FCC Statement

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. The equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: The equipment described in this manual generates and may radiate radio-frequency energy. If it is not installed in accordance with Juniper Networks’ installation instructions, it may cause interference with radio and television reception. This equipment has been tested and found to comply with the limits for a Class B digital device in accordance with the specifications in part 15 of the FCC rules. These specifications are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Consult the dealer or an experienced radio/TV technician for help.
- Connect the equipment to an outlet on a circuit different from that to which the receiver is connected.

Caution: Changes or modifications to this product could void the user's warranty and authority to operate this device.

About This Guide

The Juniper Networks NetScreen-5000 Series consists of purpose-built, high-performance security systems that provide IPSec VPN and firewall services for large-scale carrier, enterprise, and data-center networks. Built around NetScreen’s third- and fourth-generation ASIC technology and distributed system architecture, the NetScreen-5000 Series offers excellent scalability and flexibility.

The NetScreen-5000 Series includes the following device models:

- NetScreen-5200, a chassis-based, two-slot network security device
- NetScreen-5400, a chassis-based, four-slot network security device

NetScreen-5000 Series architecture features multiple processing modules. These include a management module that provides overall system control, and security processing modules that allow a variety of port configurations. Together, these modules provide a wide range of performance and security gateway configurations. Because the modules can work in many combinations, you can customize the NetScreen-5000 Series to accommodate the specific requirements of your organization.

The NetScreen-5000 Series also employs a switch fabric for data exchange and a separate multi-bus channel for control information, thus delivering scalable performance for the most demanding environments.

NOTE: The configuration instructions and examples in this document are based on the functionality of a device running ScreenOS Release 6.1.0. Your device might function differently depending on the ScreenOS version you are running. For the latest device documentation, refer to the Juniper Networks Technical Publications website at [www.juniper.net/techpubs/hardware](http://www.juniper.net/techpubs/hardware). To see which ScreenOS versions are currently available for your device, refer to the Juniper Networks Support website at [http://www.juniper.net/customers/support/](http://www.juniper.net/customers/support/).
Guide Organization

This manual contains the following sections:

- Chapter 1, “Overview,” provides a detailed overview of the system, its modules, Fast Ethernet (FE) connectors and Small Form factor Pluggable (SFP) sockets, power supplies, and fan tray.

- Chapter 2, “Installing the Device,” details how to rack mount the NetScreen-5000 Series, connect the power supplies, and connect the modules to the network in addition to providing desktop site requirements and guidelines for rack mounting.

- Chapter 3, “Configuring the Device,” details how to obtain an IP address for an interface on one of the modules and how to aggregate ports on one of the modules.

- Chapter 4, “Servicing the Device,” provides procedures on how to replace your module and power supplies.

- Appendix A, “Specifications,” provides a list of physical specifications about the NetScreen-5000 Series, the modules, and power supplies.

- Appendix B, “Port Descriptions and LED Status,” provides descriptions of port and LED behavior.

Web User Interface Conventions

The Web user interface (WebUI) contains a navigational path and configuration settings. To enter configuration settings, begin by clicking a menu item in the navigation tree on the left side of the screen. As you proceed, your navigation path appears at the top of the screen, with each page separated by angle brackets.

The following example shows the WebUI path and parameters for defining an address:

Policy > Policy Elements > Addresses > List > New: Enter the following, then click OK:

Address Name: addr_1
IP Address/Domain Name:
  IP/Netmask: (select), 10.2.2.5/32
Zone: Untrust

To open online Help for configuration settings, click the question mark (?) in the upper left of the screen.

The navigation tree also provides a Help > Config Guide configuration page to help you configure security policies and Internet Protocol Security (IPSec). Select an option from the list and follow the instructions on the page. Click the ? character in the upper left for Online Help on the Config Guide.

Command Line Interface Conventions

The following conventions are used to present the syntax of command line interface (CLI) commands in text and examples.

In text, commands are in **boldface** type and variables are in *italic* type.
In examples:

- Variables are in italic type.
- Anything inside square brackets [] is optional.
- Anything inside braces {} is required.
- If there is more than one choice, each choice is separated by a pipe (|). For example, the following command means “set the management options for the ethernet1, the ethernet2, or the ethernet3 interface”:

  ```
  set interface { ethernet1 | ethernet2 | ethernet3 } manage
  ```

**NOTE:** When entering a keyword, you only have to type enough letters to identify the word uniquely. For example, typing `set admin user angel j12fmt54` is enough to enter the command `set admin user angel j12fmt54`. Although you can use this shortcut when entering commands, all the commands documented here are presented in their entirety.

### Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need postsales technical support, you can access our tools and resources online or open a case with JTAC.

- **JTAC policies**—For a complete understanding of our JTAC procedures and policies, review the [JTAC User Guide](http://www.juniper.net/customers/support/downloads/710059.pdf) located at http://www.juniper.net/customers/support/downloads/710059.pdf.
- **Product warranties**—For product warranty information, visit [http://www.juniper.net/support/warranty/](http://www.juniper.net/support/warranty/).
- **JTAC hours of operation**—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

### Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- **Find CSC offerings**—[http://www.juniper.net/customers/support/](http://www.juniper.net/customers/support/)
- **Find product documentation**—[http://www.juniper.net/techpubs/](http://www.juniper.net/techpubs/)
- **Find solutions and answer questions using our Knowledge Base**—[http://kb.juniper.net/](http://kb.juniper.net/)
- **Download the latest versions of software and review your release notes**—[http://www.juniper.net/customers/csc/software/](http://www.juniper.net/customers/csc/software/)
- Search technical bulletins for relevant hardware and software notifications—
  http://www.juniper.net/alerts/
- Join and participate in the Juniper Networks Community Forum—
  http://www.juniper.net/company/communities/
- Open a case online in the CSC Case Manager—
  http://www.juniper.net/customers/cm/
- To verify service entitlement by product serial number, use our Serial Number
  Entitlement (SNE) Tool—
  https://tools.juniper.net/SerialNumberEntitlementSearch/

**Opening a Case with JTAC**

You can open a case with JTAC on the Web or by telephone.

- Use the Case Manager tool in the CSC at http://www.juniper.net/customers/cm/.
- Call 1-888-314-JTAC (1-888-314-5822)—toll free in USA, Canada, and Mexico.

For international or direct-dial options in countries without toll-free numbers, visit us at
http://www.juniper.net/customers/support/requesting-support/.

**Feedback**

If you find any errors or omissions in this document, contact Juniper Networks at
techpubs-comments@juniper.net.
Chapter 1
Overview

This chapter provides detailed descriptions of the NetScreen-5000 Series devices, modules, power supplies, and fan assemblies. It includes the following sections:

- “NetScreen-5000 Series” on page 11
  - “NetScreen-5200” on page 11
  - “NetScreen-5400” on page 12
- “Power Supplies” on page 13
  - “NetScreen-5200 Power Recommendations” on page 13
  - “NetScreen-5400 Power Recommendations” on page 13
  - “DC Power Supply” on page 13
  - “AC Power Supply” on page 14
- “Fan Modules” on page 15
- “NetScreen-5000 Modules” on page 15
  - “Management Modules” on page 16
  - “Secure Port Modules” on page 17

NetScreen-5000 Series

This section describes NetScreen-5000 Series devices, which include the NetScreen-5200 and the NetScreen-5400.

NetScreen-5200

The NetScreen-5200 is a chassis-based, two-slot network security device with a 2U (rack unit) chassis. Slot 1 is for the management module and Slot 2 is for the Secure Port Module (SPM). The device has two hot-swappable power supplies for power redundancy and a removable fan module.
Figure 1 shows a NetScreen-5200 with a management module in slot 1 (top) and an SPM in slot 2 (bottom).

Figure 1: NetScreen-5200 Front Panel

NetScreen-5400

The NetScreen-5400 is a chassis-based, four-slot network security device with a 5U (rack unit) chassis. The top slot (slot 1) holds the management module, and the bottom slots (slots 2-4) hold up to three Secure Port Modules (SPMs) for flexible, high-density port configurations. The device has three hot-swappable power supplies for power redundancy and a removable fan module.

Figure 2 shows a NetScreen-5400 fully populated with a management module in slot 1 (top) and SPMs in slots 2 through 4.

Figure 2: NetScreen-5400 Front Panel
Power Supplies

The NetScreen-5000 Series can use AC or DC power supplies. The slots for these power supplies are located in the back of the NetScreen-5200 and on the front of the NetScreen-5400.

**NOTE:** You can order a NetScreen-5000 Series that runs on DC power. For DC-powered units, the power supply has a DC terminal block with three sockets.

When two or more power supplies are in service, they share the power load equally. The power supplies are hot-swappable, so you can remove one and replace it without affecting device operation. Each power supply is intended to receive power from separate feeds.

When one power supply fails, the other(s) automatically assume the full load and the device logs a system alarm. This alarm is viewable through the WebUI or a console accessing the ScreenOS CLI. The Alarm LED on the management module glows red in response to any power supply failure.

**WARNING:** You must replace the failed power supply as soon as possible; otherwise, system damage can occur. See “Servicing the Device” on page 47 for instructions on how to replace a power supply.

**NetScreen-5200 Power Recommendations**

Although the NetScreen-5200 can run with one power supply, it is advisable to install both. This practice minimizes the likelihood of system failure due to individual power supply failure.

When either power supply fails, the Alarm LED on the management module glows red. If both are operational, then the Alarm LED is off. For more information on power supply LEDs, see “Port Descriptions and LED Status” on page 63.

**NetScreen-5400 Power Recommendations**

When the NetScreen-5400 contains only two modules, it can operate with one power supply. However, if the system contains three or four modules, the system requires at least two power supplies. In either case, it is advisable to install all three power supplies. This practice minimizes the likelihood of system failure caused by individual power supply failure.

When any power supply fails, the Alarm LED on the management module glows red. While all three are operational, the Alarm LED is off. For more information on power supply LEDs, see “Port Descriptions and LED Status” on page 63.

**DC Power Supply**

The DC power supply weighs about three pounds. The faceplate contains a power LED, a power switch, a cooling fan vent, and three DC power terminal blocks that connect to power cables.
Figure 3 shows the NetScreen-5200 DC power supply.

**Figure 3: NetScreen-5200 DC Power Supply**

**AC Power Supply**

The AC power supply weighs about three pounds. The faceplate contains a power LED, a power switch, a male power outlet, and a cooling fan vent.

Figure 4 shows the NetScreen-5200 AC power supply.

**Figure 4: NetScreen-5200 AC Power Supply**
Fan Modules

The NetScreen-5200 has a three-fan module and the NetScreen-5400 has a two-fan module. You can access the fan module from the left front side of each chassis.

- To remove the NetScreen-5200 fan module, turn the fan knob in the unlock position, then gently pull the fan module lever toward you to slide the module out.

- To remove the NetScreen-5400 fan module, loosen the two thumb screws that secure the fan module, then gently slide the module out.

If a fan stops operating due to failure or removal, then the system continues to run and generates an alarm. When you replace the fan, do not leave the fan tray empty for more than two minutes. See “Replacing the Fan Module” on page 50 for more information.

NetScreen-5000 Modules

The NetScreen-5000 Series systems support two module types:

- NetScreen-5000 management modules
- NetScreen-5000 Secure Port Modules (SPMs)

Table 1 shows the modules supported by each slot.

Table 1: Modules Supported by Each Slot in a NetScreen-5000 Series Device

</tbody>
</table>
Management Modules

The management module provides general-purpose CPU delivery and contains dedicated high availability (HA) and management interfaces. It handles tasks such as management access, session setup and termination, and Internet Key Exchange (IKE) negotiation.

The management module assists other system elements, primarily with non-flow related tasks. It provides overall management and control of the system. Although it performs system management, the primary function of the management module is to support the other modules.

Table 3 shows the management module specifications.

</table>

Features of the management module include:

- A management port, for WebUI management or CLI sessions
- An RJ-45 console port, for connecting serial terminal emulation programs such as HyperTerminal
- Two HA ports
- A modem port

The management module also has port Link and Activity LEDs, CPU utilization indicators, a high availability (HA) LED, an Alarm LED, a Status LED, a Flash LED, and a Power LED. In addition, it has a compact flash slot for flash memory card installation. See “Port Descriptions and LED Status” on page 63 for descriptions of the LED lights.

Figure 5 shows the NetScreen-5000 series management module.
Secure Port Modules

Secure Port Modules (SPMs) perform general packet processing and device connection tasks for devices that communicate with the NetScreen-5000 Series.

SPMs handle packets as they enter and exit the system, providing packet parsing, classification, and flow-level processing. SPMs also provide encryption, decryption, Network Address Translation (NAT), and session lookup features. When packets require processing beyond that provided by an SPM, the NetScreen-5000 Series hands them off to the management module for further processing.

There are currently three families of SPMs:

- The 5000-8G, 5000-8G2, and 5000-8G2-G4 SPMs provide eight 1-Gigabit Small Form factor Pluggable (SFP) sockets. These SPMs are supplied with SX gigabit fiber SFP transceivers.
- The 5000-2XGE and 5000-2XGE-G4 SPMs provide two 10-Gigabit Form factor Pluggable (XFP) sockets. You must purchase transceivers for this SPM separately.
- The 5000-2G24FE SPM provides two SFP sockets and 24 10/100 Ethernet ports. This SPM is supplied with two SX gigabit fiber SFP transceivers.

**NOTE:** Juniper strongly recommends the use of Juniper transceivers. Juniper cannot guarantee correct operation if non-Juniper transceivers are used. The transceiver type can be different in each port, as long as a supported part number is used.

**5000-8G, 5000-8G2 and 5000-8G2-G4 SPMs**

The 5000-8G, 5000-8G2 and 5000-8G2-G4 SPMs provide eight 1-Gigabit SFP sockets for hot-swappable transceivers. These modules are also capable of supporting a total of four aggregate interfaces, with up to four ports for each aggregate interface.

Table 4 shows the capacities that are available with the 55000-8G, 5000-8G2 and 5000-8G2-G4 SPMs.
The 5000-8G SPM provides port Link and Activity LEDs in addition to Power and Status LEDs.

Figure 6 shows the NetScreen-5000 series secure port module.

Figure 6: 5000-8G Secure Port Module (5000-8G2 and 5000-8G2-G4 Similar)

**Table 4: Capacities and Management Modules, 5000-8G, 5000-8G2 and 5000-8G2-G4 SPMs**

<td>5000-MGT3 Only</td>
</tr>
</tbody>
</table>

(For details on connecting or removing a SFP transceivers and connecting and disconnecting Gigabit Ethernet cables, see “Servicing the Device” on page 47.)

**5000-2XGE and 5000-2XGE-G4 SPMs**

The 5000-2XGE and 5000-2XGE-G4 SPMs provide two 10-Gigabit XFP sockets for hot-swappable transceivers. You cannot mix this SPM with the 5000-8G or 5000-2G24FE SPMs.

Table 5 shows the capacities that are available with the 5000-2XGE and 5000-2XGE-G4 SPMs.

**Table 5: Capacities and Management Modules, 5000-2XGE and 5000-2XGE-G4 SPMs**

</tbody>
</table>

NOTE: Juniper strongly recommends the use of Juniper transceivers. Juniper cannot guarantee correct operation if non-Juniper transceivers are used. The transceiver type can be different in each port, as long as a supported part number is used.

5000-2G24FE SPM

The 5000-2G24FE SPM provides two 1-Gigabit Ethernet SFP sockets and 24 Fast Ethernet (FE) ports with up to 2 Gbps of firewall and up to 1 Gbps of VPN process capacity. This module supports a total of six aggregate interfaces. This total consists of one aggregate interface for the two 1-Gigabit SFP Sockets, and five aggregate interfaces for the 24 10/100 Ethernet ports. Only similar ports can be aggregated together. For example, you cannot aggregate a Gigabit SFP port to a 10/100 FE port.

The 5000-2G24FE SPM is only supported by the 5000-M and 5000-M2 management modules. Also, you cannot mix this SPM with the 5000-8G2 or 5000-2XGE SPMs.

The 5000-2G24FE provides port Link and Activity LEDs, in addition to Power and Status LEDs.

SFP transceivers are hot-swappable. For details on inserting or removing SFP transceivers and connecting or disconnecting Gigabit Ethernet cables, see “Servicing the Device” on page 47.

Figure 8 shows the NetScreen-5000-2G24FE secure port module.

Chapter 2
Installing the Device

This chapter describes how to install a NetScreen-5000 Series in an equipment rack or on a desktop and how to configure the device on a network. This chapter includes the following sections:

- “General Installation Guidelines” on page 21
- “Equipment Rack Installation Guidelines” on page 22
- “Mounting the NetScreen-5000 Series” on page 23
  - “NetScreen-5200 Front-and-Rear Mount” on page 23
  - “NetScreen-5200 Center-Mount” on page 25
  - “NetScreen-5400 Front-Mount” on page 26
- “Installing and Connecting an AC Power Supply” on page 27
- “Installing and Wiring a DC Power Supply” on page 28
- “Establishing a High Availability Connection” on page 29
- “Connecting the NetScreen-5000 Series to a Router or Switch” on page 30

General Installation Guidelines

Observing the following precautions can prevent injuries, equipment failures, and shutdowns:

- Never assume that the power supply is disconnected from a power source. Always check first.

- Room temperature might not be sufficient to keep equipment at acceptable temperatures without an additional circulation system. Ensure that the room in which you operate the NetScreen-5000 Series has adequate air circulation.

- Do not work alone if potentially hazardous conditions exist.

- Look carefully for possible hazards in your work area, such as moist floors, ungrounded power extension cables, frayed power cords, and missing safety grounds.
Equipment Rack Installation Guidelines

The location of the chassis and the layout of your equipment rack or wiring room are crucial for proper system operation.

Use the following guidelines while configuring your equipment rack:

- Enclosed racks must have adequate ventilation. An enclosed rack should have louvered sides and a fan to provide cooling air.
- When mounting a chassis in an open rack, ensure that the rack frame does not block the intake or exhaust ports. If you install the chassis on slides, then check the position of the chassis when it is seated all the way into the rack.
- In an enclosed rack with a ventilation fan in the top, equipment higher in the rack can draw heat from the lower devices. Always provide adequate ventilation for equipment at the bottom of the rack.
- Baffles can isolate exhaust air from intake air. The best placement of the baffles depends on the airflow patterns in the rack.

You can mount the device in a standard 19-inch equipment rack. Rack mounting requires the following tools:

- Phillips screwdriver
- Rack-compatible screws
- The included rear slide kit (for the front-and-rear mount method) on the NetScreen-5200
- Front-mount brackets

There are two ways to rack-mount the NetScreen-5200:

- Front-and-rear mount (recommended)
- Center-mount

You can only front-mount the NetScreen-5400.

NOTE: Although you can place the NetScreen-5000 Series on a desktop for operation, we do not recommend deploying it in this manner.

To prevent abuse and intrusion by unauthorized personnel, it is extremely important to install the security device in a locked-room environment.
Mounting the NetScreen-5000 Series

The following sections describe how to rack-mount the NetScreen-5000 Series:

- “NetScreen-5200 Front-and-Rear Mount” on page 23
- “NetScreen-5200 Center-Mount” on page 25
- “NetScreen-5400 Front-Mount” on page 26

*NetScreen-5200 Front-and-Rear Mount*

To mount the NetScreen-5200 with support from the front and rear, you need four fitted screws, a phillips screwdriver, the rear slide kit, and brackets.

To front-and-rear mount the device:

1. Use the screws provided to install the slides and rack mount brackets to the sides of the chassis as shown in Figure 9.

*Figure 9: Installing the NetScreen-5200 Slides and Rack Mount Brackets*
2. Use the screws to attach the rear mount bracket to the rear rack posts.

3. Slip the slides into the rear mount brackets, then push the NetScreen-5200 forward until the left and right brackets contact the front rack posts, as shown in Figure 10.

**Figure 10: Rack Mounting the NetScreen-5200**

4. Use the screws to attach the left and right brackets to the rack.
NetScreen-5200 Center-Mount

To center-mount the NetScreen-5200, you need four fitted screws, a phillips screwdriver, and brackets.

To center-mount the device:

1. Use the screws to attach the left and right brackets to the middle of each side of the chassis, as shown in Figure 11.

Figure 11: Installing NetScreen-5200 Rack Brackets for Center Mounting

2. Use the screws to attach the left and right brackets to the rack, as shown in Figure 12.

Figure 12: Center-mounting the NetScreen-5200
**NetScreen-5400 Front-Mount**

To front-mount the NetScreen-5400, you need four fitted screws, a phillips screwdriver, and brackets.

To front-mount the device:

1. Use the screws to attach the front-mount bracket to the front of the chassis as shown in Figure 13.

*Figure 13: Installing NetScreen-5400 Rack Brackets*
2. Use the screws to attach the left and right brackets to the rack as shown in Figure 14.

**Figure 14: Rack Mounting the NetScreen-5400**

---

**Installing and Connecting an AC Power Supply**

To install and connect an AC power supply to the NetScreen-5000 Series device:

1. On the NetScreen-5200, slide the power supply into one of the power compartments in the back of the system.

   On the NetScreen-5400, slide the power supply into one of the power compartments on the front of the system.

2. Fasten the power supply to the system by tightening the corner screws into the eyelets on the sides of the power supply.

3. If you want to install two power supplies in the NetScreen-5200 or three power supplies in the NetScreen-5400, then repeat steps 1 and 2 for the remaining power supplies.

4. Connect the female end of a standard power cord to the male connector on the back of each power supply.

5. Connect each power cord to a standard 100-240-Volt power outlet.
NOTE: Whenever you deploy two or more power supplies to a NetScreen-5000 Series system, connect each to a different power source. Each power supply is intended to receive power from separate feeds.

6. Turn the power switches on.

NOTE: If there are multiple power supplies in the NetScreen-5000 Series system and any of them are off, then the Alarm LED on the management module glows red. This alarm indicates that maximum system stability requires all installed power supplies to be operational.

Installing and Wiring a DC Power Supply

To install and connect the DC power supply to the NetScreen-5000 Series system:

1. On the NetScreen-5200, slide the power supply into one of the power compartments in the back of the system.

   On the NetScreen-5400, slide the power supply into one of the power compartments on the front of the system.

2. Fasten the power supply to the system by tightening the corner screws into the eyelets on the sides of the power supply.

3. If you want to install two power supplies in the NetScreen-5200 or three power supplies in the NetScreen-5400, then repeat steps 1 and 2 for the remaining power supplies.

The DC power supply, power switch, grounding screw, and terminal blocks, are located on the faceplate of the power supply unit.

Figure 15: NetScreen-5200 DC Power Supply
To connect the DC power supply to a grounding point at your site:

1. Remove the hex nut on the grounding screw.
2. Place the ground lug on the screw and tighten the hex nut securely.
3. Connect the other end of the grounding lug wire to a grounding point at your site.

To connect DC power feeds to the terminal blocks:

1. Loosen the retaining screws on each terminal block.
2. Insert the 0V DC (positive voltage) return wire into the center COM connector and the -48V DC power feed wire into either the left or right connector.
3. Fasten the screws over the connectors.
4. Turn the power switches on.

**NOTE:** If there are multiple power supplies in the NetScreen-5000 Series system and any of them are off, then the Alarm LED on the management module glows red. This alarm indicates that maximum system stability requires all installed power supplies to be operational.

**Establishing a High Availability Connection**

To ensure continuous traffic flow in the event of a system failure, you can cable and configure two security devices in a redundant cluster, with one device acting as a master and the other as its backup. The master propagates all its network, configuration and session information to the backup. Should the master fail, the backup is promoted to master and takes over the traffic processing.

To physically connect the master and backup devices, the management modules provide a pair of high availability (HA) ports. To connect the NetScreen-5000 Series systems, you can use the provided Gigabit Ethernet SFP cable. Use this cable to connect the HA1 port on one system to the HA1 port on another system. Though you cannot connect HA ports between 5000-M and 5000-M2 management modules, you can connect HA ports between the same type of management module. For example, a 5000-M management module to another 5000-M management module.

For information on setting up HA configurations, refer to the *Concepts & Examples ScreenOS Reference Guide.*
Connecting the NetScreen-5000 Series to a Router or Switch

You can establish a high-speed connection to a router or switch, and provide firewall and general security for your network, by connecting a Secure Port Module (SPM) to a fiber-optic or copper wire backbone. There are two ways to create this connection:

- Connect a fiber-optic cable from one of the SFP ports to the router (or switch).
- Connect an unshielded twisted pair (UTP) CAT5 cable from an FE port to the router (or switch).

**WARNING:** Certain ports on the device are designed for use as intrabuilding (within-the-building) interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE, Issue 4) and require isolation from the exposed outside plant (OSP) cabling. To comply with NEBS requirements and protect against lightning surges and commercial power disturbances, the intrabuilding ports must not be metallically connected to interfaces that connect to the OSP or its wiring. The intrabuilding ports on the device are suitable for connection to intrabuilding or unexposed wiring or cabling only. The addition of primary protectors is not sufficient protection for connecting these interfaces metallically to OSP wiring.

**CAUTION:** To comply with intrabuilding lightning and surge requirements, intrabuilding wiring must be shielded, and the shield for the wiring must be grounded at both ends.
Chapter 3
Configuring the Device

This chapter describes how to perform initial configuration on the NetScreen-5000 Series once you have mounted it in a rack or desktop, plugged in the necessary cables, and turned the power on. Topics in this chapter include:

- “Operational Modes” on page 32
  - “Transparent Mode” on page 32
  - “Route Mode” on page 32
- “NetScreen-5000 Interfaces” on page 33
  - “NetScreen-5200 Interfaces” on page 33
  - “NetScreen-5400 Interfaces” on page 34
  - “Configurable Interfaces” on page 35
- “Performing Initial Connection and Configuration” on page 35
  - “Establishing a Terminal Emulator Connection” on page 35
  - “Upgrading the Firmware During the Startup Process” on page 37
  - “Changing Your Admin Name and Password” on page 38
  - “Setting Port and Interface IP Addresses” on page 38
- “Configuring the Device for Telnet and WebUI Sessions” on page 40
  - “Starting a Console Session Using Telnet” on page 40
  - “Starting a Console Session Using Dialup” on page 41
  - “Establishing a GUI Management Session” on page 41
Operational Modes

The NetScreen-5000 Series supports two operational modes: Transparent and Route. The default mode is Route.

**Transparent Mode**

In Transparent mode, a NetScreen-5000 Series system operates as a Layer-2 bridge. Because the device cannot translate packet IP addresses, it cannot perform Network Address Translation (NAT). Consequently, for the device to access the Internet, any IP address in your trusted (local) networks must be routable and accessible from untrusted (external) networks.

In Transparent mode, the IP addresses for the Layer-2 Trust and Untrust zones are 0.0.0.0, thus making the NetScreen-5000 Series system invisible to the network. However, the device can still perform firewall, VPN, and traffic management according to configured security policies.

**Route Mode**

In Route mode, a NetScreen-5000 Series system operates at Layer 3. Because you can configure each interface using an IP address and subnet mask, you can configure individual interfaces to perform NAT.

- When the interface performs NAT services, the NetScreen-5000 Series system translates the source IP address of each outgoing packet into the IP address of the untrusted interface. It also replaces the source port number with a randomly generated value.

- When the interface does not perform NAT services, the source IP address and port number in each packet header remain unchanged. Therefore, to reach the Internet your local hosts must have routable IP addresses.

For more information on NAT, refer to the Concepts & Examples ScreenOS Reference Guide.
NetScreen-5000 Interfaces

Each Secure Port Module (SPM) for the NetScreen-5000 Series system provides 2, 8, or 26 physical Ethernet ports. Each of these ports can serve as a physical interface. In addition, you can configure the Ethernet ports to host multiple virtual (logical) interfaces.

NetScreen-5200 Interfaces

A NetScreen-5200 contains one management module (in slot 1) and one SPM. In Figure 16, the device contains one 5000-8G SPM.

NOTE: Not all SPMs are supported by every management module. See Table 3, “Netscreen 5000-series Management Modules,” on page 16 for more information.

Figure 16: NetScreen-5200 Interfaces
NetScreen-5400 Interfaces

A NetScreen-5400 contains one management module (in slot 1) and up to three SPMs. In Figure 17, the device contains three 5000-8G SPMs.

NOTE: Not all SPMs are supported by every management module. See Table 3, “NetScreen 5000-series Management Modules,” on page 16 for more information.
Performing Initial Connection and Configuration

To establish the first console session with the NetScreen-5000 Series system, use a vt100 terminal emulator program through the provided RJ-45/DB9 serial port connector.

Establishing a Terminal Emulator Connection

To establish an initial console session:

1. Plug the DB-9 end of the supplied RJ-45/DB-9 serial cable into the serial port of your workstation. (Be sure that the DB-9 is seated properly and secured with the screws.)

2. Plug the RJ-45 end of the cable into the Console port of the NetScreen-5000 Series system as shown in Figure 18. (Be sure that the RJ-45 clip snaps into the port and is seated properly.)

Configurable Interfaces

Table 7 shows the configurable interfaces available on the NetScreen-5000 Series.

Table 7: NetScreen-5000 Series Configurable Interfaces

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet</td>
<td><code>etherneth1/n2</code> specifies a physical Ethernet interface, denoted by an interface module in a slot (n1) and a physical port (n2) on the module. <code>etherneth1/n2,n3</code> specifies a logical interface, denoted by an interface module in a slot (n1), a physical port (n2) on the module, and a logical interface number (n3). You create logical interfaces using the <code>set interface</code> command.</td>
</tr>
<tr>
<td>Layer-2</td>
<td><code>vlan1</code> specifies the interface used for management and VPN while the NetScreen-5000 Series system is in Transparent mode</td>
</tr>
<tr>
<td>Tunnel</td>
<td><code>tunnel</code> specifies a tunnel interface. Use this interface for VPN traffic</td>
</tr>
<tr>
<td>Function</td>
<td><code>mgt</code> specifies a dedicated management interface bound to the MGT zone</td>
</tr>
<tr>
<td></td>
<td><code>ha1</code> and <code>ha2</code> specify the names of the dedicated HA ports</td>
</tr>
</tbody>
</table>
3. Launch a CLI session between your workstation and the NetScreen-5000 Series system using a standard serial terminal emulation program such as Hilgraeve HyperTerminal (provided with the Microsoft Windows operating system). The settings should be as follows:

- Baud Rate to **9600**
- Parity to **No**
- Data Bits to **8**
- Stop Bit to **1**
- Flow Control to **none**

4. At the HyperTerminal window, press **Enter** to display the login prompt.

5. At the login prompt, enter **netscreen**.

6. At the password prompt, enter **netscreen**.

**NOTE:** Use lowercase letters only. The username and password are both case-sensitive.

7. (Optional) By default, the console times out and terminates automatically after 10 minutes of idle time. To change this timeout interval, use the following command:

```
set console timeout number
```

where **number** is the length of idle time in minutes before session termination. To prevent any automatic termination, specify a value of **0**.
Upgrading the Firmware During the Startup Process

1. Connect your computer to the NetScreen-5000 Series system:
   a. Using a serial cable, connect the serial port on your computer to the console port on the NetScreen-5000 Series system. This connection, in combination with a terminal application, enables you to manage the security device.
   b. Using an Ethernet cable, connect the network port on your computer to the management port on the NetScreen-5000 Series system. This connection enables the transfer of data between the computer, the TFTP server, and the security device.

2. Make sure that you have the new ScreenOS image file stored in the TFTP server directory on your computer. For information on obtaining the new firmware, refer to the Concepts & Examples ScreenOS Reference Guide.

3. Run the TFTP server on your computer by double-clicking on the TFTP server application. You can minimize its window but it must be active in the background.

4. Log into the NetScreen-5000 Series system using a terminal emulator such as HyperTerminal. See “Establishing a Terminal Emulator Connection” on page 35. Log in as the root admin or an admin with read-write privileges.

5. Power on or reboot the NetScreen-5000 Series system.

6. Keep your eyes on the terminal emulator screen, then when you see “Hit any key to load new firmware,” press any key on your computer keyboard to interrupt the startup.

   NOTE: If you do not interrupt the NetScreen-5000 Series system in time, it proceeds to load the firmware saved in flash memory.

7. At the Boot File Name prompt, enter the filename of the ScreenOS firmware you want to load.

8. At the Self IP Address prompt, enter the IP address of the NetScreen-5000 Series system that is used to communicate to the TFTP server.

9. At the TFTP IP Address prompt, enter the IP address of the TFTP server.

   If the firmware is loading successfully, you will see a series of “rtatatatata...” characters running on the terminal emulator screen and a series of symbols running on the TFTP server window. When the firmware installation is complete, a message informs you of the success of the installation.

10. Enter y (yes) to the following question: “Program to on-board flash” ([y]/n)”
    Entering yes saves the firmware you installed to flash memory.

11. Enter y (yes) to the following question: “Run downloaded program? ([y]/n)”
    Entering yes instructs the NetScreen-5000 Series system to start running the new ScreenOS firmware.
Changing Your Admin Name and Password

Because all Juniper Networks security products use the same admin name and password (netscreen), it is highly advisable to change your admin name and password immediately. Enter the following commands:

```
set admin name name_str
set admin password pswd_str
save
```

For information on creating different levels of administrators, refer to the Concepts & Examples ScreenOS Reference Guide.

Setting Port and Interface IP Addresses

Through the CLI, you can use commands that set IP address and subnet mask values for most of the physical interfaces.

Viewing Current Interface Settings

To begin the configuration process, it is advisable to view existing port settings with the following command:

```
get interface
```

This command displays current port names, IP addresses, MAC addresses, and other useful information.

Setting the IP Address of the Management Interface

The default IP address and subnet mask settings for the MGT interface are 192.168.1.1 and 255.255.255.0, respectively. To access the MGT interface, you must change the IP address and subnet mask of the MGT interface to match your current network. We recommend using the MGT interface exclusively for out-of-band management.

To set the IP address of the MGT interface:

1. Choose an unused IP address within the current address range of your LAN.
2. Set the MGT interface to this unused IP address with the following command:

```
set interface mgt ip ip_addr/mask
```

For example, to set the IP address and subnet mask of the MGT interface to 10.100.2.183 and 16, respectively:

```
set interface mgt ip 10.100.2.183/16
```

3. To confirm the new port settings, use the following command:

```
get interface mgt
```
Setting the IP Address for the Trust Zone Interface

The NetScreen-5000 Series system usually communicates with your protected network through an interface bound to the Trust zone. To allow an interface to communicate with internal devices, you must assign it the IP address and subnet mask for your protected network.

To set up the ethernet2/2 interface to communicate with your trusted network:

1. Determine the IP address and subnet mask of your trusted network.
2. Set the ethernet2/2 interface to the Trust zone with the following command:

   set interface ethernet2/2 zone trust

3. Set the IP address and subnet mask with the following command:

   set interface ethernet2/2 ip ip_addr/mask

   where ip_addr is the IP address and mask is the subnet mask. For example, to set the IP address and subnet mask of the ethernet2/2 interface to 10.250.2.1/16:

   set interface ethernet2/2 ip 10.250.2.1/16

4. (Optional) To confirm the new port settings, use the following command:

   get interface ethernet2/2

Setting the IP Address for the Untrust Zone Interface

The NetScreen-5000 Series system usually communicates with external (untrusted) devices through an interface bound to the Untrust zone. To allow an interface to communicate with external devices, you must assign it a public IP address.

To set up the ethernet2/3 interface to communicate with external devices:

1. Choose an unused public IP address and subnet mask.
2. Set the ethernet2/3 interface to the Untrust zone with the following command:

   set interface ethernet2/3 zone untrust

3. Set the IP address and subnet mask with the following command:

   set interface ethernet2/3 ip ip_addr/mask

   where ip_addr is the IP address and mask is the subnet mask. For example, to set the IP address and subnet mask of the ethernet2/3 interface to 172.16.20.1/16:

   set interface ethernet2/3 ip 172.16.20.1/16

4. (Optional) To confirm the new interface settings, use the following command:

   get interface ethernet2/3
Allowing Outbound Traffic

By default, the NetScreen-5000 Series system does not allow inbound or outbound traffic, nor does it allow traffic to or from the DMZ. To permit (or deny) traffic, you must create access policies.

The following CLI command creates an access policy that permits all kinds of outbound traffic, from any host in your trusted LAN to any device on the untrusted network.

```
set policy from trust to untrust any any any permit
```

Save your access policy configuration with the following command:

```
save
```

---

**CAUTION:** Your network might require a more restrictive policy than the one created in the example above. The example is not a requirement for initial configuration. For detailed information about access policies, refer to the Concepts & Examples ScreenOS Reference Guide.

---

Configuring the Device for Telnet and WebUI Sessions

In addition to terminal emulator programs, you can use Telnet (or dialup) to establish console sessions with a NetScreen-5000 Series system. You can also start management sessions using the ScreenOS WebUI, a web-based GUI management application.

**Starting a Console Session Using Telnet**

To establish a Telnet session with the NetScreen-5000 Series system:

1. Connect an RJ-45 cable from the MGT interface to the internal switch, router, or hub in your LAN.

2. Open a Telnet session, specifying the current MGT interface IP address. For example, in Windows, click **Start > Run**, enter `telnet ip_addr` (where `ip_addr` is the address of the MGT interface), then click **OK**.

   For example, if the MGT interface has an address of 10.100.2.183, use the following command:
   
   `telnet 10.100.2.183`

3. At the Username prompt, enter your username (the default is `netscreen`).

4. At the Password prompt, enter your password (the default is `netscreen`).

---

**NOTE:** Use lowercase letters only. The username and password are both case-sensitive.

5. (Optional) By default, the console times out and terminates automatically after 10 minutes of idle time. To change this timeout interval, use the following command:

   `set console timeout number`
where *number* is the length of idle time in minutes before session termination. To prevent any automatic termination, specify a value of 0.

**Starting a Console Session Using Dialup**

Each NetScreen-5000 Series system provides a modem port that allows you to establish a remote console session using a dialup connection through a 9600 bps modem. Dialing into the modem establishes a dialup console connection.

**NOTE:** The Terminal type for dialup sessions must be vt100. For example, in Hilgreave HyperTerminal (a standard terminal application), select the *File* menu, select *Properties*, select the *Settings* tab, and then under the *Emulation* dropdown menu, select VT100.

**Establishing a GUI Management Session**

To access a NetScreen-5000 Series system with the WebUI management application:

1. Connect your computer (or your LAN hub) to the MGT interface using a Category-5 Ethernet cable. (The MGT interface is on the management module, which always resides in slot 1.)

2. Launch your browser, enter the IP address of the MGT interface in the URL field, and then press **Enter**.

   For example, if you assigned the MGT interface an IP address of 10.100.2.183/16, then enter:

   `http://10.100.2.183`

   The ScreenOS WebUI software displays the login prompt.

3. Enter `netscreen` in both the Admin Name and Password fields, then click **Login**. (Use lowercase letters only. The Admin Name and Password fields are both case-sensitive.)

   The ScreenOS WebUI application window appears.

**Configuring the Chassis Alarm**

The NetScreen-5000 Series system allows you to configure the chassis alarm, an audible warning that sounds when a system failure or hazardous event occurs. To determine which failures and events trigger the chassis alarm:
1. Configure the audible alarms with the following command:

   ```
   set chassis audible-alarm string
   ```

   where `string` can be any of the following keywords:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Enables all chassis alarms.</td>
</tr>
<tr>
<td>battery</td>
<td>Sets the chassis alarm to sound when a battery fails.</td>
</tr>
<tr>
<td>fan-failed</td>
<td>Sets the chassis alarm to sound when a fan fails.</td>
</tr>
<tr>
<td>power-failed</td>
<td>Sets the chassis alarm to sound when a power supply fails.</td>
</tr>
<tr>
<td>temperature</td>
<td>Sets the chassis alarm to sound when the temperature goes outside of the acceptable range.</td>
</tr>
</tbody>
</table>

2. After configuring the alarm, it is advisable to view alarm environment information with the following command:

   ```
   get chassis
   ```

**Configuring Jumbo Frames**

The 5000-8G2 and 5000-2XGE SPMs support jumbo frames that are up to 9,830 bytes. To set jumbo frames, use the `set environment max-frame-size=9830` CLI command. You must reboot the system before this feature can take effect.
Configuring Aggregate Interfaces

The NetScreen-5000 Series system allows you to combine two or more physical ports on an SPM into a single virtual port. This virtual port is known as an aggregate interface. Only Secure Port Modules (SPMs) support this feature. Table 8 describes the aggregate interfaces supported on the various SPMs.

### Table 8: Aggregate Interface Support per SPM

<table>
<thead>
<tr>
<th>SPM Type</th>
<th>Maximum number of aggregate interfaces</th>
<th>Maximum number of ports per aggregate interface</th>
<th>Supported Aggregations</th>
</tr>
</thead>
<tbody>

<td>4</td>
<td>Any combination of ports 1 through 4, or any combination of ports 5 through 8. You cannot aggregate ports 1 through 4 with ports 5 through 8.</td>
</tr>
<tr>
<td>5000-2G24FE</td>
<td>6 (5 for FE ports and 1 for SFP ports)</td>
<td>8</td>
<td>Any combination of up to 8 FE ports per aggregate interface. You can also aggregate the two SFP ports together. You cannot aggregate FE ports and SFP ports together.</td>
</tr>
</tbody>
</table>

You assign the aggregate interface a name of the format `aggregate1` through `aggregateN`, where N is the total of the maximum number of aggregate interfaces supported by all of the SPMs in the chassis.

In the following example, you combine two SFP ports, each running at 1 Gbps, into an aggregate interface running at 2 Gbps. The aggregate interface consists of Ethernet ports 1 and 2 on a 5000-8G SPM (residing in slot 2).

To create the aggregate interface:

1. (Optional) To see what physical ports are available on your NetScreen-5000 Series system:
   
   get interface

2. To create an aggregate interface name:

   ```
   set interface string zone zonename
   ```

   where `string` is a legal aggregate interface name.

   For example, to create the aggregate interface name `aggregate1`:

   ```
   set interface aggregate1 zone zonename
   ```

3. To assign ports ethernet2/1 and ethernet2/2 to the `aggregate1` interface name:

   ```
   set interface aggregate1 ethernet2/1
   set interface aggregate1 ethernet2/2
   ```
set interface ethernet2/1 aggregate aggregate1
set interface ethernet2/2 aggregate aggregate1

4. (Optional) To see the updated port list and details about the new aggregate interface:

   get interface
   get interface aggregate1

   Notice that the listing contains aggregate1, an aggregate interface comprised of ethernet2/1 and ethernet2/2. This aggregate interface runs with a throughput rate of 2 Gbps. Use the following command to bind the aggregate interface, aggregate1, to the trust zone:

   set interface aggregate1 zone trust

NOTE: As with most other interfaces, you must assign the aggregate interface an IP address so that other nodes on the network can reach it.
Restarting the Device

You may need to restart the device in order to implement new features, such as when you change between route and transparent mode or when you add new license keys.

The following sections describe two methods of restarting the device:

- “Restarting the Device with the CLI Reset Command” on page 45
- “Restarting the Device with the WebUI” on page 45

**Restarting the Device with the CLI Reset Command**

To restart the device with the CLI reset command:

1. Establish a console session with the device as described in “Configuring the Device for Telnet and WebUI Sessions” on page 40.

   At a Windows workstation, the easiest way of opening a console connection is to choose Start > Run and enter `telnet ip_address`.

   The device prompts you for your login and password.

2. If you have not yet changed the default username and password, enter `netscreen` at both the login and password prompts. (Use lowercase letters only. The login and password fields are both case-sensitive.)

3. At the console prompt, enter:

   `reset`

   The device prompts you to confirm the reset:

   `System reset, are you sure? y/[n]`

4. Enter Y.

   The device restarts.

**Restarting the Device with the WebUI**

To restart the device with the WebUI:

1. Launch your browser and enter the IP address for the management interface (the default IP address is 192.168.1.1), then press Enter.

   The WebUI application displays the login prompt.

2. If you have not yet changed the default username and password, enter `netscreen` at both the login and password prompts. (Use lowercase letters only. The login and password fields are both case-sensitive.)

3. In the WebUI, choose:

   Configuration > Update > ScreenOS/Keys
4. Click **Reset**.

An alert box prompts you to confirm that you want to reset the device.

5. Click **OK**.

The device resets. Also, an alert box prompts you to leave your browser open for a few minutes and then log back into the device.

### Using CLI Commands to Reset the Device

If you lose the admin password, then you can use the following procedure to reset the NetScreen-5000 Series system to its default settings. This procedure destroys any existing configurations, but restores access to the device. To perform this operation, you need to make a console connection, as described in “Establishing a Terminal Emulator Connection” on page 35.

1. At the login prompt, enter the serial number of the NetScreen-5000 Series system.

2. At the password prompt, enter the serial number again. The following message appears:

   !!! Lost Password Reset !!! You have initiated a command to reset the device to factory defaults, clearing all current configuration, keys and settings. Would you like to continue? y/[n]

3. Press **y**.

   The following message appears:

   !! Reconfirm Lost Password Reset !! If you continue, the entire configuration of the device will be erased. In addition, a permanent counter will be incremented to signify that this device has been reset. This is your last chance to cancel this command. If you proceed, the device will return to factory default configuration, which is: System IP: 192.168.1.1; username: netscreen; password: netscreen. Would you like to continue? y/[n]

4. Press **y** to reset the device.

   You can now log in using **netscreen** as the default admin name and password.

---

**WARNING:** Resetting the NetScreen-5000 Series system deletes all existing configuration settings, and the firewall and VPN services is rendered inoperative.

---

**NOTE:** After you successfully reset and reconfigure the NetScreen-5000 Series, you should back up the new configuration setting. As a precaution against lost passwords, you should back up a new configuration that contains the ScreenOS default password. This will ensure a quick recovery of a lost configuration. You should change the password on the system as soon as possible. For detailed information about configuration backups, refer to the Concepts & Examples ScreenOS Reference Guide.

By default, the device recovery feature is enabled. You can disable it with the following CLI command: **unset admin device-reset**.
Chapter 4
Servicing the Device

This chapter details service and maintenance of various components in your NetScreen-5000 Series system. Topics in this chapter include:

- “Removing and Reseating Modules” on page 47
- “Replacing a DC Power Supply” on page 49
- “Replacing an AC Power Supply” on page 50
- “Replacing the Fan Module” on page 50
- “Connecting and Disconnecting Gigabit Ethernet Cables” on page 55
- “Removing and Installing SFP and XFP Transceivers” on page 57

Removing and Reseating Modules

Although NetScreen-5000 Series modules are preinstalled before shipping, you may find it necessary to remove or reseat modules to suit the special security needs of your network.

WARNING: Always be sure the chassis power switch is off before you remove or install a Secure Port Module (SPM) or management module.

To remove a module from a NetScreen-5000 Series system:

1. Release the module from the chassis by loosening the screws.
2. Rotate the ejector/injector levers to disengage the module from the backplane as shown in Figure 19.
3. Gently slide the module card out of the chassis.

To install a module in a NetScreen-5000 Series system:

1. Be sure the module is right-side-up and the ejector/injector levers are extended.

2. Slide the module into the appropriate slot of the chassis, until it is seated in the backplane.

3. To secure the module in the chassis, close the ejector/injector levers by pushing on them toward the center of the module as shown in Figure 20.
Replacing a DC Power Supply

**WARNING:** Before replacing a power supply, you must shut off current to the DC feed wires that lead to the power supply. Also, be sure that the power switch is in the off position (right side pressed in).

To replace a DC power supply:

1. Turn off the power supply.
2. Loosen the retaining screws on the terminal block.
3. Remove the feed wires.
4. Turn the thumbscrew counterclockwise to release the power supply.
5. Lift and grip the lever, and then gently pull the power supply straight out.
6. Insert the new power supply into the bay.
7. Secure the power supply in place by tightening the thumbscrew clockwise.
8. Reconnect the wires as explained in “Installing and Wiring a DC Power Supply” on page 28.
Replacing an AC Power Supply

To replace an AC power supply:
1. Turn off the power supply.
2. Lift the AC power cord retainer clip.
3. Unplug the cord from the power supply.
4. Turn the thumbscrew counterclockwise to release the power supply.
5. Lift and grip the lever, and then gently pull the power supply straight out.
6. Insert the new power supply into the bay.
7. Secure the power supply in place by tightening the thumbscrew clockwise.
8. Lift the retainer clip, and then plug the power cord into the power supply.
9. Press the retainer clip over the cord, securing it in place.

Replacing the Fan Module

The front panel of each device includes an air vent for cooling purposes. The NetScreen-5000 Series fan modules differ according to the device model:

- The NetScreen-5200 fan module has three fans.
- The NetScreen-5400 fan module has two fans.

When a fan or fan module fails, the Fan LED glows red, and the system generates an event alarm and a SNMP trap. Although a NetScreen-5000 Series system can operate with a fan out of service, it is advisable to replace the fan module as soon as possible.

When you remove the fan module, you must reinstall it (or replace it) within two minutes, or system failure can occur.

If the temperature alarm continues to display, we recommend inspecting the fan filter. To remove a filter cover and replace a filter, use the procedures described in this section.

WARNING: If the device becomes too hot, then the system shuts down automatically.

NOTE: During the one-year warranty period, you can obtain a replacement fan module by contacting Juniper Networks Technical support. After the warranty period, contact the Juniper Networks Sales department to renew your support contract.

Depending on the working environment where the device is located, we recommend changing the fan filter every six months. The fan filter SKU number is NS-5200-FLTR or NS-5400-FLTR.
**NetScreen-5200 Fan Module**

Figure 21 shows the location of the fan lever on the NetScreen-5200.

**Figure 21: NetScreen-5200 Fan Module**

To remove the fan module on a NetScreen-5200, perform the following steps:

1. Pull the fan lever until it is fully extended.
2. Grip the sides, then gently slide the assembly straight out as shown in Figure 22.

3. Insert the new fan module in the fan bay, then push it straight in.
4. Secure the fan module in place by pushing the fan lever flat against the front panel.

**WARNING:** Do not remove the fan module while the fans are still spinning.

**Figure 22: Removing a NetScreen-5200 Fan Module**
NetScreen-5200 Fan-Tray Filter

Before you replace the fan-tray filter, make sure you have the following tools:

- Flashlight or other light source
- 18-inch wooden ruler

To replace the fan-tray filter:

1. Remove the fan tray (see “NetScreen-5200 Fan Module” on page 51).
2. Pull the front edge of the filter from the Velcro backing.
3. Insert a wooden ruler between the filter and the chassis wall as shown in Figure 23.

![Figure 23: Separating a NetScreen-5200 Fan-Tray Filter](image)

4. Push the wooden ruler toward the back of the chassis, gently lifting the filter as you proceed.
5. Once the filter is separated from the Velcro backing, use your fingers to pull the filter out of the fan-tray slot as shown in Figure 24.

![Figure 24: Removing a NetScreen-5200 Fan-Tray Filter](image)

6. Carefully insert a new filter into the chassis. Use the wooden ruler as an aid to guide the back edge of the filter to reach the end of the Velcro wall.
7. Once the filter is fully inserted, push the wooden ruler against the filters surface several times to insure that the filter is secure against the chassis wall.

**NOTE:** Make sure that the filter is secure against the Velcro wall; otherwise the filter will tear when you reinstall the fan.

8. Insert the fan tray into the chassis.

9. Lock the fan lever.

**NetScreen-5400 Fan Module**

Figure 25 shows the NetScreen-5400 fan module.

**Figure 25: NetScreen-5400 Fan Module**

To replace the fan module on a NetScreen-5400:

1. Loosen the top and bottom thumbscrews with a phillips screwdriver, turning them counterclockwise.

2. Grip the screws, and then gently slide the fan module out as shown in Figure 26.

**WARNING:** Do not remove the fan module while the fans are still spinning.
3. Align the new fan module in the fan bay, and then push it straight in as shown in Figure 27.

Figure 27: Inserting a NetScreen-5400 Fan Module

4. Secure the fan module in place by tightening the thumbscrews clockwise.

NetScreen-5400 Fan-Tray Filter

To replace the fan-tray filter:

1. Remove the fan tray (see “NetScreen-5400 Fan Module” on page 53).

2. Lay the fan-tray on a table filter-side up as shown in Figure 28.
Connecting and Disconnecting Gigabit Ethernet Cables

To connect a Gigabit Ethernet cable to a Small Form factor Pluggable (SFP) connector transceiver port:

1. Hold the cable clip firmly but gently between your thumb and forefinger, with your thumb on top of the clip and your finger under the clip. (Do not depress the clip ejector on top of the clip.)

2. Slide the clip into the transceiver port until it clicks into place. Because the fit is close, you may have to apply some force to seat the clip. Apply force evenly and gently to avoid clip breakage.

To remove the cable from the transceiver port:

1. Make sure the black transceiver ejector under the port is not pressed in; otherwise, when you attempt to remove the cable, the transceiver might come out with the cable still attached.

3. Pull the filter from the Velcro backing as shown in Figure 29.

4. Replace the filter.

5. Align the new fan module in the fan bay, and then push it straight in.

6. Secure the fan module in place by tightening the thumbscrews clockwise.

Figure 28: NetScreen-5400 Fan-tray Filter

Figure 29: Removing the NetScreen-5400 Fan-tray Filter
2. Hold the cable clip firmly but gently between your thumb and forefinger, with your thumb on top of the clip and your finger under the clip.

3. Use your thumb to gently press the clip ejector on top of the clip, first down and then forward. This action loosens the clip from the transceiver port.

4. Pull the clip from the transceiver port.
Removing and Installing SFP and XFP Transceivers

To remove an SFP or XFP transceiver from a module:

1. Push in the black ejector (located on the underside of the transceiver) until it locks into place, disengaging the transceiver.

2. Grasp the transceiver at both sides, and then pull the transceiver toward you to remove it from the module.

To install an SFP or XFP transceiver into a module:

NOTE: Juniper strongly recommends the use of Juniper transceivers. Juniper cannot guarantee correct operation if non-Juniper transceivers are used. The transceiver type can be different in each port, as long as a supported part number is used.

1. Grasp the transceiver with the label facing up, and then insert it into the transceiver slot until seated.

2. Check to see if the black transceiver ejector extends fully out to the front of the ejector slot, flush with the port portion of the transceiver.
Appendix A
Specifications

This appendix provides general system specifications for the NetScreen-5000 Series security devices.

- “Physical” on page 59
- “Electrical” on page 60
- “Environmental” on page 60
- “Certifications” on page 61
- “Connectors” on page 61

Physical

Table 9 lists the physical specifications for NetScreen-5000 Series devices.

<table>
<thead>
<tr>
<th>Specification</th>
<th>NetScreen-5200</th>
<th>NetScreen-5400</th>
</tr>
</thead>
<tbody>

| Fuse Rating        | AC: 3.15 Amps/240 Volts  
|                    | DC: 6 Amps / 250 Volts (NetScreen-5200) and 12 Amps / 250 Volts (NetScreen-5400) |

**WARNING:** Certain ports on the device are designed for use as intrabuilding (within-the-building) interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE, Issue 4) and require isolation from the exposed outside plant (OSP) cabling. To comply with NEBS requirements and protect against lightning surges and commercial power disturbances, the intrabuilding ports must not be metallically connected to interfaces that connect to the OSP or its wiring. The intrabuilding ports on the device are suitable for connection to intrabuilding or unexposed wiring or cabling only. The addition of primary protectors is not sufficient protection for connecting these interfaces metallically to OSP wiring.

**CAUTION:** To comply with intrabuilding lightning and surge requirements, intrabuilding wiring must be shielded, and the shield for the wiring must be grounded at both ends.

Environmental

Table 11 lists the environmental specifications for the NetScreen-5000 Series device.

1. NEBS certification is currently not available on the 5000-MGT3 management module.

Connectors

The RJ-45 twisted-pair ports are compatible with the IEEE 802.3 Type 10/100 Base-T standard.

The SFP transceivers used in NetScreen-5000 Series modules are Shortwave or SX type, so they are capable of distances up to 550 meters. (This varies by manufacturer.) The limit is 850 meters for the optic LC-type connector. The SFP transceivers are compatible with the IEEE 802.3z Gigabit Ethernet standard.

Table 13 lists the 1-Gigabit media types and distances for the different types of connectors used with the NetScreen-5000 Series systems.

**Module LED Descriptions**

This section provides descriptions of the LEDs on NetScreen-5000 Series modules. Two types of LEDs exist on the modules:

- **Status LEDs.** These LEDs reflect certain conditions that exist on the system at large and do not explicitly refer to a given port.

- **Port LEDs.** These LEDs reflect basic conditions (for example, a link connection status) that exist for a specific port.
**Status LED States**

This section describes Status LED states on all modules.

**Interpreting Status LEDs for the Management Modules**

The Status LEDs indicate whether the management module is operating properly. Table 17 describes the status possibilities for each.

### Table 17: Management Module Status LEDs

**Interpreting Status LEDs for the Secure Port Module**

The Status LEDs indicate whether the Secure Port Module is operating properly. Table 18 describes the status possibilities for each.
Interpreting Ethernet Port Status LEDs for All Modules

Table 18: Secure Port Module Status LEDs

<table>
<thead>
<tr>
<th>LED</th>
<th>Color</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>POWER</td>
<td>Green</td>
<td>The system is receiving power.</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>The system is not receiving power.</td>
</tr>
<tr>
<td></td>
<td>Amber</td>
<td>The system has initially received power.</td>
</tr>
<tr>
<td>STATUS</td>
<td>Blinking green</td>
<td>The system is up and operational and that the power source is working properly.</td>
</tr>
<tr>
<td></td>
<td>Green</td>
<td>The system has a problem.</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>The Secure Port Module is not operational.</td>
</tr>
</tbody>
</table>

The port Status LEDs indicate whether any of the ports on the modules are operating properly. Table 19 describes the status possibilities for each.

Table 19: Port Module Status LEDs

<table>
<thead>
<tr>

<tbody>
<tr>
<td>LINK</td>
<td>Green</td>
<td>A successful link has been established.</td>
</tr>
<tr>
<td></td>
<td>Blinking green</td>
<td>The port is attempting to establish a link.</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>The port has not established a link with another device.</td>
</tr>
<tr>
<td>TX/RX</td>
<td>Green</td>
<td>The port is successfully passing packets back and forth to a destination device.</td>
</tr>
<tr>
<td></td>
<td>Blinking green</td>
<td>The port is attempting to pass packets back and forth to a destination device.</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>The port does not have a device connected to it.</td>
</tr>
</tbody>
</table>

Power Supply LEDs

The following tables describe LED behaviors on the 5000-M and 5000-M2 for different combinations of functioning power supplies.

Interpreting Power Supply LED Status for the NetScreen-5200

Table 20 details the LED behaviors on the 5000-M and 5000-M2 for different combinations of functioning power supplies on the NetScreen-5200.
Table 20: LED Behaviors As Affected by Power Supplies (NetScreen-5000-M and 5000-M2)

<table>
<thead>
<tr>
<th>Power Supply 1 Present</th>
<th>Power Supply 2 Present</th>

</tbody>
</table>

Interpreting Power Supply LED Status for the NetScreen-5400

The status of the Power and Alarm LEDs depends upon whether the NetScreen-5400 contains a single Secure Port Module (SPM) or multiple SPMs.

Single SPM Installed

Table 21 describes the LED behaviors for different combinations of functioning power supplies when there is only one SPM installed.

Table 21: LED Behaviors As Affected by Power Supplies (NetScreen-5400)
