Juniper Networks Rapid Deployment

Getting Started

This guide helps you connect and configure your security device using Rapid Deployment (RD). RD automatically configures your device for management by Juniper Networks NetScreen-Security Manager, the integrated management system for all Juniper Networks security devices.

CONNECTING THE DEVICE

Use the instructions below to connect the security device and prepare to configure it to protect your network. Use the LEDs on the front panel of the device to help you determine device status.

Step 1
On a workstation, save the configlet. If you do not have a configlet, contact your NetScreen-Security Manager administrator.

Step 2
Connect an Ethernet cable from the Untrust port of the device to the external router, cable modem, or DSL modem.

Step 3
Connect the workstation:
• If the workstation is in a LAN, connect an Ethernet cable from a Trust port to the internal switch or hub.

• If the workstation is a single workstation, connect an Ethernet cable from a Trust port to the Ethernet port on the workstation.

Step 4
Connect the power cable between the security device and a power source. We recommend using a surge protector.

a. Verify that the Power LED glows green (this indicates that the device is receiving power).

b. After the device starts (about 30 seconds), verify that the Status LED blinks green (indicates the device is operating normally).

c. Verify that the Link LEDs glow for the connected interfaces (indicates the device has network connectivity).

Step 5
Configure the workstation to access the security device:

a. Ensure the workstation is properly connected to your LAN and that your internal network does not already use a DHCP server.

b. Configure your workstation to automatically receive an IP address from the security device.

• If necessary, restart your workstation. Some operating systems must be restarted for new settings to take effect.
CONFIGURING THE DEVICE

Use the instructions below and follow the Rapid Deployment (RD) Wizard to configure the device for management. The Wizard helps you install the configlet and enables the NetScreen-Security Manager administrator to begin managing the device remotely.

For details on other configuration methods and local management features, see the User Guide or Hardware Installation and Configuration Guide for your security device.

Step 1
Launch a Web browser. In the Web browser URL address field, enter http://192.168.1.1. The RD Wizard appears.

Step 2
Select Load Configlet from and browse to the location of the saved configlet (.cfg) file. Click Next to continue.

The RD Wizard opens the configlet, verifies its integrity, and then decrypts the configlet information. Using this information, the Wizard prepares the device for management.

During this preparation process, the Wizard prompts you for any required information. Some or all of the required information might have already been entered by the NetScreen-Security Manager administrator.

Because the Wizard prompts you only for missing information, you might not need to complete all of the following steps.

Step 3
If prompted, enter the configlet password provided by your NetScreen-Security Manager administrator.

Step 4
If prompted for PPPoE information, enter the username and password for your PPPoE account.

Step 5
If prompted for PPPoA information, enter the VPI/VCI pair, multiplexing and operating mode, and username/password for your PPPoA account.

Step 6
If prompted for static IP information, enter the following:
- The IP address and netmask of the interface connected to the external router, cable modem, or DSL modem.
• The gateway address (the IP address of the router port connected to the device).

Step 7
If the NetScreen-Security Manager administrator did not specify any ISP information, you must select the ISP environment in which you deployed your device:

When using a configlet with a NetScreen-5GT ADSL device, the following screen appears instead:

• If your device uses a PPPoE connection to the Internet, select Using DSL modem (Dynamic IP via PPPoE). This option enables your device to act as a PPPoE client that receives an IP address for the Untrust interface from an ISP. Enter the following:
  – The username for your PPPoE account
  – The password for your PPPoE account
• If your device uses a PPPoA connection to the Internet, select Using Dynamic IP via PPPoA. This option enables your device to act as a PPPoA client that receives an IP address for the Untrust interface from an ISP. Enter:
  – The VPI/VCI pair
  – The multiplexing, protocol, and operating modes
  – The username for your PPPoA account
  – The password for your PPPoA account
• If your device uses a static IP address, select Using ISP-supplied settings (Static IP). This option enables your device to use a unique and fixed IP address for the Untrust interface. Enter the following:
  – The IP address and netmask of the interface connected to the external router, cable modem, or DSL modem
  – The gateway address (the IP address of the router port connected to the device)

Step 8
The device processes the information; when completed, the device contacts the management system and establishes a secure connection. The following message appears:

If the device needs to acquire a dynamic IP address from your ISP, the following message also appears:

When the device connects, a confirmation screen appears indicating that you have successfully installed the configlet on the device.

Step 9
Click Finish to exit the Wizard and close the browser.
MANAGING THE DEVICE

Now that your device is connected to NetScreen-Security Manager, the NetScreen-Security Manager administrator can complete the device configuration and create a Security Policy to protect your network.

For devices managed by NetScreen-Security Manager, the NetScreen-Security Manager administrator handles all device configuration and device maintenance. For details on using NetScreen-Security Manager to configure Security Policies, VPNs, attack protection, or other features, see the NetScreen-Security Manager Administrator’s Guide.

However, you can also manage the device locally for troubleshooting purposes, using the WebUI or the Command Line Interface (CLI):

- Using the WebUI, you can manage basic device features and view device configuration. For details, see the NetScreen Concepts & Examples ScreenOS Reference Guide.
- Using CLI, you can manage all features of your device. For details, see the NetScreen CLI Reference Guide: Command Descriptions.

TROUBLESHOOTING

During the configlet installation process, errors can occur if the security device is not properly connected to the network, or if the device is not running a factory default configuration.

The following sections provide details on resolving configlet installation issues.

Untrust Interface Failure Warning

This warning appears when the DCHP, PPPoE, or PPPoA service cannot assign an IP address to the device Untrust interface. The device cannot connect to NetScreen-Security Manager without an untrust IP address.

To resolve the issue, check the following:

- Verify that the untrust interface of the device is connected to the external network.
- If you are using DHCP to assign an address to the untrust interface, verify that the DHCP server is functioning properly.
- If you are using PPPoE or PPPoA to assign an address to the untrust interface, verify that PPPoE or PPPoA is supported on your network.

Factory Default Warning

This error appears when the device is not running a factory default configuration. RD is designed to configure non-deployed devices and enable them to connect to NetScreen-Security Manager. If your device already contains a device configuration, you must reset the device before you can use a RD configlet. For details on resetting the device, see the User Guide or Hardware Installation and Configuration Guide that shipped with your device.
