be used as a white list, permitting traffic and taking priority over the actions of other profiles.
Global Black List	Global	Custom Address List			This global profile applies to all Security Intelligence Policies and can be used as a black list, blocking traffic and taking priority over the actions of other profiles.
Prad1	Global	Command & Control	Block Threshold Type: Custom Threat Level Block Threshold Level: 7 Block Option: Drop connections silently Log Option: Log all traffic		

4. Create a security intelligence policy.

Figure 135: Spotlight Secure: Create Security Intelligence Policy

5. Apply the security intelligence policy to a firewall policy.

Figure 136: Spotlight Secure: Apply Security Intelligence Policy to Firewall Policy

Policy Enforcer with Sky ATP: C&C and Infected Host

This is how C&C and infected host feeds are configured on Security Director 16.1 and higher with Policy Enforcer:

NOTE: Policy Enforcer can be configured with Sky ATP or Cloud feeds only to enable Command and Control feeds. The following instructions are for Cloud feeds only.

NOTE: In addition to the instructions provided here, Threat Prevention Guided Setup under **Configuration > Guided Setup > Threat Prevention** can be leveraged for a wizard driven workflow.

1. Configure a Sky ATP Realm by navigating to **Configure > Threat Prevention > Sky ATP Realms**. Click **+** to create a realm.

(You must have a Sky ATP account to configure a realm. If you do not have an account please click on the link provided in the Sky ATP Realm window to create one at the Sky ATP account page. See [“Creating Sky ATP Realms and Enrolling Devices or Associating Sites” on page 692](#) for details).

NOTE: You do not need a Sky ATP premium license to create an account or realm.

2. Once the Sky ATP realm is created, add a policy by navigating to **Configure > Threat Prevention > Policies**. Click **+** to create a policy. Enable the check box to **Include C&C profile in policy** and set threat score thresholds, actions, and logging.

Figure 137: Policy Enforcer: Create Threat Prevention Policy

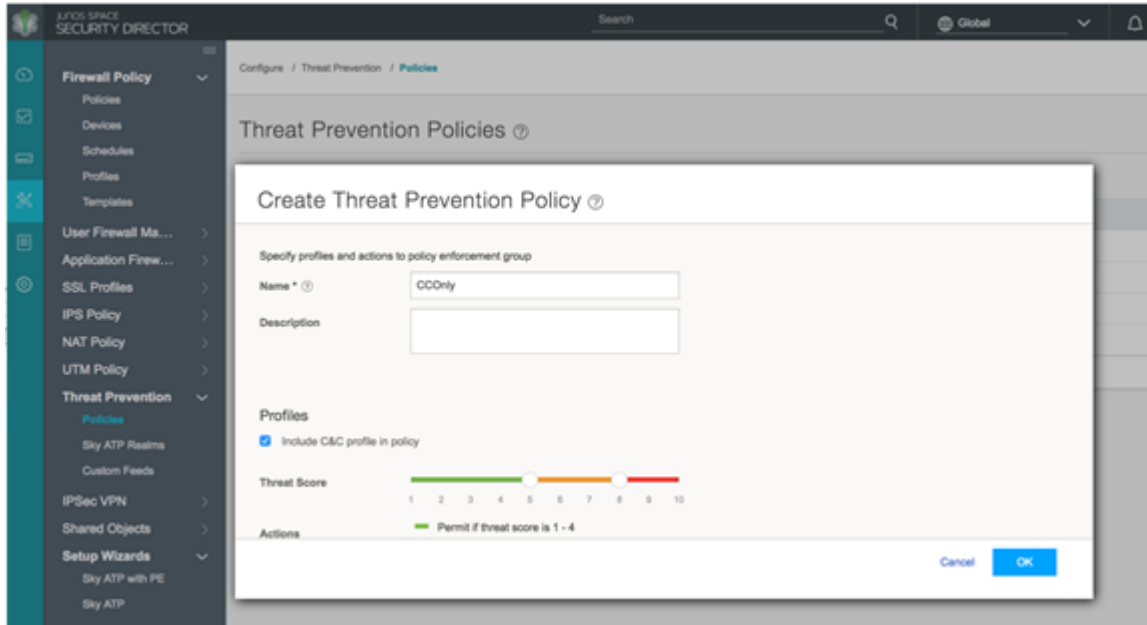

Figure 138: Policy Enforcer: Create Threat Prevention Policy, Select Threat Score and Logging

3. Apply the threat prevention policy to a firewall policy.

Figure 139: Policy Enforcer: Apply Threat Prevention Policy to Firewall Policy

4. Publish, verify the configuration and update to the firewall.

Figure 140: Policy Enforcer: Update Firewall Policy

NOTE: If Sky ATP is chosen as the Sky ATP Configuration Type under **Administration > Policy Enforcer > Settings**, the workflow remains the same, but additional parameters become available for configuring anti-malware.

Configuring Custom Feeds

Spotlight Secure: Custom Feeds

This is how custom feeds were configured on Security Director 15.1 with Spotlight Secure:

1. Create an information source by navigating to **Security Intelligence > Information Source**. Click + to add a source. (Note that WebApp Secure is no longer supported.)

Figure 141: Spotlight Secure: Add Information Source

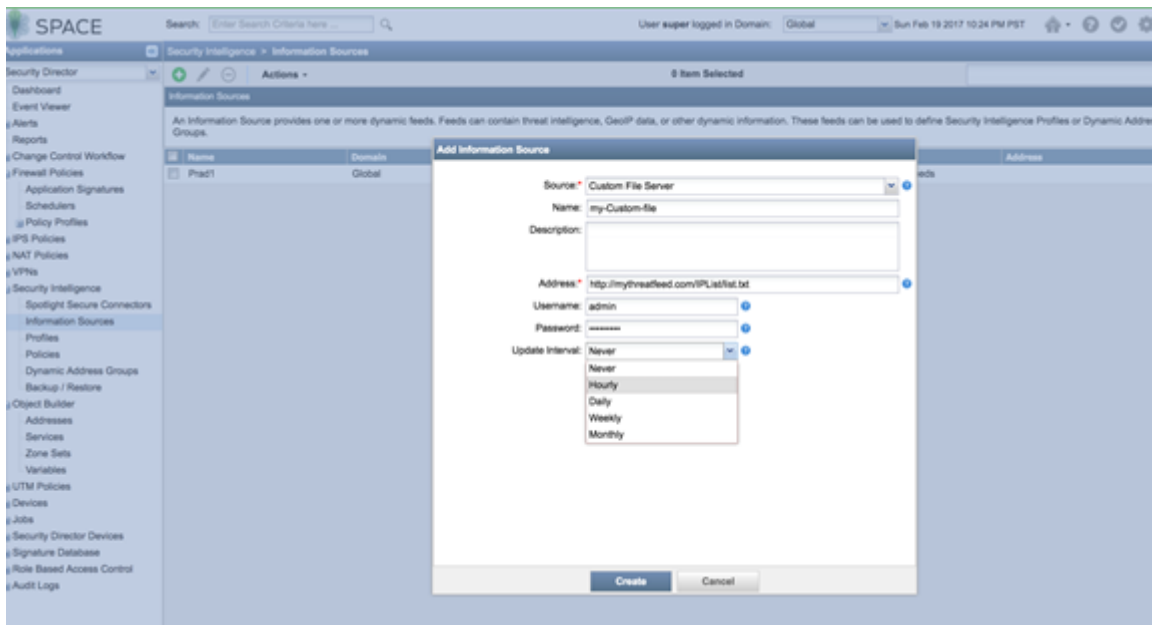

2. Upload from a custom file. Select **Source** as **Custom File Upload** and point to a local file.

Figure 142: Spotlight Secure: Configure Custom File Upload

3. Configure a periodic upload from a remote file server. Provide the full URL to the plain text file you want to poll and enter server login information, **Username** and **Password**.

Figure 143: Spotlight Secure: Enter Server Login for Custom File Upload

4. Create a dynamic object by navigating to **Security Intelligence > Dynamic Address Group**. Configure the feed as the custom feed that was created in the previous step.

Figure 144: Spotlight Secure: Select Custom Feed in Dynamic Address Group

5. Use the dynamic object in a security policy.

Figure 145: Spotlight Secure: Select Dynamic Address in Security Policy

- Configure a custom feed as a whitelist or blacklist by navigating to **Security Intelligence > Profiles**. Edit **Global White List** or **Global Back List** to add a custom feed created in the previous steps.

Figure 146: Spotlight Secure: Edit Global Whitelist or Blacklist

Policy Enforcer with Sky ATP: Custom Feeds

This is how custom feeds are configured on Security Director 16.1 and higher with Policy Enforcer:

NOTE: In addition to the instructions provided here, Threat Prevention Guided Setup under **Configuration > Guided Setup > Threat Prevention** can be leveraged for a wizard driven workflow.

Policy Enforcer supports manually adding or uploading custom feed information from a file server. The custom feed can be a dynamic object, infected hosts list, whitelist or blacklist which can then be used within the match criteria of a firewall rule.

1. Create Custom Feeds by navigating to **Configure > Threat Prevention > Custom Feeds**. Click + to create a new feed.
2. Provide a Name and Description for the custom feed and choose the tab for the type of feed: **Dynamic Address**, **Blacklist**, **Whitelist** or **Infected Host**.

Figure 147: Policy Enforcer: Configure Custom Feed

3. Manually configure the IP list or upload it from a local file. The IP list can be defined as individual IP addresses, IP address ranges, or subnets. See [“Creating Custom Feeds: Dynamic Address, Whitelist and Blacklist”](#) on page 698 for complete details.

NOTE: Dynamic objects can be used within a firewall policy to match criteria as a source or destination address object.

NOTE: Policy Enforcer supports only cloud based C&C feeds and not custom C&C feeds. Policy Enforcer APIs can be used to extend this functionality.

4. Upload a local file. Select the **Upload file** option in the right corner of the page.

Figure 148: Policy Enforcer: Upload Custom File

5. If you have configured a whitelist, downloads from those IP addresses are considered trusted. For blacklists, all downloads from those IP addresses are blocked. Dynamic objects can be used within a firewall policy match criteria as a source or destination address object.

Figure 149: Policy Enforcer: Use Dynamic Addresses in Firewall Policy

Configuring Geo IP

Spotlight Secure: Geo IP

This is how Geo IP feeds were configured on Security Director 15.1 with Spotlight Secure:

1. Create a GeoIP object under dynamic object by navigating to **Security Intelligence > Dynamic Address Group**. Select the feed as **GeoIP** and pick the countries from the drop down list.

Figure 150: Spotlight Secure: Create Geo IP with Dynamic Address Group

2. Use the Geo IP object in a firewall policy.

Figure 151: Spotlight Secure: Use Geo IP in Firewall Policy

Policy Enforcer with Sky ATP: Geo IP

This is how Geo IP feeds are configured on Security Director 16.1 and higher with Policy Enforcer:

1. Define GeoIP objects that can then be used within the match criteria of a firewall policy by navigating to **Configure > Shared Objects > Geo IP**. Create a Geo IP feed and choose countries to include from the list.(This feature requires a SecIntel or SKY ATP license.)

Figure 152: Policy Enforcer: Create Geo IP

2. Use the Geo IP feed you created as the source or destination address in a firewall policy.

Figure 153: Policy Enforcer: Use Geo IP in the Firewall Policy

Creating Log Report Definitions

Use this page to create log report definitions. Log-based reports help you to schedule reports based on default reports and default filters defined. You can also generate reports with different data criteria, including filters, aggregation criteria, and time range.

Before You Begin

- Read the [“Reports Overview” on page 1044](#) topic.
- Review the Reports main page for an understanding of your current data set. See [“Performing Different Actions on Reports” on page 1048](#) for field descriptions.

To configure a log report definition:

1. Select **Report > Report Definitions**.
2. Click **Create** and then select **Log Report Definition**.

3. Complete the configuration according to the guidelines provided in the [Table 334 on page 1037](#).
4. Click **Preview as PDF** to review the configuration.
5. Click **OK** to save the report definition.
6. Click **Send Report Now** to send the report through e-mail to the recipient immediately.

A new log report definition with the defined configurations is created. You can use the created policy definition to identify the issues with the firewall rules.

Table 334: Log Report Definition Settings

Settings	Guidelines
<i>General Information</i>	
Report Name	Enter a unique name for the report definition that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters
Description	Enter a description for the report definition; maximum length is 1024 characters.
<i>Content</i>	
Use Data Criteria from Filters	<p>Click Use Data Criteria from Filters.</p> <p>Select the data criteria from the list of default and user-created filters that are saved from the Events and Logs page.</p> <p>The details of the filters displayed are:</p> <ul style="list-style-type: none"> • Filter Name—Name of the filter. • Filter Description—Description of the filter. • Group By—Selected group by option. • Time Span—Duration for which the data is displayed. • Filter By—List of default and user-created filters. <p>NOTE: The default time stamp value is last 3 hours.</p>
<i>Schedule</i>

Creating Policy Analysis Report Definitions

Use the Reports page to create policy analysis report definitions. Policy analysis reports help you to analyze the firewall rule base for policies managed by Security Director. These reports also identify the firewall rules that contain issues.

Before You Begin

- Read the [“Reports Overview” on page 1044](#) topic.
- Review the Reports main page for an understanding of your current data set. See [“Report Definition Main Page Fields” on page 1050](#) for field descriptions.

Configuring Policy Analysis Report Definitions

To configure a policy analysis report definition:

1. Select **Reports > Report Definitions**.
2. Click **Create** and then select **Policy Analysis Report Definition**.
3. Complete the configuration according to the guidelines provided in the [Table 335 on page 1039](#).
4. Click **OK** to save the report definition.
5. Click **Preview as PDF** to review the configuration.
6. Click **Send Report Now** to send the report through e-mail to the recipient immediately.

A new policy analysis report definition with the defined configurations is created. You can use the created policy definition to identify the issues with the firewall rules.

Table 335: Policy Analysis Report Definition Settings

Settings	Guidelines
<i>General Information</i>	
Report Name	Enter a unique name for the report definition that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters.
Description	Enter a description for the report definition; maximum length is 1024 characters.

Creating Bandwidth Report Definitions

Use the Reports page to create bandwidth analysis report definitions. Bandwidth reports helps in analyzing the bandwidth usage of an application or an user. It gives you important information on bandwidth usage and helps you in identifying top applications and top users consuming more bandwidth.

Before You Begin

- Read the [“Reports Overview” on page 1044](#) topic.
- Review the Reports main page for an understanding of your current data set. See [“Report Definition Main Page Fields” on page 1050](#) for field descriptions.

Configuring Bandwidth Report Definitions

To configure a bandwidth analysis report definition:

- 1. Select **Reports> Report Definitions**.
- 2. Click **Create** and then select **Bandwidth Report Definition**.
- 3. Complete the configuration according to the guidelines provided in the [Table 336 on page 1042](#).
- 4. Click **Preview as PDF** to review the configuration.
- 5. Click **OK** to save the report definition.
- 6. Click **Send Report Now** to send the report through e-mail to the recipient immediately.

A new bandwidth analysis report definition with the defined configurations is created. You can use the created policy definition to identify the issues with the bandwidth usage.

Reports Overview

Reports are generated based on a summary of network activity and overall network status. These generated reports can help you to perform a trend analysis of your network's activities to study changes in traffic patterns. You can use the predefined reports as is, or you can build custom reports that meet specific needs.

Using reports, you can:

- Schedule reports based on the defined filters.
- Schedule reports based on the available default reports.
- Generate daily, weekly, and monthly reports, and send e-mail notifications to defined recipients.
- Generate reports with multiple sections, each section having its own criterion.

For example, if you are an administrator, you can schedule reports on a daily, weekly, or monthly basis, and configure them to include multiple criteria. You can also personalize the reports by adding your company logo, cover page, header, footer, and so on.

A Juniper Networks branded cover page is the default cover sheet of the reports. It contains the report title, name, and date of report creation. You can provide your company logo on the cover page along with the Juniper Networks logo. You can also provide the text for the footer and the logo for the header. If you do not provide the header and footer, the Juniper Networks branded header and footer are used. The generated report includes Table of Contents (TOC) with links to each section of the report. When the system generates a report, you and other designated recipients receive the report in PDF format through e-mail.

Using Reports

Reports are generated based on a summary of network activity and overall network status. These generated reports can help you to perform a trend analysis of your network's activities to study changes in traffic patterns. You can use the predefined reports as is, or you can build custom reports that meet specific needs.

Using reports, you can:

- Schedule reports based on the defined filters.
- Schedule reports based on the available default reports.
- Generate daily, weekly, and monthly reports, and send e-mail notifications to defined recipients.
- Generate reports with multiple sections, each section having its own criterion.

For example, If you are an administrator, you can schedule reports on a daily, weekly, or monthly basis, and configure them to include multiple criteria. You can also personalize the reports by adding your company logo, cover page, header, footer, and so on.

A Juniper Networks branded cover page is the default cover sheet reports. It contains the report title, name, and date of report creation. You can provide your company logo on the cover page along with the Juniper Networks logo. You can also provide the text for the footer and the logo for the header. If you do not provide the header and footer, the Juniper Networks branded header and footer are used. The generated report includes Table of Contents (TOC) with links to each section of the report. When the system generates a report, you and other designated recipients receive the report in PDF format through e-mail.

Logging

Logs, also called event logs, provide vital information for managing network security incident investigation and response. Logging provides the following features:

- Receives events from SRX Series devices and application logs.
- Stores events for a defined period of time or a set volume of data.
- Parses and indexes logs to help speed up searching.
- Provides queries and helps in data analysis and historical events investigation.

Using Report Definitions

You can use the Report Definitions page to view a summary of network activity and overall network status. You can use the predefined reports as is, or you can build custom reports.

To use report definitions:

1. Select **Reports > Report Definitions**.

The Report Definitions page is displayed.

2. Click a column header. The available options are:

- Sort Ascending—Sorts reports in ascending order; for example, A to Z or 1 to 10.
- Sort Descending—Sorts reports in descending order; for example Z to A or 10 to 1.
- Show or Hide Columns—Provides a list of columns with check boxes to add or remove columns from the report definitions table. [Table 337 on page 1046](#) lists the columns that you can add to the table or remove from the table.
- Check boxes—Each row has a check box. Select the check box to perform operations like, run now, preview as PDF, send report, edit recipients, edit schedule, clone, edit the report definitions, and delete the report definitions.

By default, some predefined reports are available.

Table 337: Report Definitions Columns

Field	Description
Name	Name of the report (user-created or predefined).
Description	Description of the report definition.
Type	Type of report definition used such as log reports, bandwidth report, or policy analysis reports.
Report Content	Details of the sections in the report such as Top Applications, Top Applications Blocked, Top Roles, and so on.
Schedule	Report generation schedule such as daily, weekly, or monthly.
Recipients	Recipients of the generated reports.

Table 337: Report Definitions Columns (*continued*)

Field	Description
Last Generated	Time when the last report was generated, along with the status.
Job ID	Job ID of the report.

Deleting Report Definitions

You can clear all unwanted report definitions that are not used anywhere in your network.

To delete a report definition:

1. Select **Reports > Report Definitions**.

The report definitions page appears.

2. Select the report definition that you want to delete, and then select the (-) minus sign. An alert message appears verifying that you want to delete your selection.

3. Click **Yes** to delete your selection.

The delete report notification is displayed.

4. Click **OK**.

NOTE: An error message appears if the report definition is used by any object.

Performing Different Actions on Reports

You can perform various actions on reports such as run a report immediately, edit a schedule, edit e-mail recipients, preview a report in PDF, send reports, clone reports, and view report definition details.

To perform these actions on the report:

1. Select **Reports > Report Definitions**.
2. Select the report definition and then right-click the report definition or click the **More** drop-down list.
3. Select the appropriate action from the drop-down list:
 - **Run Now**—Starting in Junos Space Security Director Release 16.1, you can select the **Run Now** option that runs the report immediately and provides a link to view the report in PDF. You can view the archived reports by clicking the **Generated Reports** link on the left navigation pane.
This option is also available as the **Run Now** button on the Report Definitions page.
 - **Preview as PDF**—Provides the PDF preview of the report.
 - **Send Report**—Sends the report through e-mail to the recipient immediately. The user receives a notification once the report is sent. The user can also use the job ID to see more details of the job.
 - **Edit Schedule**—Allows user to edit the schedule such as adding a recurrence, start date, end date, and time.
 - **Edit Recipients**—Allows user to edit or add the recipients, e-mail address, subject, and comments.
 - **Clone**— Allows the user to clone an existing report definition.
 - **Detailed View**—Starting in Junos Space Security Director Release 16.2, you can view the report name, description, report content type, report definition type, and its contents in Report Definition Details page.

You can also click the icon next to Name in the Report Definitions page to view the Report Definitions Details page.

Release History Table

Release	Description
16.2	Starting in Junos Space Security Director Release 16.2, you can view the report name, description, report content type, report definition type, and its contents in Report Definition Details page.
16.1	Run Now—Starting in Junos Space Security Director Release 16.1, you can select the Run Now option that runs the report immediately and provides a link to view the report in PDF. You can view the archived reports by clicking the Generated Reports link on the left navigation pane.

Report Definition Main Page Fields

Use this page to get an overall, high-level view of your report definition settings. You can filter and sort this information to get a better understanding of what you want to configure. [Table 338 on page 1050](#) describes the fields on the Report Definitions page and [Table 339 on page 1051](#) describes the predefined report definitions.

Table 338: Report Definition Main Page Fields

Field	Description
Name	Name of the report (user-created or predefined).
Description	Description of the report definition.
Definition Type	Predefined report or Custom report.
Type	Type of report definition used such as log reports, bandwidth report, or policy analysis reports.
Report Content	Details of the sections in the report such as Top Applications, Top Applications Blocked, Top Roles, and so on.
Schedule	Report generation schedule such as daily, weekly, or monthly.
Recipients	Recipients of the generated reports.
Last Generated	Time when the last report was generated, along with the status.
Job ID	Job ID of the report.

NOTE:

- Starting in Junos Space Security Director Release 17.1, Antivirus, URL Report, Application and User Usage, IPS Threat Environment, and Threat Report predefined report definitions are added.
- Starting in Junos Space Security Director Release 16.2, IPS Report predefined report definition is added, which displays consolidated report of all IPS events.
- Starting in Junos Space Security Director Release 16.1, Top Destination Countries and Top Source Countries predefined report definitions are added.
- Starting in Junos Space Security Director Release 15.2, Top Firewall Rules and Top Encrypted Applications predefined report definitions are added.

Table 339: Predefined Report Definitions

Name	Description
Top Firewall Service Deny	Displays report on top firewall service deny.
Top Services Detected	Displays report on top services detected in system by firewall.
Top Applications Blocked	Displays reports on top applications blocked.
Top Firewall Rules	Displays report on top firewall generating logs.
Top Source IPs	Displays report on top source IP addresses by count.
Top Source Countries	Displays report on top source IP addresses by countries.
Top Roles	Displays reports on top roles by count.
Top Destination Countries	Displays report on top destinations IP addresses by countries.
Top URLs Detected	Displays report on top URLs detected.
Top Firewall Deny Sources	Displays report on top firewall deny sources IP addresses.
Top SECINTEL and AAMW events	Displays report on top security intelligence and AAMW events.
Top Destination IPs	Displays report on top destination IP addresses by count.
Top Encrypted Applications	Displays report on top applications that are using encryption.

Table 339: Predefined Report Definitions (*continued*)

Name	Description
Top Web Apps	Displays reports on top Web applications by count.
Top Firewall Events	Displays report on top firewall events by count.
Top Anti Spam Detected	Displays report on top antispam detected.
Top Firewall Deny Destinations	Displays report on top firewall deny destinations IP addresses.
IPS Report	Displays a consolidated report on all IPS events statistics.
Antivirus	Displays a consolidated report on all antivirus events statistics.
URL Report	Displays a consolidated report on all URL events statistics.
Application and User Usage	Displays a report on the bandwidth usage statistics by application and user.
IPS Threat Environment	Displays a consolidated report on all IPS threat events.
Threat Report	Displays the statistics related to top threats identified through IDP, Antivirus, Antispam, Screen, and Device Authentication failure events.

Release History Table

Release	Description
17.1	Starting in Junos Space Security Director Release 17.1, Antivirus, URL Report, Application and User Usage, IPS Threat Environment, and Threat Report predefined report definitions are added.
16.2	Starting in Junos Space Security Director Release 16.2, IPS Report predefined report definition is added, which displays consolidated report of all IPS events.
16.1	Starting in Junos Space Security Director Release 16.1, Top Destination Countries and Top Source Countries predefined report definitions are added.
15.2	Starting in Junos Space Security Director Release 15.2, Top Firewall Rules and Top Encrypted Applications predefined report definitions are added.

Modifying Your User Profile in Security Director

Use the My Profile page to modify some details of your user profile.

User accounts are created by the administrator and the My Profile page lets you modify some details of your user profile.

Before You Begin

- Read the [“Overview of Users in Security Director” on page 1058](#) topic.

Modifying the User Profile

To modify the user profile:

1. Select **Administration > My Profile** or, in the Utility bar, click the arrow next to the username and select **My Profile**.

The My Profile page appears.

2. Modify your user profile according to the guidelines provided in [Table 340 on page 1055](#).

3. Click **OK**.

Your modifications are saved and a confirmation message is displayed.

Table 340: My Profile Settings

Overview of Users in Security Director

Junos Space Security Director supports the authentication and authorization of users. A Junos Space Super Administrator or User Administrator creates users and assigns roles to the users so that they can access and manage users, devices, services, and so on. To access and manage Junos Space Security Director, a user must be assigned one or more roles, which are validated during authorization.

Users receive permission to perform tasks only through the roles that they are assigned. In most cases, a single role assignment enables a user to view and to perform tasks on the objects within a workspace. For example, a user assigned the Device Manager role can discover devices, resynchronize devices, view the physical inventory and interfaces for devices, and delete managed devices. A user that is assigned the User Administrator role can create, modify, and delete other users in Junos Space, and perform actions, like creating, modifying, deleting, and so on, specific to roles, domains, and remote profiles.

Junos Space is shipped with the superuser account (username *super*) that has Super Administrator privileges, which provides full access to Junos Space. When you first log in to Junos Space as the default Super Administrator, you can perform all tasks and access all Junos Space system resources. Super administrators can create new users and assign roles and domains to those users to specify which tasks users can perform.

Creating Users in Security Director

Use the Users page to create new users and assign one or more roles and domains to the users. You assign roles and domains to users based on the network management tasks that they perform. You need to have the privileges of a super administrator or user administrator to create users.

Before You Begin

- Read the [“Overview of Users in Security Director” on page 1058](#) topic.
- Review the Users main page to view the existing users. See [“Users Main Page Fields” on page 1070](#) for field descriptions.

Configuring Users

To configure a user:

1. Select **Administration > Users & Roles > Users**.
The Users page appears.
2. Click **Create**.
The Create User page appears.
3. Complete the configuration according to the guidelines provided in [Table 342 on page 1060](#).

NOTE: Fields marked with * are mandatory

4. Click **OK**.

A new user is created and you are returned to the Users page.

Table 342: User Settings

Setting	Description
<i>General</i>	
Username	Enter a unique string of alphanumeric characters and some special characters (- _ . @). No spaces are allowed and the maximum length is 128 characters.
Temporary Password	Select this option to generate a temporary password for the user. The user can log in with the temporary password and change the password using the My Profile page.
Temporary password will expire after	Specify the duration after which the temporary password expires. The user must log in within this duration and change the temporary password; after the expiry of the password, the user is not allowed to log in. The default is 24 hours and the range is 1 through 10,000 hours. NOTE: This field is visible only if the Temporary Password check box is selected.
Temporary Password	Displays the system-generated temporary password. Click the Generate button to generate another password NOTE: This field is visible only if the Temporary Password check box is selected.
E-mail password to user	Select this check box to send the generated temporary password to the e-mail address specified for the user. This check box is enabled only when the SMTP server is configured for Junos Space. If the e-mail does not reach the user or the password is lost, the administrator must generate a new temporary password. There is no option to resend the old temporary password. NOTE: This field is visible only if the Temporary Password check box is selected.
Password	Enter a password for the user. The password must be at least six characters long, contain at least one lowercase letter, contain at least one number that is not in the last position, must not contain the username or the username in reverse, and must not have three characters repeated in succession. The password strength indicator displays the efficiency of the password that you entered. NOTE: You cannot proceed to the next step if the password strength indicator shows that the password is weak.
Confirm Password	Reenter the password for confirmation.
First Name	Enter a string of alphanumeric characters and some special characters (- _ . @). The maximum length is 32 characters.

Table 342: User Settings (*continued*)

Setting	Description
Last Name	Enter a string of alphanumeric characters and some special characters (- _ . @). The maximum length is 32 characters.
E-Mail Address	Enter a valid e-mail address in the user@domain format.
Maximum Concurrent UI Sessions	Select the global setting or specify the maximum number of concurrent UI sessions allowed. The range is 0 through 999; 0 indicates unlimited concurrent UI sessions.
X.509 Certificate File	Upload an X.509 certificate file (.cer, .crt, or .pem extension), which is used to authenticate the user instead of the username and password. Click Next to continue.
<i>Role Assignment</i>	
Use Same Roles Assigned to	Specify the username of an existing user whose roles you want to assign to the new user. The roles for the user that you selected are displayed in the Selected column of the Role field.
Role	Select one or more roles in the Available column and click the forward arrow to confirm your selection. The selected roles are displayed in the Selected column. NOTE: You must select at least one role.
Job Management View	Select whether the user can view only the jobs triggered by that user (the default) or all jobs. Click Back to return to the previous section or Next to continue.
<i>Domain Assignment</i>	
Use Same Domains Assigned to	Specify the username of an existing user whose domains you want to assign to the new user.

Table 342: User Settings (continued)

Setting	Description
Available Domains	<p>Select one or more domains to assign to the user. If you select a domain with subdomains, the subdomains are also included. You must select at least one domain.</p> <p>If you do not assign a domain to the user, the Global domain is assigned to the user by default.</p> <p>Click Back to return to the previous section or Finish to go to a summary page.</p>

Editing and Deleting Users in Security Director

You can edit and delete users from the Users page. If the tasks performed by a user, or the user is no longer needed, then the administrator can delete the user.

Editing Users

To edit a user:

1. Select **Administration > Users & Roles > Users**.
The Users page appears.
2. Select the user that you want to edit, and click the pencil icon. Alternatively, right-click a user and select **Edit User**.
The Edit User page appears, showing the same fields that are presented when you create a user.
3. Edit the user fields as needed.

NOTE: Some fields cannot be edited.

4. The Edit User page appears, showing the same fields that are presented when you create a user.
5. Click **OK** to save the changes.

The changes are saved and you are returned to the Users page.

Deleting Users

To delete a user:

1. Select **Administration > Users & Roles > Users**.

The Users page appears.

2. Select the user that you want to delete, and click the X icon.

The Delete Users page appears, displaying the list of users selected for deletion.

3. (Optional) Delete users who have jobs that are in progress or scheduled to run later, by clearing the **Exclude users who have scheduled or in-progress jobs** check box..

4. Click **OK** to delete the selected users.

The users are deleted and you are returned to the Users page.

Viewing and Terminating Active User Sessions in Security Director

As a Junos Space user administrator, you can view and terminate user sessions before starting a maintenance cycle. You can view the list of users who are logged in along with details of their IP addresses, including where they logged in and the duration of their sessions. You can view and terminate user sessions from the Users page.

Viewing Active User Sessions

To view active user sessions:

1. Select **Administration > Users & Roles > Users**.

The Users page appears.

2. Click the **Active Sessions** button.

The Active Sessions page appears, displaying the list of active user sessions. [Table 343 on page 1064](#) describes the fields on this page.

3. Click **Close** to close the page.

You are returned to the Users page.

Table 343: Active Sessions Fields

Field	Description
Username	Username of the user.
Current Domain	Current domain to which the user belongs.
IP Address	IP address of the client from which the user has logged in.
Fabric Node Name	Name of the node in the Junos Space fabric that is currently serving the user session.
Session Start Time	Date and time at which the user session was initiated.
Session Duration	Duration of the user session.

Terminating Active User Sessions

To terminate one or more active user sessions:

NOTE: You cannot terminate sessions of a user with the username super

1. Select **Administration > Users & Roles > Users**.

The Users page appears.

2. Click the **Active Sessions** button.

The Active Sessions page appears, displaying the list of active user sessions.

3. Select the sessions that you want to terminate, and click **End Session**.

The End User Sessions page appears displaying the sessions selected for termination.

4. Specify whether you want to terminate the sessions immediately or later. If you specify that you want to terminate the sessions later, you must enter a date and time (in MM/DD/YYYY and HH:MM:SS AM/PM/24-hour formats).

5. Click **OK**.

The Job Detail: Terminate User Session page appears displaying the details of the session termination job.

6. Click **OK** to close the Job Detail page.

You are returned to the Users page.

Viewing the User Details in Security Director

You can view the details of users, which allows you to view information about a user at a quick glance on one page, from the Users page.

To view the details of a user:

1. Select **Administration > Users & Roles> Users**.

The Users page appears.

2. Double-click the user for which you want to view the details. Alternatively, select a user and, from the More menu, click View User Details.

The User Details page appears. [Table 344 on page 1066](#) describes the fields on this page.

3. Click **Close**.

You are returned to the Users page.

Table 344: Users Details Page Fields

Field	Description
Username	Username of the user.
Name	Name of the user.
E-mail	E-mail address of the user.
User Type	Indicates whether the user was created manually (local) or added automatically by Junos Space through remote login (remote).
Status	Indicates whether the user is enabled or disabled. Users are enabled by default. A user whose account is disabled cannot log in to Junos Space.
Use Global Settings	Indicates whether the global settings must be used to determine the maximum number of concurrent UI sessions permitted for the user.
Maximum concurrent UI sessions	Maximum number of concurrent UI sessions permitted for the user. If this field is set, then this value overrides the global settings.
Locked Out	Indicates whether a user is locked out or not. Users who are locked out cannot log in to Junos Space and must request an administrator to unlock their user accounts.
Password Status	Indicates whether the user's password is active, expired, or temporary.

Table 344: Users Details Page Fields (*continued*)

Field	Description
View Jobs	Indicates whether the user can view only the jobs triggered by that user or all jobs.
Assigned Roles	Roles to which the user is assigned. For the selected role, the Role Summary field on the right side of the page displays the tasks associated with that role.
Assigned Domains	Domains to which the user is assigned. Users can access only those objects within the domain to which they are assigned.

Clearing Local Passwords for Users in Security Director

The Clear Local Passwords feature lets you remove the local password that you assign to users when remote or remote-local authentication is enabled.

NOTE: This feature is enabled in Security Director only if you have configured remote authentication or remote-local authentication in Junos Space Network Management Platform.

A local password is an emergency password that allows remote users to log in to Junos Space using local authentication (username and password) in the following cases:

- If the authentication server goes down (in remote mode)
- If remote authentication fails (in remote-local mode)

To remove local users passwords, you must have the permission to perform the *Clear Local Passwords* action. However, if you are logged in to Security Director, you cannot perform this action for the user account that you used for logging in.

To clear local passwords for one or more users:

1. Select **Administration > Users & Roles > Users**.

The Users page appears.

2. Select the users for whom you want to clear the local passwords. From the More or right-click menu, select **Clear Local Passwords**.

The Clear Local Passwords page appears, displaying the list of users for whom you want to remove the local passwords.

3. Click **Clear Local Passwords** to confirm that you want to clear the local passwords for the selected users.

The local passwords for the selected users are cleared and you are returned to the Users page.

Disabling and Enabling Users in Security Director

You can disable and enable disabled users from the Users page. The Status column on the Users page displays the status of the users.

Administrators can disable users to prevent them from logging into Security Director and performing any actions. By default, all users are enabled.

NOTE: You cannot disable your own user account or the super user account (username *super*).

When a user is disabled and tries to log in, a message indicating that the account is disabled is displayed. If the user is logged in at the time when the user is disabled, the system logs off the user and displays a message indicating that the user account is disabled.

Disabling Users

To disable one or more users:

1. Select **Administration > Users & Roles > Users**.

The Users page appears.

2. Select the users that you want to disable. From either the More or right-click menu, select **Disable Users**.

The Disable Users page appears, displaying the list of users selected for disabling.

3. Click **Yes** to confirm the disable operation.

The users are disabled and you are returned to the Users page.

Enabling Users

To enable one or more users:

1. Select **Administration > Users & Roles > Users**.

The Users page appears.

2. Select the disabled users that you want to enable. From either the More or right-click menu, select **Enable Users**.

The Enable Users page appears, displaying the list of users selected for enabling.

3. Click **Yes** to confirm the enable operation.

The users are enabled and you are returned to the Users page.

Unlocking Users in Security Director

Junos Space Security Director locks out users who enter more than the permitted number of incorrect passwords. If your user account is locked out, then an error message is displayed when you try to log in to Security Director. You can try logging in from another client or request the administrator to unlock your account.

By default, a user is locked out after four unsuccessful login attempts. Administrators can configure the number of unsuccessful login attempts after which a user should be logged out in the Administration workspace of Junos Space Network Management Platform.

To unlock one or more users:

1. Select **Administration > Users & Roles > Users**.

The Users page appears.

2. Select the locked users that you want to unlock. From the More or right-click menu, select **Unlock Users**.

The Unlock Users page appears, displaying the list of users selected for unlocking.

3. Click **Yes** to confirm that you want to unlock the users.

The users are unlocked and you are returned to the Users page.

Domain RBAC Overview

A domain is a sphere or a boundary around which you can interact with a system. A Junos Space Network Management Platform domain encompasses all Junos Space objects; it enforces access, controls visibility, and provides for management of network objects. By creating a domain, you create a container for interacting with the system. Devices are the key elements in a domain. You use domains and the devices within those domains to configure a device-management partitioning scheme allowing for role-based access control (RBAC).

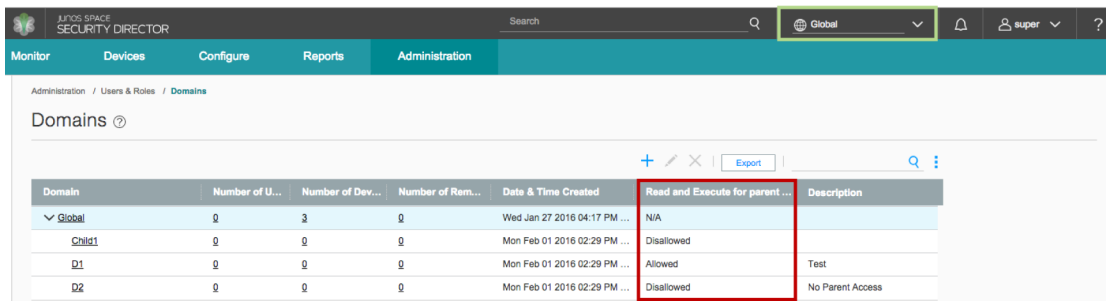

Domains allow you to control and partition a network from the management point of view. You can create a network based on certain criteria while providing users with management access to their devices. At the same time, domains allow sharing of objects and certain configuration enforcements. Objects in the Global domain can only be accessed in read-only mode by the child domains, if view parent is enabled. Access across peer domains is not allowed. This kind of network partitioning is required for both managed security service providers (MSSP) and enterprise customers. The Network Management Platform enables users to manage objects from all the allowed domains in the aggregated view. However, Security Director does not support this functionality. Starting in Security Director 15.2, RBAC is available on the Administration tab, under the Users & Roles section on the left navigation pane.

The following sections explain the impact of domain RBAC on Security Director objects and services.

About Domains

By default, Junos Space and, therefore, Security Director comes with only the Global domain defined. New domains can be created as child domains of the Global domain. When you create a domain, you work with roles and users. [Figure 154 on page 1073](#) shows a simple domain scheme that will be used as a reference throughout this document. For more information about creating domains, see [“Creating Domains in Security Director” on page 1087](#).

Figure 154: Security Director Domains

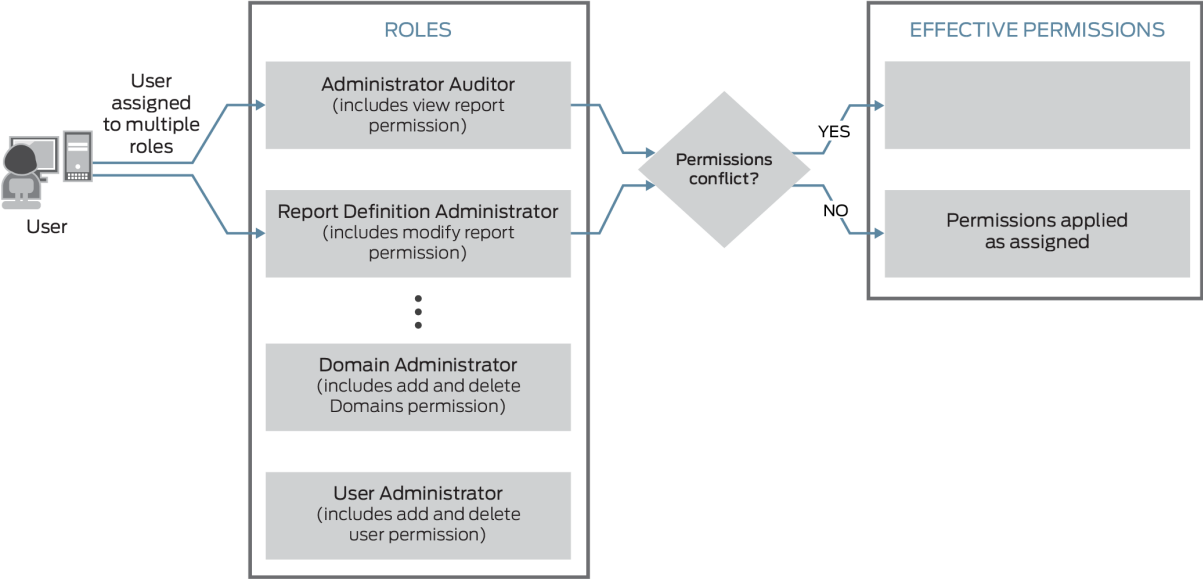

Domain	Number of U...	Number of Dev...	Number of Rem...	Date & Time Created	Read and Execute for parent ...	Description
Global	0	0	0	Wed Jan 27 2016 04:17 PM ...	N/A	
Child1	0	0	0	Mon Feb 01 2016 02:29 PM ...	Disallowed	
D1	0	0	0	Mon Feb 01 2016 02:29 PM ...	Allowed	Test
D2	0	0	0	Mon Feb 01 2016 02:29 PM ...	Disallowed	No Parent Access

Working with Roles

Roles are used to group access permissions for easier assignment to users. For example, the Super Administrator role assigns read and write access to all aspects of Junos Space, Security Director, and the functions within. On the other hand, the Domain Administrator has read and write access to some functions, read-only access to other functions, and no access to some other functions. Security Director comes with several predefined roles that cannot be changed, including the Super Administrator and the Domain Administrator. User-defined roles can be created by cloning and then editing the predefined roles or by creating new roles from scratch. Users are assigned to roles during the creation of their accounts or by editing the user accounts after creation.

Users can be assigned to multiple roles. If a user is assigned to multiple roles that have conflicting permissions, the least restrictive permissions are applied to that user account. For example, suppose the Administrative Auditor role restricts users to only viewing report definitions and the Report Definition Administrator role allows users to modify report definitions. If a user is assigned to both roles, that user will be able to modify report definitions. [Figure 155 on page 1074](#) illustrates this principle.

Figure 155: Security Director Roles

Working with Users

User accounts can be thought of as the recipients of RBAC policies. In Security Director, users are assigned to specific domains and to specific roles. Access to domains defines which devices and objects users can work with and assignment of users to roles defines what functions users can perform on the objects to which they have access. For more information about working with users, see [“Creating Users in Security Director” on page 1059](#).

[Figure 156 on page 1074](#) shows the Global domain view of the Junos Space users list. Note the Assigned Domain column outlined in green.

Figure 156: Security Director Users

The screenshot shows the Junos Space Security Director interface. The top navigation bar includes 'Monitor', 'Devices', 'Configure', 'Reports', and 'Administration'. The 'Administration' tab is selected, and the 'Users' page is displayed. The page title is 'Users'. Below the title, there is a table with columns: Username, First Name, Last Name, Email, Assigned Domain, User Type, Status, Password Status, and Locked Out. The 'Assigned Domain' column is highlighted with a green border. The table contains three rows of user data.

	Username	First Name	Last Name	Email	Assigned Domain	User Type	Status	Password Status	Locked Out
<input type="checkbox"/>	auditor	Administrative	Auditor	auditor@example.com	Global	Local	Enabled	Active	No
<input checked="" type="checkbox"/>	noc_operator	NOC	Operator	nocop@example.com	Global/D1	Local	Enabled	Active	No
<input type="checkbox"/>	super	Open	Space	super@juniper.net	Global	Local	Enabled	Active	No

About Objects or Services

Prior to domain RBAC, you only needed write permission for a domain to create an object or service in it. Now with domain RBAC, you also need access to a domain to create an object or service in that domain. For example, suppose you have domains D1, D2, and Global. To create an object in D1, you must switch to the D1 domain before you can create an object in that domain.

NOTE: You cannot create an object or service in one domain while you are in a different domain.

In Security Director Release 13.2 and later, the REST API cannot be used to create objects in child domains, even if the user account used with the API has write access to the child domain. All objects created through the REST API are created in the Global domain.

All the objects that are created internally as part of an operation are part of the domain in which the operation is triggered. For example, all audit logs for an operation are created in the domain in which the operation is triggered.

Reading or Viewing Objects or Services

You can view all objects in a domain to which you have access. In Security Director, you must switch the view to the D1 domain to view objects in that domain. If you have read access to both the D1 and D2 domains, you cannot see D2 domain objects from the D1 domain view, and vice versa. You can see objects in the Global domain from the D1 domain, provided the D1 domain has view parent permission. You cannot see D1 or D2 objects from the Global domain.

The ability to read or write objects in any given domain is dependent on switching your view to that specific domain from the Domains menu. However, Security Director also allows you to view objects in the parent domain as read-only if the view parent setting is enabled. For example, given the domain structure shown in [Figure 154 on page 1073](#), the resulting views of the shared address objects in domains D1 and D2 are shown in [Figure 157 on page 1076](#) and [Figure 158 on page 1076](#) and respectively.

Figure 157: D1 Domain Addresses

The screenshot shows the Junos Space Security Director interface with the 'Configure' tab selected. The breadcrumb trail is 'Configure / Shared Objects / Addresses'. The 'Addresses' section is active, displaying a table of address objects for the D1 domain. The table has columns for Name, Type, Host Name, IP Address, Description, and Domain. The following table represents the data shown in the screenshot:

	↑ Name	Type	Host Name	IP Address	Description	Domain
<input type="checkbox"/>	1.1.1.1/32	Host		1.1.1.1		Global
<input type="checkbox"/>	3.3.3.3/32	Host		3.3.3.3		Global
<input type="checkbox"/>	Any	Any Address			Predefined any address	SYSTEM
<input type="checkbox"/>	Any-IPv4	Any IPv4 Address			Predefined any-ipv4 address	SYSTEM
<input type="checkbox"/>	Any-IPv6	Any IPv6 Address			Predefined any-ipv6 address	SYSTEM
<input type="checkbox"/>	D1_DNS_Server	Host	dns1.domain1.example.com	192.0.20.53	DNS Server for Domain D1	Global/D1
<input type="checkbox"/>	mailserver	Host		10.1.1.200		Global
<input type="checkbox"/>	webserver	Host		10.1.1.100		Global

In the D1 Domain view, address objects from the System, Global, and D1 Domains are visible. These address objects can be used with devices and policies in the D1 Domain.

Figure 158: D2 Domain Addresses

The screenshot shows the Junos Space Security Director interface with the 'Configure' tab selected. The breadcrumb trail is 'Configure / Shared Objects / Addresses'. The 'Addresses' section is active, displaying a table of address objects for the D2 domain. The table has columns for Name, Type, Host Name, IP Address, Description, and Domain. The following table represents the data shown in the screenshot:

	↑ Name	Type	Host Name	IP Address	Description	Domain
<input type="checkbox"/>	Any	Any Address			Predefined any address	SYSTEM
<input type="checkbox"/>	Any-IPv4	Any IPv4 Address			Predefined any-ipv4 address	SYSTEM
<input type="checkbox"/>	Any-IPv6	Any IPv6 Address			Predefined any-ipv6 address	SYSTEM

Because the view parent setting is disabled in D2, the only visible addresses in the D2 domain are the ones that exist in the System Domain. Any address created later in the D2 Domain would also show in this view.

Updating or Modifying Objects or Services

To modify a domain object through Security Director, you must switch to that domain. You cannot switch to a domain for which you do not have access. You cannot modify an object in one domain if you are in a different domain.

Modifying objects through REST is ID based. To modify an object in a domain, you must have write access to that domain and your user role must include modify permissions for the object type in question. Objects in the System domain are in read-only mode so you cannot modify them.

Deleting Objects or Services

To delete a domain object through Security Director, you must switch to that domain. You cannot delete an object in one domain if you are in a different domain.

Deleting objects through REST is ID based. To delete an object in a domain, you must have write access to that domain and your user role must include delete permissions for the object type in question. Objects in the System domain are in read-only mode so you cannot delete them.

Referencing Objects

An object can always reference another object in the same domain, with no restrictions. An object in the D1 domain can reference other objects in the D1 domain. The rules are more complex for referencing objects in a different domain. For example, a D1 domain object can reference objects in the D1 domain or in its parent domain, the Global domain. However, D1 objects cannot reference D2 objects. Objects in the Global domain cannot reference objects in child domains, D1 and D2. See [Figure 159 on page 1077](#).

Figure 159: Security Director Domain References

There is an exception to this rule when it comes to referencing devices. Objects in the D1 domain can reference devices in the same domain or they can reference devices in the D2 domain. But this is not true in reverse; that is, objects in the D1 domain cannot reference devices in the Global domain.

NOTE: Services cannot reference other services even within the same domain.

Moving Objects Across Domains

You can move objects from one domain to another, in general. For example, you can move an object from the D1 domain to the Global domain and from the Global domain back to the D1 domain. A validation is performed to check that the move was valid. Invalid moves are not allowed. Moving an object becomes complex if the object is referenced by another object. An object in the D1 domain can be moved up to the Global domain if it is referenced by another object that is either in the D1 domain or in the Global domain. However, moving an object from the Global domain to the D1 domain is not allowed if the object is referenced by another object in the Global domain.

The rules are different for moving device objects between domains. You can move a device from the Global domain to the D1 domain if the device is used by an object in either the Global or the D1 domain. However, moving a device from the D1 domain to the Global domain is not allowed if an object in the D1 domain is using that device.

To move a device that is part of a cluster, you must move both members of the cluster. You cannot move only the primary or only the secondary device. You can move an object from the D1 domain to the Global domain only if you have write access to the Global domain and view parent access enabled in the D1 domain.

Naming Objects in a Domain

The name of an object must be unique within a domain hierarchy. Objects with the same name cannot be created in both the D1 and Global domains. The domain hierarchy includes the current domain, its parent, and its child domains.

All the name validations consider domains as one of the constraints.

The object name must be a string beginning with a number or letter and consisting of alphanumeric characters, colons, periods, slashes, dashes, and underscores. The object name must not contain special characters such as &, <, >, and \n.

About Predefined Objects

All Security Director predefined objects are in the System domain. The predefined services, addresses, signatures, and so on are visible from all the domains in read-only mode.

All device-specific predefined objects are also in the System domain. When a new predefined object is discovered during the device discovery process, that object is also placed in the System domain. The All Device policy is placed in the Global domain and you can modify that policy.

Creating Customized Roles in Security Director

Use the Roles page to create customized (user-defined) roles.

After you create roles, you can assign the roles to various user accounts that you created in Junos Space or to remote profiles for remote authorization. Roles allow you to segregate users based on the functionality that they are allowed to access.

When a user logs in to Junos Space, the workspaces that the user can access and the tasks that they can perform are determined by the roles that have been assigned to that particular user account.

Before You Begin

- Read the [“Understanding Roles in Security Director” on page 1080](#) topic.
- Review the Roles main page to view the existing users. See [“Roles Main Page Fields” on page 1085](#) for field descriptions.

Configuring Roles

To configure a role:

1. Select **Administration > Users & Roles > Roles**.

The Roles page appears.

2. Click **Create**.

The Create Role page appears.

3. Complete the configuration according to the guidelines provided in [Table 346 on page 1080](#).

4. Click **OK**.

A new role is created and you are returned to the Roles page.

Table 346: Role Settings

Setting	Description
Title	Enter a unique title for the role that is a string containing alphanumeric characters, spaces, and some special characters (- . _). The title must not start with a space and the maximum length is 32 characters.
Description	Enter a description unique string containing alphanumeric characters, spaces, and some special characters (- . _). The maximum length is 256 characters.
Privileges	Select one or more tasks to assign to the custom (user-defined) Role. You must associate at least one task with a role.

Understanding Roles in Security Director

Roles define the functionality or tasks that a user can perform in Junos Space, and they enable you to segregate users based on the functionality that they are allowed to access. You do this by assigning a different set of roles to various user accounts (in the case of local user accounts created in Junos Space) or to remote profiles to be used for remote authorization. When a user logs in to Junos Space, the tasks that they can perform are determined by the roles that have been assigned to that particular user account.

There are two types of roles: predefined roles, which are created by Junos Space, and user-defined (customized) roles, which must be created manually. The list of predefined user roles that Junos Space Security Director supports is available on the Roles page (select **Administration > Users & Roles > Roles**).

Roles can only be created by users who are assigned the User Administrator or Super Administrator or by a user with the Create Role permission.

Editing, Cloning, and Deleting Roles in Security Director

You can edit, clone, and delete roles from the Roles page.

Editing Roles

To edit a role:

NOTE: Predefined roles cannot be edited.

1. Select **Administration > Users & Roles > Roles**.

The Roles page appears.

2. Select the role that you want to edit, and click the pencil icon or select **Edit Role** from the right-click menu.

The Edit Role page appears, showing the same fields that are presented when you create a role.

3. Edit the role fields as needed.

NOTE: The role title cannot be edited.

4. Click **OK** to save the changes.

The changes are saved and you are returned to the Roles page.

Cloning Roles

To clone a role:

1. Select **Administration > Users & Roles > Roles**.

The Roles page appears.

2. Select the role that you want to clone. From the More or the right-click menu, select **Clone Role**.

The Clone Role page appears, showing the same fields that are presented when you create a role.

3. Modify the role fields as needed.

4. Click **OK** to save the changes.

The cloned role is created and you are returned to the Roles page.

Deleting Roles

To delete one or more roles:

NOTE: Predefined roles cannot be deleted.

1. Select **Administration > Users & Roles > Roles**.

The Roles page appears.

2. Select the roles that you want to delete and click the X icon. Alternatively, select the roles and from the More menu, select **Delete Roles**.

The Confirm Delete page appears.

3. Click **Yes** to delete the selected roles.

The changes are saved and you are returned to the Roles page.

Importing and Exporting Roles in Security Director

You can import and export roles from the Roles page. You import roles from an XML file to add new roles to Junos Space Security Director. If you are importing roles for the first time, we recommend that you view the sample XML file first. You export user-defined (customized) roles from the Junos Space database to access details about the roles and download the file to your local computer.

Importing Roles

To import one or more roles:

1. Select **Administration > Users & Roles > Roles**.

The Roles page appears.

2. Click **Import**.

The Import Roles page appears.

3. Use the Browse button to select the file that you want to import.

NOTE: Click the View Sample XML File link to view or download the sample XML file.

4. Click Import Roles to import the selected roles.

The Job Details page appears displaying details of the job.

5. Click **OK** to close the Job Details page.

You are returned to the Roles page.

Exporting Roles

To export one or more roles:

NOTE: Predefined roles cannot be exported.

1. Select **Administration > Users & Roles > Roles**.

The Roles page appears.

2. Select the roles that you want to export. From the More or right-click menu, select **Export Roles**.

The Export Roles page appears.

3. Click **Yes** to confirm the export operation.

The Job Details: Export Roles page appears displaying the details of the job. Use the link in the Download field to download the exported roles.

- 4. Click **OK** to close the Job Details page.

You are returned to the Roles page.

Overview of Domains in Security Director

A domain is a logical mapping of objects, such as devices, to users who access and manage the network by using these objects. Junos Space allows a hierarchical structure for domains. The top-level domain is called the Global domain. You can create a hierarchy of up to five levels of subdomains under the Global domain. You can use these subdomains to create easily manageable sections of your network. When you assign objects and users to these subdomains, users can manage these objects partially or completely based on the roles assigned to them.

You can assign or unassign users and remote profiles to domains, and assign devices to domains.

Switching Between Domains

If you have access to more than one domain, you can switch between domains without having to log out and in to Security Director. To switch between domains, click the Domain Switcher in the Security Director banner, which is displayed at the top of every Security Director page, and then select the domain to which you want to switch.

Viewing Users, Devices, and Remote Profiles Assigned to a Domain in Security Director

You can view the users, devices, and remote profiles assigned to a domain from the Domains page. This enables you to view the users, devices, and remote profiles assigned to a particular domain at a quick glance on one page.

To view the details of a domain:

1. Select **Administration > Users & Roles > Domains**.

The Domains page appears.

2. Click the domain name link to view the users, devices, and remote profiles assigned to the domain.

The *Domain-Name* page appears with the Assigned Users tab selected by default. [Table 350 on page 1091](#) describes the fields on this page.

3. Click the **Assigned Devices** tab to view the devices assigned to the domain.

The *Domain-Name* page appears with the Assigned Devices tab selected. [Table 351 on page 1092](#) describes the fields on this page.

4. Click the **Assigned Remote Profiles** tab to view the devices assigned to the domain.

The *Domain-Name* page appears with the with the Assigned Remote Profiles tab. [Table 352 on page 1092](#) describes the fields on this page.

5. Click **Domains** in the left-hand menu to return to the Domains page.

You are returned to the Domains page

Table 350: Assigned Users Tab Fields

Field	Description
Username	Username of the user assigned to the domain.
First Name	First name of the user assigned to the domain.
Last Name	Last name of the user assigned to the domain.
E-Mail Address	E-mail address of the user assigned to the domain.
Status	Indicates whether the user is enabled or disabled.

Table 350: Assigned Users Tab Fields (*continued*)

Field	Description
Assigned Domains	Domains to which the user is assigned.

Table 351: Assigned Devices Tab Fields

Field	Description
Device Name	Name of the device assigned to the domain.
IP Address	IP address of the device assigned to the domain
Platform	Name of the device assigned to the domain.

Table 352: Assigned Remote Profiles Tab Fields

Field	Description
Profile Name	Name of the remote profile assigned to the domain.
Description	Description of the remote profile assigned to the domain.

Assigning Devices to Domains in Security Director

You can assign devices to domains using the Domains page. You assign devices to domains if you want to logically group devices in domains. If you switch from one domain to another, then only the devices belonging to that domain are accessible.

To assign devices to a domain:

1. Select **Administration > Users & Roles > Domains**.

The Domains page appears.

2. From the Number of Devices column, click the numbered link corresponding to the domain to which you want to assign devices.

You are taken to the *Domain-Name* page with the Assigned Devices tab selected.

3. Click the **+** icon.

The Assign Devices to Domain *Domain-Name* page appears displaying a list of devices that can be assigned. You can click the **View Audit Log** link to view the details of the audit log entry for the domain assignment. You are taken to the Audit Logs page in Junos Space Network Management Platform.

4. Select one or more devices by clicking the check boxes corresponding to the remote profiles.

5. Click **OK**.

The Assign Objects to Domain Status page appears displaying the status of the domain assignment. Click the **View Audit Log** link to view the audit log entry in the Audit Logs page.

6. Click **OK**.

You are taken to the *Domain-Name* page.

Assigning and Unassigning Remote Profiles to Domains in Security Director

IN THIS SECTION

- [Assigning Remote Profiles to Domains | 1094](#)
- [Unassigning Remote Profiles from Domains | 1095](#)

You can assign remote profiles to domains or unassign remote profiles from domains using the Domains page. You assign a remote profile to a domain if you want to restrict the objects only to that domain to which users associated with the remote profile have access. You unassign a remote profile from a domain if you no longer want to provide users associated with the remote profile access to that domain.

Assigning Remote Profiles to Domains

To assign remote profiles to a domain:

1. Select **Administration > Users & Roles > Domains**.

The Domains page appears.

2. From the Number of Remote Profiles column, click the numbered link corresponding to the domain to which you want to assign remote profiles.

You are taken to the *Domain-Name* page with the Assigned Remote Profiles tab selected.

3. Click the **+** icon.

The Assign Remote Profiles to Domain *Domain-Name* page appears displaying a list of remote profiles that can be assigned.

4. Select one or more remote profiles by clicking the check boxes corresponding to the remote profiles.

5. Click **OK**.

The remote profiles are assigned to the domain and you are returned to the Domain-Name page.

Unassigning Remote Profiles from Domains

To unassign remote profiles from a domain:

1. Select **Administration > Users & Roles > Domains**.

The Domains page appears.

2. From the Number of Remote Profiles column, click the numbered link corresponding to the domain from which you want to unassign remote profiles.

You are taken to the *Domain-Name* page with the Assigned Remote Profiles tab selected.

3. Select the remote profiles that you want to unassign.

4. Click the X icon.

The selected remote profiles are unassigned from the domain and you are returned to the *Domain-Name* page.

Assigning and Unassigning Users to Domains in Security Director

IN THIS SECTION

● [Assigning Users to Domains | 1096](#)

● [Unassigning Users from Domains | 1096](#)

You can assign users to domains or unassign users from domains using the Domains page. You assign users to a domain if you want to restrict the objects to which the users have access only to that domain. You unassign users from a domain if you no longer want to provide users access to that domain.

Assigning Users to Domains

To assign users to a domain:

1. Select **Administration > Users & Roles > Domains**.

The Domains page appears.

2. From the Number of Users column, click the numbered link corresponding to the domain to which you want to assign users.

You are taken to the *Domain-Name* page with the Assigned Users tab selected.

3. Click the Assign User icon.

The Assign Users to Domain *Domain-Name* page appears displaying a list of users that can be assigned.

4. Select one or more users by clicking the check boxes corresponding to the users.

5. Click **OK**.

The users are assigned to the domain and you are returned to the *Domain-Name* page.

Unassigning Users from Domains

To unassign users from a domain:

1. Select **Administration > Users & Roles > Domains**.

The Domains page appears.

2. From the Number of Users column, click the numbered link corresponding to the domain from which you want to unassign users.

You are taken to the *Domain-Name* page with the Assigned Users tab selected.

3. Select the users that you want to unassign.

4. Click the Unassign User icon.

The users are unassigned from the domain and you are returned to the *Domain-Name* page

Overview of Remote Profiles in Security Director

Remote profiles are used to assign a specific set of roles to users when remote authentication and authorization are enabled in Junos Space. A remote profile is a collection of roles defining the set of functions that a user is allowed to perform.

Junos Space does not create remote profiles by default, and if you want to use remote authentication and authorization, you must create one or more remote profiles. When you create a remote profile, you must specify one or more roles and domains to associate with the remote profile. You can then configure the name of the remote profile for one or more user accounts in the remote authentication servers (RADIUS or TACACS+) that you are using for authentication and authorization. Remote profile names can be configured as a vendor-specific attribute (VSA) in RADIUS servers and as an attribute-value pair (AVP) in TACACS+ servers.

When a remote authentication server successfully authenticates a user session, the server includes the configured remote profile name for that user in the response message that is sent to Junos Space. Junos Space looks up the remote profile based on this name and determines the set of roles for the user. Junos Space then uses this information to control the set of workspaces the user can access and the tasks the user is allowed to perform.

Logging Management

IN THIS CHAPTER

- [Logging and Reporting Overview | 1105](#)

Logging and Reporting Overview

The Junos Space Security Director Logging and Reporting module enables log collection across multiple SRX Series devices and enables log visualization.

You can use either Security Director Log Collector or Juniper Secure Analytics (JSA) as a log collector. For details on deploying and configuring JSA, see [Juniper Secure Analytics](#) documentation.

The Logging and Reporting module provides:

- Device health and events monitoring.
- Visualization of security events resulting from complex and dynamic firewall policies using dashboard and event viewer.
- Device health monitoring of CPU and memory.
- Alert notification about specific events or upon attaining threshold limits.
- Scalable virtual machine (VM) based log collection and log collector management.

NOTE: For details on installing Security Director and setting up Log Collector, see *Security Director Installation and Upgrade Guide*.

Logs, also called event logs, provide vital information for managing network security, incident investigation, and response. Logging provides the following features:

- Receives events from SRX Series devices and application logs.
- Stores events for a defined period of time or a set volume of data.

- Parses and indexes logs to help speed up searching.
- Provides queries and helps in data analysis and historical events investigation.

You must configure Security Director and SRX series devices to receive logs. Select **Security Director > Devices > Device Management** to configure syslog to receive SRX Series device logs.

Logging Management-Logging Nodes

IN THIS CHAPTER

- [Adding Logging Nodes | 1107](#)
- [Enabling Log Forwarding | 1109](#)
- [Logging Nodes Main Page Fields | 1110](#)

Adding Logging Nodes

Use this page to configure logging nodes. You must deploy either Security Director Log Collector or Juniper Secure Analytics (JSA) as a log collector and then add it to Security Director to view the log data in the Dashboard, Events and Logs, Reports, and Alerts pages.

Before You Begin

- Read the [“Logging and Reporting Overview” on page 1105](#) topic.
- Configure system log and security logging configuration from **Devices > Security Devices > Modify Configuration**. See [“Modifying the Configuration of Security Devices” on page 208](#).
- Review the Logging Management main page for an understanding of your current data set. See [“Logging Nodes Main Page Fields” on page 1110](#) for field descriptions.
- For information on JSA, see [Juniper Secure Analytics](#) documentation.

Adding Logging Nodes

To add Log Collector to Security Director:

1. Select **Administration > Logging Management > Logging Nodes**.
2. Click the + icon to add logging nodes. The Add Logging Node page appears.
3. Choose the Log Collector type as **Security Director Log Collector** or **Juniper Secure Analytics**.

NOTE: Starting in Junos Space Security Director Release 16.2, the Log Collector type Juniper Secure Analytics is added.

4. Click **Next**.
5. Complete the configuration for Add Collector/JSA Node according to the guidelines provided in [Table 357 on page 1108](#).
6. Click **Next**.
The certificate details are displayed.
7. Click **Finish**.
8. Review the summary of configuration changes from the summary page and click **Edit** to modify the details, if required.
9. Click **OK** to add the node.

A new logging node with your configurations is added. To verify if the node is configured correctly, click **Logging Management > Logging Nodes** to check the status of the node.

NOTE: In Junos Space Security Director Release 16.2, the JSA node is added only via Security Director, so the JSA node is not displayed in **Space > Administration > Fabric**.

Table 357: Logging Node Settings

Settings	Guidelines
Node Name	Enter a unique name for the node that is a string of alphanumeric characters, colons, periods, dashes, and underscores. No spaces are allowed and the maximum length is 29 characters.
IP Address	Enter an IPv4 or IPv6 address for the node.
User Name and Password	For Security Director Log Collector, provide the default credentials admin/juniper123. Change the default password. For JSA, provide the admin credentials that is used to login to the JSA console.

Release History Table

Release	Description
16.2	Starting in Junos Space Security Director Release 16.2, the Log Collector type Juniper Secure Analytics is added.
16.2	In Junos Space Security Director Release 16.2, the JSA node is added only via Security Director, so the JSA node is not displayed in Space > Administration > Fabric .

Enabling Log Forwarding

To enable log forwarding:

1. Select **Administration > Logging Management > Logging Nodes**.
2. On the upper right side of the page, click the Log Forwarding button.
3. Complete the configuration.

Table 358: Log Forwarding

Settings	Guidelines
Syslog Forwarding	Enable this option to forward the logs to a syslog server.
Destination IP	Specifies the IP address to which the syslog is forwarded.
Port Number	Specifies the port number to which the syslog is forwarded.
Protocol	Specifies the protocol to which the syslog is forwarded. The available protocols are TCP and UDP.

NOTE: Starting in Junos Space Security Director Release 16.2 onward, log forwarding is not supported on JSA.

Release History Table

Release	Description
16.2	Starting in Junos Space Security Director Release 16.2 onward, log forwarding is not supported on JSA.

Logging Nodes Main Page Fields

Use this page to manage and configure Log Collector. You can add, remove, log forward, or change the database password for the logging nodes. You can also view log information such as node name, type of node, node IP address, status, version, and the last boot time of the logging node.

Table 359 on page 1110 describes the fields on this page.

Table 359: Logging Management Main Page Fields

Field	Description
Node Name	Name of the log collector node.
Node Type	Type of node used for logging: Security Director Log Collector or Juniper Secure Analytics
Node IP	IP address of the node.
Status	Current network status of the node.

Table 359: Logging Management Main Page Fields (continued)

Field	Description
Version	Version of the node.
Last Boot Time	Last system reboot time.

NOTE: In Junos Space Security Director Release 16.2, the Status, Application, Version, and Last Boot Time are not displayed for the JSA node. The Log Forwarding and Change Log Password options are not available for JSA node.

Release History Table

Release	Description
16.2	In Junos Space Security Director Release 16.2, the Status, Application, Version, and Last Boot Time are not displayed for the JSA node. The Log Forwarding and Change Log Password options are not available for JSA node.

Logging Management-Statistics & Troubleshooting

IN THIS CHAPTER

- [Using the Log Statistics and Troubleshooting | 1112](#)

Using the Log Statistics and Troubleshooting

Use this page to view the statistical information for each node. The log statistics is displayed as a time series chart, which shows the average event rate per day. You can view the event pattern for up to 90 days.

You can also view the complete statistic details such as node name, node type, events per second rate, time when the last log was received, total disk space, free space, health status, CPU usage, memory usage, and disk I/O wait period. You can use this information to troubleshoot issues with your node.

Before You Begin

- Read the **Logging and Reporting Overview** topic.
- Review the Logging Management main page for an understanding of your current data set. See [“Logging Devices Main Page Fields” on page 1114](#) for field descriptions.

Using the Log Statistics and Troubleshooting Page

To use the Log Statistics and Troubleshooting Page:

1. Select **Administration > Logging Management > Statistics & Troubleshooting**.
The Node Statistics page appears.
2. Use the guidelines provided in [Table 360 on page 1112](#) to learn about the page.

Table 360: Node Statistics

Action	Guideline
Refresh	Refreshes the node statistics information.

 **NOTE:** In Junos Space Security Director 16.2, for JSA node, information is not displayed.

Release History Table

Release	Description
16.2	In Junos Space Security Director 16.2, for JSA node, information is not displayed.

Logging Devices Main Page Fields

Use the Logging Devices section to view the details about your log receiver nodes. These nodes receive logs from devices, you can view details such as name, IP address, and the average events per second received on each node.

To use the Logging Device page:

1. Select **Administration > Logging Management > Logging Devices**. The Logging Devices page appears.
2. Read the descriptions provided in [Table 361 on page 1114](#) to learn about the page.

Table 361: Logging Devices Main Page Fields

Field	Description
Node Name	Name of the Security Director Log Collector or Juniper Secure Analytics.
Node IP	IP address of the node.
Average EPS	Average events per second (eps) on an hourly basis.

Device Configuration

Use the Device Configuration section to view the configured log collector details for your device such as its IP address, average events per second rate, and the last updated timestamp. See [Table 362 on page 1115](#) to learn about the page.

Table 362: Device Configuration Main Page Fields

Field	Description
Device Name	Name of the device.
Device IP	IP address of the device.
Sending Logs To (Receiver Node)	IP address of the receiving node.
Average EPS (Hourly)	Average events per second (eps) on an hourly basis.
Last Updated	Last updated timestamp.

RELATED DOCUMENTATION

Creating Security Logs

To configure security logging:

1. Select **Security Director > Devices > Device Management**.

The Device Management page appears.

2. Right-click a device and select **Device Configuration > Modify Configuration**.

The View/Edit Configuration page appears.

3. Under the Security section, click **Security Logging**.

The Create Security Logging page appears.

4. Under the General Settings section, configure the following parameters:

- From the Mode list, select the mode of logging as stream or event.
- To specify a source IP address or the IP address used when exporting security logs, enter the IP address in the Source Address field.

- From the Format list, select the logging format as syslog, sd-syslog, or binary.
- To limit the rate per second at which data plane logs are generated, enter the rate value in the Rate-Cap field.
- To disable security logging for a device, select the **Disable Logging** check box.
- To use Coordinated Universal Time (UTC) for security log timestamps, select the **UTC-Timestamp** check box.
- To limit the rate per second at which logs are streamed, enter the event rate in the Event-rate field.

5. Under the Stream section, configure the following parameters:

To create a new stream configuration:

- Click the plus sign (+).

The Stream Configuration page appears.

- In the Stream Name field, enter the name of the new stream configuration.
- In the Host field, enter the IPv4 or IPv6 address.
- In the Port field, enter the port number.
- In the Severity list, select one of the following available required severity types:
 - Emergency
 - Alert
 - Critical
 - Error
 - Warning
 - Notice
 - Info
 - Debug
- In the Category list, select the type of category as all or content-security.
- In the Format list, select the type of format as syslog, sd-syslog, welf, or binary.
- To create a new stream, click **Ok**.

You can modify or delete the existing streams. To modify or edit a stream, select the stream and click the pencil icon. To delete a stream, select the stream and click the minus sign (-).

6. Expand the File section and configure the following parameters:

- In the File Name field, enter a filename for the log data file.
- In the File Path field, enter the path where the log file is saved.

- In the File Size field, enter the maximum size of the log file in megabytes.
- In the Max No. Of files field, enter the maximum number of log files to create for each session.

7. Expand the Cache section, and configure the following parameters:

- In the Limit field, enter the maximum number of log entries to store in the cache memory. The default value is 10,000 entries.

8. To restrict the device from logging certain configurations, you can create different exclude configurations.

To create a new exclude configuration:

- Under the Exclude section, click the plus sign (+).

The Exclude Configuration page appears.

- In the Name field, enter the name of a new exclude configuration.
- Under the Destination section, in the IP Address field, enter the destination IP address in IPv4 or IPv6 address format. The audit log does not include security alarms from the specified destination IP address.

In the Port field, enter the destination IP address port.

- Under the Source section, in the IP Address field, enter the source IP address in IPv4 or IPv6 address format. The audit log does not include security alarms from the specified source IP address.

In the Port field, enter the source IP address port.

- Under the Other Filters section, configure the following parameters:
 - In the Event Id field, enter the event ID of the security event. The audit log does not include security alarms for this event ID.
 - To restrict the logging of failed events, select the **Failure** check box.
 - In the Interface field, enter the name of the interface. The audit log does not include security alarms from the specified interface.
 - In the Policy Name field, enter the policy name.
 - In the Process field, specify the name of the process that is generating the events.
 - In the Protocol field, enter the protocol name.
 - To restrict the logging of successful events, select the **Success** check box.
 - In the User Name field, enter the name of the authenticated user. All security events that are enabled by this user are not generated in the audit log.
- To create a new exclude configuration, click **Ok**.

9. To create a new security log, click **Ok**.

NOTE: Security logging is not supported for the logical systems devices.

Monitor Settings

IN THIS CHAPTER

- About the Monitor Settings Page | 1119
- Monitor Settings Overview | 1120

About the Monitor Settings Page

To access this page, click **Administration > Monitor Settings**.

You can use the Monitor Settings page to enable and disable polling of data from devices. Polling allows Security Director to pull data specific to traffic, resource usage, and sessions across user-specified time intervals.

Tasks You Can Perform

You can perform the following task from this page:

- Configure monitor settings. To change the status of a device, select a device, click **Enable** or **Disable** and follow the guidelines in [Table 363 on page 1119](#).

Field Descriptions

[Table 363 on page 1119](#) provides guidelines on using the fields on the Monitor Settings page.

Table 363: Fields on the Monitor Settings Page

Field	Description
Device Monitoring	Enable or disable device monitoring. By default, device monitoring is enabled.
Traffic Polling	Enable or disable traffic polling. The allowed range is 1 to 60 minutes. By default, traffic polling is enabled every 15 minutes.

Table 363: Fields on the Monitor Settings Page (*continued*)

Field	Description
Resource Usage Polling	Enable or disable resource usage polling. The allowed range is 1 to 60 minutes. By default, resource usage polling is enabled every 10 minutes.
Session Polling	Enable or disable session polling. The allowed range is 1 to 60 minutes. By default, session polling is disabled. Session polling can be enabled every 30 minutes, by default.
Device Name	Name of a device. Example, device1.
IP Address	IP address of a device. Example, 10.0.0.0.
Platform	The SRX series device platform. Example, SRX1500.
Status	<p>The status of a device. The options are:</p> <ul style="list-style-type: none"> • Enable – Enables device polling. • Disable – Disables device polling.

RELATED DOCUMENTATION

[Monitor Settings Overview](#) | 1120

Monitor Settings Overview

Device monitoring allows Security Director to poll devices for health and system data. The collected data is shown in the widgets on the dashboard.

You can enable and disable polling of data from devices. Polling allows Security Director to pull data specific to traffic, resource usage, and sessions across user-specified time intervals.

To change the status of a device, select a device and click **Enable** or **Disable**.

You can enable or disable polling when you need information on the devices that are managed by Security Director. If polling is enabled, then data is displayed in the widgets in the dashboard. If polling is disabled, then data is not displayed in the widgets. The following device widgets in the dashboard are dependent on the configured monitor settings:

- Devices Most CPU Usage
- Devices Most Memory Usage
- Devices Most Sessions
- Devices Most Bandwidth by Bytes
- Zones Most Bandwidth by Bytes
- Devices Most Dropped Packets
- Zones Most Dropped Packets
- Devices Most Bandwidth by Packets
- Zones Most Bandwidth by Packets
- Devices Most Storage

Signature Database

IN THIS CHAPTER

- [Using the Signature Database | 1122](#)
- [Understanding Signature Databases | 1123](#)
- [Signature Database Main Page Fields | 1124](#)
- [Installing the Signature Database Configuration | 1125](#)
- [Downloading the Signature Database Configuration | 1127](#)
- [Uploading the Signature Database Configuration from a File System | 1128](#)

Using the Signature Database

Use the Signature Database page to download and install the intrusion prevention system (IPS) signature database and application firewall signature database to security devices. This database includes signature definitions of attacks and applications that can be used to identify applications for tracking firewall policies, quality of service prioritization, and IPS.

Before You Begin

- Read the [“Understanding Signature Databases” on page 1123](#) topic.
- Ensure that your device has a connection to the Internet to download security package updates.
- Review the signature database main page for an understanding of your current data set. See [“Signature Database Main Page Fields” on page 1124](#) for field descriptions.

Downloading and Installing the Signature Database Configuration

If signature database is not downloaded, navigate to **Administration > Signature Database** to download the latest signatures.

1. To download the signature database configuration, perform the steps provided in [“Downloading the Signature Database Configuration” on page 1127](#).

2. To upload the signature database configuration, perform the steps provided in [“Uploading the Signature Database Configuration from a File System” on page 1128](#).
3. To install the signature database configuration, perform the steps provided in [“Installing the Signature Database Configuration” on page 1125](#).

Once you download and install the signatures, you can use them to configure application services.

RELATED DOCUMENTATION

[Understanding Signature Databases | 1123](#)

[Signature Database Main Page Fields | 1124](#)

Understanding Signature Databases

The signature database is one of the major components of the intrusion prevention system (IPS). This database includes signature definitions of attacks and applications that can be used to identify applications for tracking firewall policies, quality of service prioritization, and IPS.

The IPS signature database is stored on an IPS enabled device and contains definitions of predefined attack objects and groups. These attack objects and groups are designed to detect known attack patterns and protocol anomalies within the network traffic. You can configure attack objects and groups as match conditions in IPS policy rules.

The following download options are available in the signature database for the signature download:

- Delta Download—Downloads only the updates from the previously downloaded version.
- Full Download—Downloads the complete signature database; the download might take a longer amount of time.

All of the downloaded signatures are created in the system domain in read-only mode. The configurations that are downloaded are also saved in the system domain.

Security Director sends the full signature database update if any one of the following scenarios is true:

- You install an older version of the signature files.
- The corresponding diff files do not exist.
- A signature file is added using the offline update.

You can perform an offline update of the signature database files by downloading the latest signature version from <https://services.netscreen.com/space/2/latest/latest-space-update.zip> and storing it locally.

You can configure the signature database settings to install the latest signature on to the device. Once the latest signatures are available, you can use them to configure application services.

Signature Database Main Page Fields

Use the signature database main page to get an overall, high-level view of your signature database settings. You can filter and sort this information to get a better understanding of what you want to configure. [Table 364 on page 1124](#) describes the fields on this page.

Table 364: Signature Database Main Page Fields

Field	Description
Active Database on Space	
Database Version	Version of signature database.
Publish Date	Date when the signature database was published.
Update Job	Job ID that you can use to update job details in the Job Management page.
Installed Device Count	Number of devices installed.
Detectors	Version number of the IPS protocol detector currently running on the device.
Action	Install signature database configuration.
Scheduled Download	Displays the time set to download the signature database settings.
Latest List of Signatures	
Database Version	Version of latest signature database.
Publish Date	Date when the signature database was published.

Table 364: Signature Database Main Page Fields (*continued*)

Field	Description
Update Summary	Display list of updated signature details for the selected database.
Detectors	Version number of the IPS protocol detector currently running on the device.
Action	<ul style="list-style-type: none"> • Delta Download–Download only the updates from the previously downloaded signature database version. • Full Download–Download the complete signature database; the download might take a while to complete.
Download History	
User Name	Name of the user who downloaded the signature database.
User IP	IP address of the user host where the download was done.
Task Name	Name of the task. For example, Download IPS/Application Signatures.
Timestamp	Time details when the signature database was downloaded.
Result	Successful or failed status of the signature database download.
Description	Description of the download task.

RELATED DOCUMENTATION

[Understanding Signature Databases | 1123](#)

[Using the Signature Database | 1122](#)

Installing the Signature Database Configuration

Once the signature database is downloaded, you can install the active database.

Security Director sends the full signature database update if any one of the following scenarios is true:

- You install an older version of the signature files.
- The corresponding diff files do not exist.
- A signature file is added using the offline update.

When you do not have an Internet connection to download the package, you can perform an offline update of the signature database files by downloading the latest signature version from <https://services.netscreen.com/space/2/latest/latest-space-update.zip> and storing it locally.

To install the signature database:

1. Select **Administration > Signature Database**.

2. Click **Install Configuration**.

The Install Configuration page appears.

3. You can view the summary of active signature database version, which will be installed on your device.

4. Click the check box next to the devices on which you want to install the signature database.

You can select **Full Probe** or **Delta Probe** from Probe Devices or by right-clicking the selected device to validate the intrusion prevention system (IPS) and application firewall licenses.

5. Enable **Incremental Update** to perform an incremental update or a full update of the signature database for the selected device.

6. Select **Run now** to set the signature database to automatically install immediately.

7. Select **Schedule** at a later time to set the signature database to automatically install at the specified time and to take the following actions:

- a. Choose a date by clicking the date picker icon.
- b. Enter the time.
- c. Select the time format from the drop-down menu.

8. Select the **Recurrence** check box to enable the schedule to recur in a given time interval.

9. Click **OK**.

The signature database configuration installation is complete.

RELATED DOCUMENTATION

[Understanding Signature Databases | 1123](#)

[Downloading the Signature Database Configuration | 1127](#)

Downloading the Signature Database Configuration

The following download options are available for the signature database configuration download:

- **Delta Download**—Downloads only the updates from the previously downloaded version.
- **Full Download**—Downloads the complete signature database; the download might take a longer amount of time.

To download the signature database configuration:

1. Select **Administration > Signature Database**.

2. Click **Download Configuration**.

The Download Configuration page appears.

3. Enter the destination URL where you want to download the IPS and AppFw signature database in the Download URL field. For example, <https://services.netscreen.com>.

4. Enable the Proxy Server field to send the download configuration traffic.

5. Select **Run now** to automatically download the signature database immediately.

6. Select **Schedule at a later time** to set the signature database to automatically download at the specified time and to take the following actions:

- a. Choose a date by clicking the date picker icon.
- b. Enter the time.
- c. Select the time format from the drop-down menu.

7. Select the **Recurrence** check box to enable the schedule to recur in a given time interval.

8. Click **OK**.

All the downloaded signatures are created in the System domain in read-only mode. The configuration that are downloaded are also saved in the System domain.

[Using the Signature Database | 1122](#)

[Installing the Signature Database Configuration | 1125](#)

[Uploading the Signature Database Configuration from a File System | 1128](#)

Uploading the Signature Database Configuration from a File System

You can upload the signature database if you do not have a latest version of the database updates. You can get the latest version of the database file at:

<https://services.netscreen.com/space/2/latest/latest-space-update.zip>.

To upload the signature database:

1. Select **Administration**> **Signature Database**.
2. Click Upload From File System.
3. Browse and select the attack bundle, which consists of the latest signature versions available at the time.
4. Click Upload to upload the signature to Security Director.

Once the upload is completed, you can install the latest signature file version on to a device.

Migrating Content from NSM to Security Director

IN THIS CHAPTER

- [NSM Migration](#) | 1129

NSM Migration

Starting in Junos Space Security Director Release 16.2, you can migrate firewall and NAT policies from Network and Security Manager (NSM) to Security Director for a set of devices. All objects supported by Security Director (addresses, services, address groups, service groups, and schedulers) can be imported with the policy, with the exception of polymorphic objects. Rules referring to unsupported objects are disabled after the migration. For example, if a firewall policy rule is configured with the VPN tunnel or if a NAT pool is configured with a routing instance, such rules are disabled after the migration.

At any time, only a single migration from the NSM workflow can be triggered on Security Director.

[Figure 160 on page 1130](#) shows the device import workflow.

Figure 160: High-Level Device Import Workflow

You can migrate policies from the NSM database (for the NSM Release 2010.3 to Release 2012.2) into Security Director.

The following NSM features are supported during the migration:

- Firewall policies with global rules (including support for the global address book)
- NAT policies with support for the global address book
- Nested address group support (Junos OS Release 11.2 and later)
- Negate address group support in firewall rules
- Service offload support in firewall rules
- Source address or source port option in static NAT
- Source port option in source NAT

NOTE: NSM to Security Director migration is not supported for ScreenOS devices.

Before You Begin

Migrating policies from NSM requires the NSM database to be exported in .xdiff format. You must copy this file to your local machine and provide its path to migrate policies from NSM to Security Director.

To import policies from NSM:

1. Select **Administration > NSM Migration**.

The Migration From NSM page appears.

2. Click **Launch**.

The NSM Migration page appears.

3. Browse to the path where the .xdiff file is stored, and select the appropriate .xdiff file generated from NSM. Click **OK** to import the .xdiff file to the Security Director server.

The Devices page appears showing the name of the available devices, the IP address of each device, the Junos OS version of each device, the platform, the device family, and the domain.

4. Select the devices for which you want to import the policies, and click **Next**.

The Managed Services summary page appears. This page provides the following information.

- Policy name and type (firewall or NAT)
- Number of rules with errors or warnings
- Summary that includes:
 - Number of IP addresses, services, or NAT pool objects
 - Rules with unsupported objects

5. Select the policy that you want to import, and click **Next**.

The Conflict Resolution page appears showing a list of conflicts, if any. An object conflict occurs when the name of the object to be imported matches an existing object, but the definition of the object does not match.

Conflicting objects can be IP addresses, services, or NAT pool objects. You can take the following actions for the conflicting objects:

- Rename object—Give the conflicting object a new name.
- Overwrite with imported value—Overwrite the existing object with the new object.

- Keep existing object—Keep the existing object, and ignore the new object.

Once the initial naming conflict has been resolved, the object conflict resolution checks for further conflicts with the new name and definition until resolution is complete.

NOTE: If Security Director finds further conflicts, the Conflict Resolution page is refreshed to display the new conflicts.

6. After all object conflicts are resolved, click **Finish**.

After the import is complete, a comprehensive report for each policy imported is available. You can download the summary report from your browser to your local machine. The summary report is saved as SummaryReport.zip.

7. Go to the Firewall Policy or NAT Policy workspace to view the imported policies. Security Director creates a group policy without associating any devices with it. You can continue to import policy objects for all other devices. All imported device policies will show up as group policies in Security Director. You can perform all normal firewall or NAT policy functions on these imported policies.

NOTE:

- If a group has more than 300 rules, Security Director automatically breaks the group into multiple rule groups, each containing 400 rules. The only exception is that these groups are placed last in the list of groups. The size of the last group is calculated by the upper threshold of 300 rules and lower threshold of 100 rules.
- _DE is affixed to the device specific policies name by Security Director. You cannot directly assign device specific policies to a group policy. Assign devices to the device specific policies first, and then assign those devices to the group policies.
- _PRE is affixed to the group policy names that are added before the device specific policies and _POST is affixed to the group policy names that are added after the device specific policies.

Release History Table

Release	Description
16.2	Starting in Junos Space Security Director Release 16.2, you can migrate firewall and NAT policies from Network and Security Manager (NSM) to Security Director for a set of devices.
