Objectives

The *Junos Pulse Administration Guide* describes Junos Pulse and includes procedures for network administrators who are responsible for setting up and maintaining network access using Junos Pulse client software.

Audience

The *Junos Pulse Administration Guide* is for network administrators who are responsible for setting up and maintaining network access using Junos Pulse client software. This guide describes the procedures for configuring Junos Pulse as the access client.

Document Conventions

Obtaining Documentation

To obtain the most current version of all Juniper Networks technical documentation, see the products documentation page on the Juniper Networks Web site at http://www.juniper.net/.

To order a documentation CD, which contains this guide, contact your sales representative.

Copies of the Management Information Bases (MIBs) available in a software release are included on the documentation CDs and at http://www.juniper.net/.

Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can send your comments to techpubs-comments@juniper.net, or fill out the documentation feedback form at https://www.juniper.net/cgi-bin/docbugreport/. If you are using e-mail, be sure to include the following information with your comments:

- Document or topic name
- URL or page number
- Software release version (if applicable)

Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- Product warranties—For product warranty information, visit http://www.juniper.net/support/warranty/.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: http://www.juniper.net/customers/support/
- Search for known bugs: http://www2.juniper.net/kb/
- Find product documentation: [http://www.juniper.net/techpubs/](http://www.juniper.net/techpubs/)
- Find solutions and answer questions using our Knowledge Base: [http://kb.juniper.net/](http://kb.juniper.net/)
- Download the latest versions of software and review release notes: [http://www.juniper.net/customers/csc/software/](http://www.juniper.net/customers/csc/software/)
- Search technical bulletins for relevant hardware and software notifications: [https://www.juniper.net/alerts/](https://www.juniper.net/alerts/)
- Join and participate in the Juniper Networks Community Forum: [http://www.juniper.net/company/communities/](http://www.juniper.net/company/communities/)
- Open a case online in the CSC Case Management tool: [http://www.juniper.net/cm/](http://www.juniper.net/cm/)

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: [https://tools.juniper.net/SerialNumberEntitlementSearch/](https://tools.juniper.net/SerialNumberEntitlementSearch/)

### Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at [http://www.juniper.net/cm/](http://www.juniper.net/cm/).
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see [http://www.juniper.net/support/requesting-support.html](http://www.juniper.net/support/requesting-support.html).
PART 1

Junos Pulse

This part introduces Junos Pulse, describes Junos Pulse features, and presents configuration concepts.

- Junos Pulse Overview on page 3
- Configuring Junos Pulse Access Control Service on page 19
- Configuring Junos Pulse Secure Access Service on page 57
- Configuring Junos Pulse on SRX Series Gateways on page 105
- Configuring Junos Pulse Application Acceleration Service on page 109
- Session Migration on page 119
- Deploying Junos Pulse Client Software on page 127
CHAPTER 1

Junos Pulse Overview

- Introducing Junos Pulse on page 3
- Supported Network Gateways and Pulse Client Installation Requirements on page 13
- Accessing Junos Pulse Client Error Messages on Windows Endpoints on page 13
- Accessing Junos Pulse Client Error Messages on Mac OS X Endpoints on page 15
- Migrating From Odyssey Access Client to Junos Pulse on page 17
- Migrating From Network Connect to Junos Pulse on page 18

Introducing Junos Pulse

Junos® Pulse is an extensible multi service network client that supports integrated connectivity, location-aware network access, application acceleration, security, and selected third-party services. Junos Pulse simplifies the user experience by letting the network administrator configure, deploy, and control the Pulse client software and the Pulse connection configurations that reside on the endpoint.

NOTE: For information about Junos Pulse on mobile devices, see “Junos Pulse for Mobile Devices Overview” on page 157.

Junos Pulse comprises client and server software. The client enables secure authenticated network connections to protected resources and services over local and wide area networks. The Junos Pulse client software can connect with the Junos Pulse Secure Access Service to provide remote access to enterprise and service provider networks. Pulse can provide application acceleration features when implemented with Junos Pulse Application Acceleration Service. Pulse also delivers secure, identity-enabled NAC for LAN-based network and application access when deployed with Junos Pulse Access Control Service. Pulse integrates third-party endpoint security applications such as anti spyware, anti malware, and patch management applications. Pulse also integrates with Junos Pulse Collaboration Suite for online meeting services.

Users of mobile devices (smartphones) can install the Pulse mobile device app from the respective app stores for secure connectivity to Junos Pulse Secure Access Service. Mobile device users can also enable an optional security component, the Junos Pulse Mobile Security Suite.
The Junos Pulse Client for Windows

The Junos Pulse client interface (see Figure 1 on page 4) displays the deployed Pulse services in the left pane and details about the selected item in the right pane. The Connections item lists the Pulse connections. Each connection is a set of properties that enables network access through a specific Pulse server. The Security item is visible only when optional security options are deployed, such as the Juniper Networks Enhanced Endpoint Security (EES) application. If a Pulse server is licensed to provide EES, you can enable EES and deploy it as part of the Host Checker configuration. The Acceleration item is active when the Pulse client has an adjacency with Pulse Application Acceleration Service.

The Pulse client interface also supports select third-party applications. Figure 1 on page 4 shows one such application, iPass Networks, integrated into the Pulse client interface.

Figure 1: Junos Pulse Client Interface

The Pulse Client for Mac OS X

Pulse 3.0 and higher supports Apple computers running Mac OS X. You deploy Pulse to Mac endpoints the same way you deploy the Windows client. Figure 2 on page 5 shows the Pulse for Mac client interface.
Figure 2: Junos Pulse for Mac Client Interface

Pulse for Mac endpoints supports the following:

- Connections to Junos Pulse Access Control Service
- Connections to Junos Pulse Secure Access Service
  
  Pulse clients connect to the Pulse Secure Access Service in SSL fallback mode.
- Host Checker
  
  Host Checker for Mac OS X supports the following rules and remediation actions:
  
  - Port
  - Process
  - File
  - Custom IMC
  - Enable Custom Instructions
  - Kill Processes
  - Delete Files
  - Send reason strings
NOTE: Pulse for the Mac does not support soft token authentication.

Location Awareness

The location awareness feature enables you to define connections that are activated automatically based on the location of the endpoint. Pulse determines the location of the endpoint by evaluating rules that you define. For example, you can define rules to enable Junos Pulse to automatically establish a secure tunnel to the corporate network through Junos Pulse Secure Access Service when the user is at home, and to establish a Junos Pulse Access Control Service connection when the user is in the office and connected to the corporate network over the LAN. Location awareness rules are based on the client's IP address and network interface information.

Session Migration

If you configure your access environment to support the Junos Pulse session migration feature, users can log in once through a Pulse server on the network, and then securely access additional Pulse servers without needing reauthentication. For example, a user can connect from home through Junos Pulse Secure Access Service, and then arrive at work and connect through Junos Pulse Access Control Service without having to log in again. Session migration also enables users to access different resources within the network without repeatedly providing credentials. IF-MAP Federation is required to enable session migration for users.

Centralized Control

Centralized configuration management is a key feature of Junos Pulse. To achieve centralized management, you can use Junos Pulse Access Control Service or Junos Pulse Secure Access Service to configure all of the connections that clients need, and then push those configurations to the other servers using the Push Configuration feature. In a network that includes more than one Junos Pulse server, you can bind clients to a particular server. The client can automatically pick up new connections from other Pulse servers but only the binding server can update the client's basic configuration settings.

You can define Junos Pulse connections on the server and pass them to the client or users can add connections directly on the client. (You can disable the users' ability to add connections.) A connection includes all of the information that a Pulse client needs to connect to a specific Pulse server. Connections can be installed on the endpoint when Junos Pulse is installed and they can be added or updated later. Options within each Junos Pulse connection allow an administrator to define the level of control over the clients. A connection has the following options:

- By default, a network connection through Junos Pulse allows users to save their logon credentials. The Junos Pulse admin interface lets you disable this feature so that users must always provide credentials.
- You can allow or deny users the ability to manually configure new network connections to their existing Junos Pulse connection set.
• You can allow dynamic connections to provide easy distribution of connection settings. A dynamic connection is automatically downloaded to an existing Pulse client when the user successfully logs into the Pulse server’s Web portal and launches Pulse from there. It is also installed as part of a Web install of Junos Pulse. Dynamic connections are created as manual rather than automatic connections, which means that they are run only when the user initiates the connection or the user browses to a Pulse Server and launches Pulse from server’s Web interface.

• You can allow or deny a client’s ability to trust unknown certificates.

• You can choose to control the client’s wireless connection environment. Junos Pulse relies on the endpoint’s native wireless supplicant, but you can have Pulse disconnect all wireless connections when the client is connected to a wired network through a Pulse connection. You can also specify the permitted wireless networks (scan list) that are available when the Pulse client is connected through a wireless interface.

**Security Certificates**

Users cannot add CA servers or manage the server list. Pulse handles certificates similar to the way a browser handles certificates. If the Pulse dynamic certificate trust option is enabled for a connection, the user can accept or reject the certificate that is presented if it is one that is not from a CA that is defined in the endpoint’s certificate store.

An 802.1X connection enables an added layer of certificate verification. When you define an 802.1X connection on the access device, you can specify server certificate distinguished names for each CA.
Compliance and Remediation

Pulse supports the Host Checker application to assess endpoint health and update critical software. Host Checker is a client side agent that is based on Trusted Network Connect standards. You configure rules in Host Checker policies for Junos Pulse Secure Access Service and Junos Pulse Access Control Service to specify the minimum criteria for the security compliance of endpoints that are allowed to enter the network. Endpoints that fail can be connected through a role that provides limited access, a remediation role.

Host Checker can be deployed from a Pulse server to Pulse clients on Windows and Mac OS X endpoints and it will be downloaded and run when a browser is used on a Windows or Mac OS X endpoint to connect to the Pulse server Web portal.

Host checker for mobile clients (iOS, Android, and Windows Mobile) is included as part of the app and it runs if Host Checker policies are configured and enabled on the server. Host Checker is not supported in the use case where the user employs a browser on the mobile device to connect to the Pulse server Web portal.

For Mac and OS X clients, you can use Host Checker to perform the following:

- Malware protection through Enhanced Endpoint Security (EES)

  EES ensures that malware, spyware, viruses, or worms are not present on endpoints, and you can restrict or quarantine these endpoints depending on your Host Checker policy configuration. EES is an optional licensed feature of Pulse Secure Access Service and Junos Pulse Access Control Service.

- Virus signature monitoring

  You can configure Host Checker to monitor and verify that the virus signatures, operating systems, software versions, and patches installed on client computers are up to date. You can configure automatic remediation for those endpoints that do not meet the specified criteria.

- Patch Management Info Monitoring and Patch Deployment

  You can configure Host Checker policies that check for Windows endpoints' operating system service pack, software version, or desktop application patch version compliance. server and Junos Pulse Access Control Service can send remediation instructions (such as a message describing what patches or software are non-compliant, and a link to where the endpoint can obtain the patch).

- Patch Remediation Options

  Pulse and Host Checker support endpoint remediation through Microsoft System Management Server or Microsoft System Center Configuration Manager (SMS/SCCM) or the Shavlik patch deployment engine. With SMS/SCCM, Pulse triggers a pre-installed SMS/SCCM client to get patches from a pre-configured SMS/SCCM server. Shavlik uses a patch deployment engine that Pulse downloads to any endpoint which needs remediation. Shavlik provides patches directly from Microsoft and other vendors' Web sites. (Internet connectivity is needed for Shavlik remediation.) Shavlik patch
management is an optional feature. A separate license is required for Shavlik patch monitoring and deployment.

- Endpoint configuration

You can configure custom rules to allow Host Checker to check for third party applications, files, process, ports, registry keys, and custom DLLs.

Pulse mobile clients support a set of Host Checker functions that vary from one OS to the next. For complete information on Host Checker for mobile clients, see “Implementing Host Checker Policies for Pulse for iOS Devices” on page 170, “Implementing Host Checker Policies for Pulse for Android Devices” on page 181, and “Junos Pulse for Windows Mobile” on page 195.

Two-factor Authentication

Pulse supports RSA SecurID authentication through soft token, hard token, and smart card authenticators. The SecurID software (RSA client 4.1 and later) must already be installed on the client machine.

NOTE: Pulse for the Mac does not support soft token authentication.

NOTE: For a complete list of features supported by Junos Pulse, see “Feature Comparison: Odyssey Access Client and Junos Pulse” on page 147 and “Feature Comparison: Network Connect and Junos Pulse” on page 151.

Junos Pulse Collaboration Suite Integration

Junos Pulse Collaboration Suite is accessible through the Pulse interface on Windows, Mac OS X, Android, and iOS. (Android clients must be R4.0 or later. iOS clients must be R3.2 or later.) Junos Pulse Collaboration Suite enables users to schedule and attend secure online meetings. In meetings, users can share their desktops and applications with one another over a secure connection. Meeting attendees can collaborate by enabling remote-control of their desktops and through text chatting.

Bound and Unbound Clients

Another feature of Pulse configuration management is the ability to bind Pulse clients to a single Pulse server. The binding server is the one that provides the initial Pulse configuration. Binding Junos Pulse clients to a particular server ensures that the client does not receive different configurations when accessing other Pulse servers. “Adding a Pulse Configuration to a New Pulse installation” on page 130 explains in more detail how the binding process works.

The following describes the behaviors of bound and unbound Junos Pulse clients.

- **Bound client**—A bound client is managed by a particular Pulse server. The Pulse administrator defines the Junos Pulse connections and software components that are installed on the endpoint. When the Pulse client connects to the Pulse server that is
managing it, the server automatically provisions configuration and software component updates. The administrator can permit the user to add and remove connections and to modify connections. The administrator can also allow dynamic connections, (connections added by Pulse servers when the user logs into the server using a browser). A dynamic connection enables a bound client to add connections from Pulse servers other than the one the client is bound to. Dynamic connections are created as manual rather than automatic connections, which means that they are run only when the user initiates the connection or the user browses to a Pulse Server and launches Pulse from server’s Web interface.

A bound endpoint receives connection set options and connections from its binding server, but it can have its Pulse client software upgraded from any Pulse server that has the automatic upgrade option enabled.

- **Unbound client**—An unbound client is managed by its user. The Junos Pulse client software is installed without any connections. The user must add connections manually. Dynamic connections can be added by visiting the Web portals of Pulse servers. An unbound client does not accept configuration updates from a Pulse server even if client configurations are defined on that server.

---

### Pulse Access Control Service and Pulse Secure Access Service Deployment Options

For Junos Pulse Access Control Service and Pulse Secure Access Service, you can deploy all of the connections required for Windows and Mac OS X clients to connect to any Pulse server.

---

**NOTE:** Pulse clients for mobile devices are distributed through the app stores. For information about Junos Pulse on mobile devices, see “Junos Pulse for Mobile Devices Overview” on page 157.

---

Junos Pulse Access Control Service and Pulse Secure Access Service support the following deployment options:

- **Web install**—Create all of the settings that a Windows or Mac OS X endpoint needs for connectivity and services, and install the software on endpoints that connect to the Pulse server’s Web portal. Pulse servers include a default client connection set and client component set. The default settings enable you to deploy Junos Pulse to users without creating new connection sets or component sets. The default settings for the client permit dynamic connections and install only the components required for the connection.

- **Default installer**—A default Junos Pulse installer package (in .msi format for Windows and .dmg for Mac OS X) is included in the Pulse server software. You can distribute this default installer to endpoints, run it, and then let users create their own connections or have users browse to the Pulse server and authenticate though the server’s Web portal to receive the initial configuration and bind the client to the server for future configuration updates. Users can automatically install connections to other Pulse servers (if the Pulse client’s configuration allows dynamic connections) by browsing to the user Web portal of a Pulse server where a dynamic connection has been made available. A dynamic connection is a predefined set of connection parameters that
enables a client to connect to the host server. If the user is able to log in to the Pulse server’s user Web portal, the connection parameters are downloaded and installed on the Junos Pulse client. Dynamic connections are created as manual rather than automatic connections, which means that they are run only when the user initiates the connection or the user browses to a Pulse Server and launches Pulse from the server’s Web interface.

- **Preconfigured installer**—Create the connections that an endpoint needs for connectivity and services, download the settings file (.jnprpreconfig), and download default Pulse installation program. For Windows endpoints you run the Pulse installation program by using an msiexec command with the settings file as an option. For OS X endpoints, you run the default installer and then import the .jnprpreconfig file using a separate command.

**NOTE:** Junos Pulse for mobile devices uses a different deployment model than Pulse for Windows and Pulse for Mac endpoints. For information about Pulse on mobile devices, see “Junos Pulse for Mobile Devices” on page 155.

### Application Acceleration Deployment Options

The Junos Pulse client accelerates traffic between the client system and a network’s Junos Pulse Application Acceleration Service. Pulse Application Acceleration Service and Pulse clients discover each other automatically and begin accelerating traffic without user intervention. Junos Pulse Application Acceleration Service supports the following deployment options:

- **The administrator can enable Pulse downloads and configure Pulse client configuration, and then users can download the Junos Pulse client from JWOS 6.1 or higher. When the license is present, a Junos Pulse selection appears in the task bar of the Web interface for the Pulse server.**

- **The Junos Pulse client can be downloaded and installed automatically when users access Junos Pulse Secure Access Service. On SA Series SSL VPN systems running software Release 7.0 or later, you can configure an App Acceleration connection for Application Acceleration Service and install it along with the Pulse client software. You can also deploy an App Acceleration connection from Junos Pulse Access Control Service. Although Pulse Access Control Service is for LAN access where WAN application acceleration is not used, Pulse Access Control Service can deploy any type of Pulse connection, which allows flexibility in how you deploy Pulse to users.**

**NOTE:** Junos Pulse for mobile devices does not support application acceleration. For information about Pulse on mobile devices, see “Junos Pulse for Mobile Devices” on page 155.
SRX Series Gateway Deployment Options

Endpoints can use Junos Pulse client software to connect to SRX Series gateways that are running Junos OS Release 10.2, and that have dynamic VPN access enabled and configured. The following describes deployment options for SRX Series gateway connections:

- You can create connections that use the connection type “Firewall” and deploy these connections from Pulse Secure Access Service or Junos Pulse Access Control Service.
- You can download the Junos Pulse installer from a Pulse server or the Juniper Networks Web and install it using local distribution methods such as SMS/SCCM. After installing Pulse, users create a connection to an SRX gateway.

NOTE: Junos Pulse for mobile devices can access Junos Pulse Secure Access Service only. For information about Pulse on mobile devices, see “Junos Pulse for Mobile Devices” on page 155.

Automatic Software Updates

After you deploy Junos Pulse client software to endpoints, software updates occur automatically. If you upgrade the Junos Pulse configuration on the server, updated software components are pushed to a client the next time it connects. (You can disable this automatic upgrade feature.)

NOTE: When you configure Junos Pulse to make 802.1x based connections, a reboot may be required on Windows XP endpoints when Pulse is upgraded.

Additional Pulse software components that are needed for new connections are pushed to the client as needed. Network connection properties are passed to the client at connect time based on the client’s role as defined on the Pulse server, after which those configuration properties reside on the client computer.

Accessing Junos Pulse Client Error Messages on Windows Endpoints

Junos Pulse client error and warning messages reside in message catalog files on the endpoint. Each message includes a short description that states the problem and a long description that provides more details and suggests actions to resolve the issue. Some of the message catalog files are part of a Junos Pulse component and are installed on an endpoint only if that component is installed on the endpoint.

All message catalog files are localized. The file name indicates the language. For example, MessageCatalogConnMgr_EN.txt is the English-language version of the file. The following file name conventions indicate the language:

- DE—German
- EN—English
- ES—Spanish
- FR—French
- JA—Japanese
- KO—Korean
- ZH—Chinese (Traditional)
- ZH-CN—Chinese (Simplified)

A Junos Pulse endpoint can have the following message catalog files:

- \Program Files\Common Files\Juniper Networks\8021xAccessMethod\MessageCatalog8021xAM_DE.txt
- MessageCatalog8021xAM_EN.txt
- MessageCatalog8021xAM_ES.txt
- MessageCatalog8021xAM_FR.txt
- MessageCatalog8021xAM_JA.txt
- MessageCatalog8021xAM_KO.txt
- MessageCatalog8021xAM_ZH-CN.txt
- MessageCatalog8021xAM_ZH.txt
- \Program Files\Common Files\Juniper Networks\Connection Manager\MessageCatalogConnMgr_DE.txt
- MessageCatalogConnMgr_EN.txt

Accessing Junos Pulse Client Error Messages on Mac OS X Endpoints on page 15

Accessing Junos Pulse Client Error Messages on Mac OS X Endpoints

Junos Pulse client error and warning messages reside in message catalog files on the OS X endpoint. Each message includes a short description that states the problem and a long description that provides more details and suggests actions to resolve the issue. Some of the message catalog files are part of a Junos Pulse component and are installed on an endpoint only if that component is installed on the endpoint.
All message catalog files are localized. The file name indicates the language. For example, MessageCatalogPulseUI_EN.txt is the English-language version of the file. The following file name conventions indicate the language:

- DE—German
- EN—English
- ES—Spanish
- FR—French
- JA—Japanese
- KO—Korean
- ZH—Chinese (Traditional)
- ZH-CN—Chinese (Simplified)

To view Pulse catalog files on Mac OS X endpoint, use Finder to display the package contents of the Pulse application. The Pulse endpoint can have the following message catalog files:

- Contents/Plugins/ConnectionManager
  MessageCatalogConnMgr_DE.txt
  MessageCatalogConnMgr_EN.txt
  MessageCatalogConnMgr_ES.txt
  MessageCatalogConnMgr_FR.txt
  MessageCatalogConnMgr_JA.txt
  MessageCatalogConnMgr_KO.txt
  MessageCatalogConnMgr_ZH-CN.txt
  MessageCatalogConnMgr_ZH.txt

  MessageCatalogIveAM_ZH-CN.txt
  MessageCatalogIveAM_ZH.txt

- Contents/Plugins/JUNS
Migrating From Odyssey Access Client to Junos Pulse

An endpoint can have Junos Pulse and Odyssey Access Client (OAC) installed at the same time. If the endpoint has an early version of OAC installed, the user must upgrade or uninstall it before installing Pulse. The Pulse installation program checks for OAC. If OAC is present and it is compatible, the Pulse installation proceeds. If the OAC is not
compatible, the Pulse installation displays a message advising the user to uninstall or upgrade OAC.

For detailed information about supported platforms and installation requirements, see the Junos Pulse Supported Platforms Guide, which is available at http://www.juniper.net/support/products/pulse.

**Wireless Connectivity, OAC, and Junos Pulse**

When OAC serves as the endpoint’s wireless supplicant, it handles login requests to the wireless network, passes login credentials to the authentication server, and maintains connectivity when the endpoint is roaming. You can continue to use OAC as the endpoint’s wireless supplicant, or you can uninstall OAC after installing Pulse and activate the native Windows wireless supplicant or other wireless connectivity software that might be installed on the endpoint. Junos Pulse does not include a wireless supplicant component. If the endpoint is running Junos Pulse but not running OAC, then the endpoint must be configured to use the Windows supplicant for wireless connectivity.

**Related Documentation**

- Feature Comparison: Odyssey Access Client and Junos Pulse on page 147
- Feature Comparison: Network Connect and Junos Pulse on page 151

**Migrating From Network Connect to Junos Pulse**

Junos Pulse and Network Connect (NC) can run at the same time on an endpoint.

**NOTE:** The Pulse installation program checks for NC. If the installation program finds NC Release 6.3 or later, the Pulse installation proceeds. If NC is not at least Release 6.3, the program displays a message telling the user to upgrade NC. For detailed information about supported platforms and installation requirements, see the Junos Pulse Supported Platforms Guide, which is available at http://www.juniper.net/support/products/pulse

On endpoints that connect to Junos Pulse Secure Access Service, if Junos Pulse is running on the Windows main desktop, you cannot launch Pulse within Secure Virtual Workspace (SVW). SVW is not supported with Pulse.

Before You Begin

Before you begin configuring Junos Pulse, be sure you have already configured your device network settings. Also be sure that you have defined the authentication settings, including the authentication servers and sign-in settings. Authentication Host Checker settings can directly affect a Junos Pulse installation because you can define the conditions that
an endpoint must meet to be allowed access to protected resources. For complete information about Host Checker, see the Junos Pulse Access Control Service Administration Guide.

- Introducing Junos Pulse on page 3

Junos Pulse Access Control Service Overview

To enable Pulse clients to connect to Junos Pulse Access Control Service, you configure the service so that when users request authentication, they are assigned a role based on the role mappings and optional security profile that you create. Access to specific resources is permitted only for users and devices that provide the proper credentials for the realm, that are associated with the appropriate roles, and whose endpoints meet security restrictions. If a user attempts to connect to the network from an endpoint that does not comply with the security restrictions you have defined, the user cannot access the realm or role.

As you plan your Pulse configuration, be sure you know how you want to deploy Pulse. You can use one or more of the following Junos Pulse deployment options:

- Use the defaults or make changes to the Junos Pulse default component set and default connection set, and then download and distribute Pulse by having users log in to the Pulse server’s user Web portal. After the installation is complete, users have all the connections they need to access network resources.

- Create the connections that an endpoint needs for connectivity and services, download the settings file (.jnprpreconfig), and download default Pulse installation program. For Windows endpoints you run the Pulse installation program by using an msiexec command with the settings file as an option. For OS X endpoints, you run the default installer and then import the .jnprpreconfig file using a separate command.

- Distribute Junos Pulse with no preconfiguration. You can download the default Junos Pulse installation file, and then distribute the file to endpoints using your organization's standard software distribution methods. Because the installer does not contain preconfigured connections, users must define network connections manually. Users can also automatically download a Pulse server’s dynamic connection by browsing to and logging into the Pulse Server’s Web portal. Dynamic connections are created as manual rather than automatic connections, which means that they are run only when the user initiates the connection or the user browses to a Pulse Server and launches Pulse from the server’s Web interface.

Configuring a Role for Junos Pulse Access Control Service

A role specifies network session properties for users who are mapped to the role. The following procedure describes configuration options that apply to a role that employs Junos Pulse. For complete information about all role configuration options, see the Junos Pulse Access Control Service Administration Guide.

To configure a role for Pulse endpoints:

1. From the admin console, select Users > User Roles > New User Role.
2. Enter a name for the role and, optionally, a description.
3. Click Save Changes. The role configuration tabs appear.
4. Set the following options:

   General > Restrictions

   • **Source IP**—Source IP options allow you to make an assignment to this role dependent on the endpoint's IP address or IP address range. To enable source IP address restrictions, select Allow or deny users from the following IP addresses, and then add IP addresses or address ranges. Select Allow to allow users to sign in from the specified IP address, or Deny to prevent users from signing in from the specified IP address. Then click Add. When you are finished making changes, click Save Changes.

   If you add multiple IP addresses, move the highest priority restrictions to the top of the list by selecting the check box next to the IP address, and then clicking the up arrow button. For example, to deny access to all users on a wireless network (10.64.4.100) and allow access to all other network users (0.0.0.0), move the wireless network address (10.64.4.100) to the top of the list and move the (0.0.0.0) network below the wireless network.

   • **Browser**—Browser options allow you to enforce the use of a particular type of browser for Web access to Pulse Access Control Service. Browser options apply only to operations that involve accessing Pulse Access Control Service through its user Web portal, such as acquiring a dynamic connection or installing Pulse through a role. Normal connection operations between the Junos Pulse client and Pulse server are not affected by browser restrictions.

   • **Certificate**—Certificate options allow you to require users to sign in from an endpoint that possesses the specified client-side certificate from the proper certificate authority. Before you enable this option, be sure that you have configured the client-side certificate on the Trusted Client CAs page of the admin console.

   • **Host Checker**—Host Checker options allow you to enable Host Checker polices, to choose one or more policies for the role, and specify whether the endpoint must meet all or just one of the selected Host Checker policies. The Host Checker policies that appear as Available Policies must be previously defined as part of the Endpoint Security settings in the Authentication section of the admin console. See the Junos...
General > Session Options

- **Session lifetime**—Session lifetime options allow you to set timeout values for user sessions. You can change the defaults for the following:
  - **Max. Session Length**—Specify the number of minutes a user session may remain open before ending. During a user session, prior to the expiration of the maximum session length, Pulse prompts the user to re-enter authentication credentials, which avoids the problem of terminating the user session without warning.
  - **Heartbeat Interval**—Specify the frequency at which the Pulse client should notify Pulse Secure Access Service to keep the session alive. You should ensure that the heartbeat interval of the agent is greater than the Host Checker interval, otherwise performance could be affected. In general, the heartbeat interval should be set to at least 50% more than the Host Checker interval.
  - **Heartbeat Timeout**—Specify the amount of time that Pulse Secure Access Service should wait before terminating a session when the endpoint does not send a heartbeat response.
  - **Auth Table Timeout**—Specify a timeout value for the auth table entry to be provisioned as needed. For more information about this setting, see the *Junos Pulse Access Control Service Administration Guide*.
  - **Reminder Time**—When the Enable Session Extension feature is enabled, the Reminder Time specifies the number of minutes prior to a session end when the server sends a notice through Pulse and notifies the user that the session will end soon.
  - **Enable Session Extension**—You can select the Enable Session Extension check box to allow Pulse users to continue a session beyond the maximum session length. If this feature is enabled, users can extend a session through the Pulse client user interface.

- **Roaming session**—Roaming allows user sessions to work across source IP addresses. Roaming session options include the following:
  - **Enabled**—Select this option to enable roaming for users mapped to this role. A roaming user session works across source IP addresses, which allows mobile users with dynamic IP addresses to sign in to Pulse Secure Access Service from one location and continue working from other locations.
  - **Limit to subnet**—Select this option to limit the roaming session to the local subnet specified in the Netmask box. Users may sign in from one IP address and continue using their sessions with another IP address as long as the new IP address is within the same subnet.
  - **Disabled**—Select this option to disable roaming user sessions for users mapped to this role. Users who sign in from one IP address may not continue an active
Infranet Controller session from another IP address; user sessions are tied to the initial source IP address.

**General > UI Options**

The UI options allow you to define Web page options that a user sees after a successful login to the Pulse Access Control server by means of a browser or the Pulse client. Be sure that you have already defined the authentication settings for this role. See the *Junos Pulse Access Control Service Administration Guide* for information on sign-in policies, sign-in pages, sign-in notifications, and authentication protocol sets.

5. Select the Agent tab. The "agent" is the client program for a user assigned to this role. When a user connects to the system using a Web browser, the agent is downloaded and installed if it is not already installed on the user's endpoint. Configure the following options.

   - Select **Install Agent for this role**.
   - Agent options appear only after you select this check box.

   - Select **Install Junos Pulse**.

6. In the **Session scripts** area, optionally specify a location for the following:

   - **Windows: Session start script**—Specify a script (.bat, .cmd, or .exe) to run for users assigned to the role after Pulse connects with Pulse Access Control Service. For example, you can specify a script that maps network drives on an endpoint to shares on protected resources. The script must be in a location (either local or on the network) that is accessible by the user.

   - **Windows: Session end script**—Specify a script (.bat, .cmd, or .exe) to run for users assigned to the role after Junos Pulse disconnects from Pulse Access Control Service. For example, you can specify a script that disconnects mapped network drives. If there is no start script defined, or the start script has not been run, the end script does not run. The script must be in a location (either local or on the network) that is accessible by the user.

7. Click **Save Changes**, and then select **Agent > Junos Pulse Settings**.

8. Select a component set that you have created, use the Default component set or select **none**. You would select **none** only if you are creating this role to distribute new or updated connections to existing Pulse users.

9. Click Save Changes.

10. Select **Users > User Realms > Select Realm > Role Mapping > New Rule** to configure role mapping rules that map Junos Pulse users to the role you configured.

**Related Documentation**

- Endpoint Security Monitoring and Management for Pulse Access Control Service on page 42
Client Connection Set Options for Pulse Access Control Service

A Junos Pulse client connection set contains network options and allows you to configure specific connection policies for client access to any Pulse server that supports Junos Pulse. Table 2 on page 25 describes connection set options.
## Table 2: Configurable Options for Junos Pulse Connection Sets

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Allow saving logon information</strong></td>
<td>Controls whether the Save Settings check box is available in logon dialog boxes in the Pulse client. If you clear this check box, the Pulse client always requires users to provide credentials. If you select this check box, users have the option of saving their credentials.</td>
</tr>
</tbody>
</table>
| **The Junos Pulse client can retain learned user settings.** These settings are retained securely on the endpoint, evolving as the user connects through different Pulse servers. The Junos Pulse client can save the following settings: | • Certificate acceptance  
• Certificate selection  
• Realm  
• Username and password  
• Proxy username/password  
• Secondary username/password  
• Role  |
| **NOTE:** If the authentication server is an ACE server or a Radius server and authentication is set to Users authenticate using tokens or one-time passwords, Pulse ignores the Allow saving logon information option. If the user sees a username and token prompt and the Save settings check box is disabled, Pulse supports soft token, hard token and smartcard authentication. |  |
| When a user opts to save settings, that information is used for each subsequent connection without prompting. If a setting changes, (for example, if a user changes a password), the saved setting is invalid and connection attempts fail. In this case, the user must use the client’s Forget Saved Settings feature, which clears all user saved settings. |  |
| **Allow user connections** | Controls whether connections can be added by the user. |
| **Display splash screen** | Clear this check box to hide the Pulse splash screen that normally appears when the Pulse client starts. |
| **Dynamic certificate trust** | Determines whether or not users can opt to trust unknown certificates. If you select this check box, a user can ignore warnings about invalid certificates and connect to the target Pulse server. |
| **Dynamic connections** | Allows connections within this connection set to be automatically updated or added to a Junos Pulse client when the user connects to the Pulse server through the user Web portal. Dynamic connections are created as manual rather than automatic connections, which means that they are run only when the user initiates the connection or the user browses to a Pulse Server and launches Pulse from the server’s Web interface. |
### Table 2: Configurable Options for Junos Pulse Connection Sets (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Wireless suppression</strong></td>
<td>Disables wireless access when a wired connection is available. If the wired connection is removed, Pulse enables the wireless connections with the following properties:</td>
</tr>
<tr>
<td></td>
<td>• Connect even if the network is not broadcasting.</td>
</tr>
<tr>
<td></td>
<td>• Authenticate as computer when computer information is available.</td>
</tr>
<tr>
<td></td>
<td>• Connect when this network is in range.</td>
</tr>
<tr>
<td><strong>NOTE:</strong></td>
<td>Wireless suppression occurs only when the wired connection is connected and authorized. If you enable wireless suppression, be sure to also configure a connection that enables the client to connect through a wired connection.</td>
</tr>
</tbody>
</table>

When you create a connection for a connection set, you choose a connection type. The following options are available for each connection type.

<table>
<thead>
<tr>
<th>UAC 802.1X options</th>
<th>Adapter type—Specifies the type of adapter to use for authentication: wired or wireless.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use this connection type to define authenticated connectivity to 802.1X devices, wired or wireless. Users cannot create 802.1X connections in the Pulse client interface. Users see 802.1X connections in the Pulse interface only when the connection has been deployed from the server and the specified network is available.</td>
<td>Outer username—Enables users to appear to log in anonymously while passing the actual login name (called the inner identity) through an encrypted tunnel. As a result, the user’s credentials are secure from eavesdropping and the user’s inner identity is protected. In general, enter anonymous, which is the default value. In some cases, you might need to add additional text. For example, if the outer identity is used to route the user’s authentication to the proper server, you might be required to use a format such as <a href="mailto:anonymous@acme.com">anonymous@acme.com</a>. If you leave the box blank, the client passes the user’s login name (inner identity) as the outer identity.</td>
</tr>
<tr>
<td>Scan List—Specify the wireless network SSIDs that the user can connect to.</td>
<td>Support Non-broadcast SSID—Allow users to connect to a non-broadcast wireless network from within the Pulse interface.</td>
</tr>
<tr>
<td>Trusted Server List (for UAC 802.1X Connection)</td>
<td>Server certificate DN—Specify the server certificate distinguished name (DN) and its signing certificate authority (CA). An empty DN field allows a client to accept any server certificate signed by the selected CA.</td>
</tr>
</tbody>
</table>
Table 2: Configurable Options for Junos Pulse Connection Sets (continued)

<table>
<thead>
<tr>
<th>SSL VPN or UAC (L3) options</th>
<th>Allow user to override connection policy—Allows a user to override the connection policy by manually connecting or disconnecting. Typically, you leave this option selected to make sure that a user can establish a connection under all conditions. If you disable this check box, the user cannot change the endpoint’s connection status or shut down Junos Pulse.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Support Remote Access (SSL VPN) or LAN Access (UAC) on this connection—This option must be selected if this connection is for Pulse Access Control Service. If the connection is for Pulse Secure Access Service, you can disable this check box and use the connection for accessing Pulse Collaboration meetings only by also selecting Support Remote Access (SSL VPN) or LAN Access (UAC) on this connection.</td>
<td></td>
</tr>
<tr>
<td>Support Remote Access (SSL VPN) or LAN Access (UAC) on this connection—This option must be disabled if this connection is for Pulse Access Control Service. If the connection is for Pulse Secure Access Service, you can enable this check box and use the connection for accessing Pulse Collaboration meetings.</td>
<td></td>
</tr>
<tr>
<td>This server—Specifies whether the endpoint connects to this Pulse server.</td>
<td></td>
</tr>
<tr>
<td>URL—Allows you to specify a URL for a different Pulse server as the default connection. Specify a different server’s URL to create connections for other Pulse servers in your network.</td>
<td></td>
</tr>
<tr>
<td>SRX options (for Dynamic VPN)</td>
<td>Address—Specifies the IP address of the SRX device.</td>
</tr>
<tr>
<td>Allow user to override connection policy—Allows users to override the connection policy by manually connecting or disconnecting. Typically, you leave this option selected to make sure that a user can establish a connection under all conditions. If you disable this check box, the user cannot change the endpoint’s connection status or shut down Junos Pulse.</td>
<td></td>
</tr>
<tr>
<td>App Acceleration options</td>
<td>Allow user to override connection policy—Allows a user to override the connection policy by manually connecting or disconnecting. Typically, you leave this option selected to make sure that a user can establish a connection under all conditions. If you disable this check box, the user cannot change the endpoint’s connection status or shut down Junos Pulse.</td>
</tr>
<tr>
<td>Community string—The Junos Pulse client and the Junos Pulse Application Acceleration Service can form an adjacency for application acceleration only if they belong to the same community as identified by the community string. When you create an App Acceleration connection, be sure the community string for the connection matches the community string defined on the Pulse Application Acceleration Service.</td>
<td></td>
</tr>
</tbody>
</table>

For all connection types, specify how the connection is established. The options vary according to the type of connection. Connections can be established using the following options:
Table 2: Configurable Options for Junos Pulse Connection Sets (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Manually by the user</strong></td>
<td>(All connection types.)</td>
<td>When the endpoint is started, the Junos Pulse client software is started, but no connection is attempted. The user must use the Junos Pulse client user interface to select a connection.</td>
</tr>
<tr>
<td><strong>Automatically after user signs into the desktop</strong></td>
<td>(All connection types.)</td>
<td>When the endpoint is started and the user has logged in to the endpoint, the Junos Pulse client software connects automatically. For App Acceleration connections, automatically is the default because Pulse forms an adjacency with Pulse Application Acceleration Service automatically if the service is available.</td>
</tr>
<tr>
<td><strong>NOTE:</strong></td>
<td></td>
<td>All connections on an endpoint that are configured to start automatically attempt to connect to their target networks at startup time. To avoid multiple connection attempts, be sure that only one connection is configured to start automatically or configure location awareness rules.</td>
</tr>
<tr>
<td><strong>Automatically when the machine starts. Machine credentials used for authentication</strong></td>
<td>(SSL VPN or UAC (L3) connections only)</td>
<td>Enables machine authentication, which requires that Active Directory is used as the authentication server and that machine credentials are configured in Active Directory.</td>
</tr>
<tr>
<td><strong>Automatically when the machine starts. Connection is authenticated again when the user signs into the desktop</strong></td>
<td>(SSL VPN or UAC (L3) connections only)</td>
<td>Enables machine authentication for the initial connection. After the user connects with user credentials, the machine authentication is dropped. When the user logs off, the machine authentication connection is restored.</td>
</tr>
<tr>
<td><strong>NOTE:</strong></td>
<td></td>
<td>If the machine and user have different roles, each role should map to the same connection set. Otherwise after the user connects, the existing connection set might be replaced.</td>
</tr>
<tr>
<td><strong>Automatically during desktop authentication. User is presented with the Junos Pulse credential tile at the logon screen</strong></td>
<td>(SSL VPN or UAC (L3) connections only)</td>
<td>This option enables Pulse client interaction with the credential provider software on the endpoint.</td>
</tr>
</tbody>
</table>

For SSL VPN or UAC (L3) and SRX connections that are set to have the connection established automatically, you can define location awareness rules that enable an endpoint to connect conditionally. For example, the endpoint connects to Pulse Access Control Service if it is connected to the company intranet or it connects to Junos Pulse Secure Access Service if it is in a remote location.

A Pulse connection uses the IP address of a specified interface on the endpoint to determine its network location. Each location awareness rule includes the following settings:

- **Name**—A descriptive name, for example, "corporate-DNS." A name can include letters, numbers, hyphens, and underscores.
- **Action**—The method the connection uses to discover the IP address. Choose one of the following values:
• **DNS Server**—Allows the endpoint to connect if the endpoint’s DNS server on the specified interface is set to one of the specified values. Use the Condition box to specify IP addresses or address ranges.

• **Resolve Address**—Allows the endpoint to connect if the hostname specified in the DNS Name box can be resolved by the DNS server for the specified interface. If one or more address ranges are specified in the Address Range box, the address must resolve to one of the ranges to satisfy the expression.

• **Endpoint Address**—Allows the endpoint to connect if the IP address of the specified interface is within a range specified in the IP Address Range box.

---

**NOTE:** To create a negative location awareness rule, you first create the positive state and then use rule requirement logic to use the rule as a negative condition.

---

**Creating a Client Connection Set for Pulse Access Control Service**

For detailed descriptions of each connection setting, see “Client Connection Set Options for Pulse Access Control Service” on page 24.

To create a Junos Pulse client configuration:

1. From the admin console, select **Users > Junos Pulse > Connections**.
2. Click **New**.
3. Enter a name and, optionally, a description for this connection set.

---

**NOTE:** You must enter a connection set name before you can create connections.

---

4. Click **Save Changes**.
5. From the main Junos Pulse Connections page, select the connection set.
6. Under Options, select or clear the following check boxes:

   - **Allow saving logon information**
   - **Allow user connections**
   - **Display Splash Screen**
   - **Dynamic certificate trust**
7. Under Connections, click New to define a new connection.
8. Enter a name and, optionally, a description for this connection.
9. Select a type for the connection. Type can be any of the following:
   • UAC 802.1X
   • SSL VPN or UAC (L3)
   • SRX
   • App Acceleration
10. If you select UAC 802.1X from the type list, enter a value or select or clear the following check boxes:
    • Adapter type—Select Wired or Wireless.
    • Outer username—Enter the outer username.
    • Scan list—Enter the SSIDs to connect to in your order of priority.
    • Support Non-broadcast SSID—Allow users to connect to a non-broadcast wireless network from within the Pulse interface.
11. Click Save Changes.
12. If you selected SSL VPN or UAC (L3) for the type, select or clear the following check boxes:
    • Allow user to override connection policy
    
    NOTE: If you disable this check box, the user cannot change the endpoint's connection status or shut down Junos Pulse.
    • Support Remote Access (SSL VPN) or LAN Access (UAC) on this connection
    • Enable Junos Pulse Collaboration integration on this connection
    • Connect automatically
    • This Server—This connection uses the URL of the server where you are creating the connection.
    • URL—If you did not enable This Server, specify the URL of the server for the connection.
13. If you select SRX, enter the IP address of the SRX device in the Address box and specify whether you want the user to be able to override connection policy.
14. If you select **App Acceleration**, select the **Connect Automatically** check box to permit
the client to automatically form an adjacency to an Junos Pulse Application
Acceleration Service in the network.

**NOTE:** For connections that use application acceleration, if Kaspersky
software is installed on the Pulse client endpoint, it must be configured
to allow traffic on UDP port 3578.

15. Specify how the connection is established, manually or automatically. These options
enable you to configure machine authentication and credential provider authentication.

16. (Optional) You can enable location awareness on automatic connections by creating
location awareness rules. Location awareness can force a connection to a particular
interface. See "Configuring Location Awareness Rules" on page 36 for more information.

17. (Optional) You can set preferred role and realm options for a machine authentication
connection. See "Junos Pulse Connection Realm and Role Preferences" on page 33
for more information.

18. After you have created the client connection set, create a client component set and
select this connection set.

page 42

**Securing the Connection State on the Junos Pulse Endpoint**

To disable user interaction with Pulse connections on the endpoint, you can configure
Junos Pulse connections so that when they are deployed to the endpoint, users cannot
shut down a connection or shut down Pulse. Disabling user interaction with Pulse enables
the Pulse administrator to control how endpoints connect to the network without allowing
the user to override administrative control. For example, if you use machine authentication,
the connection from endpoint to server is established automatically. By locking down
the Pulse endpoint, users cannot change their connection.

To secure the Pulse endpoint from the Pulse Access Control server:

1. Click **Users > Junos Pulse Connections**.
2. Edit or create a new connection.
3. Disable the check box labeled **Allow user to override connection policy**.
   This option is not available for UAC (802.1X) connections.

**Related Documentation**
- Client Connection Set Options for Pulse Access Control Service on page 24
- Endpoint Security Monitoring and Management for Pulse Access Control Service on
page 42
Machine Authentication

Machine authentication uses machine credentials (machine name and password or machine certificate) to authenticate the endpoint. You can enable machine authentication for Pulse Access Control Service as part of a Junos Pulse connection and distribute the connection to endpoints through the normal Pulse distribution methods.

The following describes the requirements for a machine authentication environment:

- Machine authentication for Pulse Access Control Service is available for Pulse layer 3 connections only.
- The authentication server used by the Pulse connection must be Active Directory/Windows NT for machine name/password authentication or a certificate server for machine certificate authentication. You can also use machine credentials when authenticating to RADIUS servers that verify the machine credentials against an Active Directory listing.
- The endpoint must be a member of a Windows domain and the machine credentials must be defined in Active Directory. Typically, during login, the user must enter domain/user in the username box.
- The Pulse connection must be configured so that no prompts are presented during the login process. For example, prompts for realm or role selection or a server certificate trust prompt cause the connection to fail.
- For machine certificate authentication, the domain workstation logon certificate must be issued by the domain certificate authority. The root certificate (CA) must be in the Machine Trusted Certificate store instead of the certificate store for a particular user.

To enable a Pulse connection for machine authentication:

1. Click **Users > Junos Pulse > Connections** and create or select a connection set.
2. Create or edit a connection. Machine authentication is available for connection type **SSL VPN or UAC (L3)** only.
3. Under Connection is established, select one of the following options:

   - **Automatically when the machine starts. Machine credentials used for authentication**—This option enables machine-only authentication. Machine credentials are used to connect to the Pulse Access Control Service before the user logs on. The user does not need to be logged in. The connection is maintained when a users logs on, logs off, or switches to a different logon.

   - **Automatically when the machine starts. Connection is authenticated again when the user signs in into the desktop**—This option enables user-after-desktop authentication. Machine credentials are used to authenticate the endpoint when no user is logged on. When a user logs on, the machine authentication connection is dropped and the user login is used instead. When the user logs off, the machine connection is reestablished.
When a Junos Pulse connection is configured to use machine authentication, any prompts that occur during the login process cause the connection to fail. For example, if the Pulse server authentication policy allows a user to select a realm or a role during the login process, Pulse presents a dialog box to the user and prompts for the realm or role selection. To avoid failed connections due to prompts during machine authentication you can specify a preferred role and realm for a Pulse connection.

For a Pulse connection that is used for machine authentication, you do not need to specify the preferred role if any of the following conditions are true:

- Users are mapped to only one role.
- Users are mapped to more than one role, but the realm's role mapping properties are set to merge settings for all assigned roles.

For a Pulse connection that is used for machine authentication, you must specify the preferred realm if the authentication sign-in policy allows the user to select a realm. If that realm maps to only one role, you do not need to specify the role.

For a Pulse connection that is used for machine authentication, you must specify the preferred role if any of the following conditions are true:

- The realm that the user connects to maps to more than one role and the realm's role mapping properties are set to require that the user must select a role. The preferred role set must be the name of a role assigned in that realm.
- The realm that the user connects to maps to more than one role and the realm's role mapping properties are defined by role mapping rules. You specify the preferred role by specifying the name of a rule that assigns the role set. Figure 3 on page 34 shows a role mapping rule with the rule name highlighted.
When you create a Pulse connection for machine authentication, you must use the connection type **SSL VPN or UAC (L3)**. To identify the connection as a machine authentication connection, you specify how the connection is established using one of the following options:

- **Automatically when the machine starts. Machine credentials used for authentication**
  
  This option uses the machine credentials defined in Active Directory for the machine login process and uses the same credentials for user login. When you select this option, the Realm and Role Set Preferences enable you to specify the following options:

  - **Preferred Machine Realm**—Type the realm name that maps to the role you want to assign.

  - **Preferred Machine Role Set**—Type the name of the role. The role must be one that is identified in the realm’s role mapping properties. Or specify the name of a role mapping rule that assigns the role set.

- **Automatically when the machine starts. Connection is authenticated again when the user signs in into the desktop**

  This option uses the Active Directory machine credentials for the machine login process. When machine login is complete, Pulse drops that connection and then uses the user credentials for user login. When you select this option, the Realm and Role Set Preferences enable you to specify the following options:

  - **Preferred Machine Realm**—Type the realm name that maps to the role you want to assign.

  - **Preferred Machine Role Set**—Type the name of the role. The role must be one that is identified in the realm’s role mapping properties. Or specify the name of a role mapping rule that assigns the role set.
• **Preferred User Realm**—Type the realm name that maps to the role you want to assign.

• **Preferred User Role Set**—Type the name of the role. The role must be one that is identified in the realm’s role mapping properties. Or specify the name of a role mapping rule that assigns the role set.

---

**NOTE:** Realm and role prompts are not the only prompts that are possible during the login process. If the Pulse connection has the Dynamic Certificate Trust option enabled, and there is an issue with the server certificate, Pulse asks the user if it is Ok to proceed. That certificate prompt causes a machine connection to fail. Note that the Pulse prompt for upgrading Pulse software is presented after the user connection is established and it will not affect a machine authentication connection.

---

### Credential Provider Authentication for Pulse Access Control Service

When Microsoft introduced Windows Vista and later Windows 7, it moved away from a logon integration interface based on GINA (Graphical Identification and Authentication) in favor of credential provider authentication. The Junos Pulse credential provider integration enables connectivity to a network that is required for the user to logon to the Windows domain. For example, the domain controller might reside behind a firewall and the endpoint uses credential provider login to connect to Pulse Access Control Service prior to domain login. Junos Pulse integrates with Microsoft credential providers to enable password based login and smart card login. A credential provider interface appears as a tile on a Windows Vista or Windows 7 login screen.

You enable Pulse credential provider support on a Pulse connection. After the connection has been downloaded to the endpoint through the normal Pulse distribution methods, a Pulse logon tile appears on the endpoint’s desktop. When the user initiates the logon process, Pulse establishes the connection.

The following describes the Pulse requirements for a credential provider environment:

- Credential provider authentication for Pulse Access Control Service is available for Pulse layer 3 connections only.

- If no smart card reader is configured on the endpoint, only the password based logon tile appears.
The Pulse connection may be configured so that Pulse service prompts are presented during the login process, for example, prompts for realm or role selection or a server certificate trust prompt.

Pulse upgrade notifications and actions are disabled during Credential Provider logon and postponed until the user connection is established. Host Checker remediation notifications are displayed.

Enabling Pulse credential provider support:

- Create a Pulse connection set for the role (Users > Junos Pulse > Connections), and then create a new Pulse connection. Credential Provider authentication is available with the SSL VPN UAC (L3) connection type. The configuration for the connection must have following item enabled in the section labeled Connection is established:
  - Automatically during desktop authentication. User is presented with the Junos Pulse credential tile at the logon screen.

Figure 4 on page 36 shows the settings for a Junos Pulse connection that enable the connection to interact with Microsoft Credential Providers.

Figure 4: Credential Provider Configuration for Pulse Connection

Configuring Location Awareness Rules

The location awareness feature enables a Junos Pulse client to recognize its location and then make the correct connection when the connection is set to connect.
automatically. For example, a Pulse client that is started in a remote location automatically connects to Junos Pulse Secure Access Service. But that same client automatically connects to Pulse Access Control Service when it is started in the corporate office.

**NOTE:** Location awareness and session migration are similar because they both simplify connectivity for the user, but they do so under different conditions. With location awareness, the Pulse client makes a decision on where to connect when a user logs in to the computer. Session migration occurs when the user puts the computer into a stand by or hibernate mode without first logging off, and then opens the computer in a different network environment. Location awareness enables the Pulse client to intelligently start a new session. Session migration enables Pulse servers to intelligently migrate an existing session.

Location awareness relies on rules you define for each connection. If the conditions specified in the rules are true, Pulse attempts to make the connection. To set up the location awareness rules that select among many connections, you must define location awareness rules for each connection. Each location awareness rule is based on the endpoint's ability to reach an IP address or resolve a DNS name over a specified network interface.

**NOTE:** Location awareness behavior is affected by split tunneling configuration. For example, if a location awareness rule relies on a address resolution made on the physical adapter, and split tunneling is disabled, the rule always resolves to FALSE after Pulse establishes the connection.

The following location awareness example includes two connections. The first connection is a Pulse Access Control Service connection that resolves to TRUE when the endpoint is connected to the corporate LAN. The second connection is Junos Pulse Secure Access Service connection that resolves to TRUE when the endpoint is located in a remote location.

**Pulse Access Control Service connection**

If the DNS server that is reachable on the endpoint's physical network interface is one of your organization's internal DNS servers, then establish the connection.

**Pulse Secure Access Service connection**

If the DNS server that is reachable on the endpoint's physical network interface is not one of your organization's internal DNS servers, and the DNS name of your Pulse Secure Access Service device resolves to the external facing IP address of the Pulse Secure Access Service device, then establish the connection.
Connections can be set to manual, automatic, or controlled by location awareness rules. When the user logs in, the Pulse client attempts every connection in its connections list that is set to automatic or controlled by location awareness rules.

To create a negative location awareness rule, you first create the positive state and then use rule requirement logic to use the rule as a negative condition.

To configure location awareness rules:

1. If you have not already done so, create a connection or open an existing connection.
   
   You can configure location awareness rules for Firewall connections and IC or SA connections. Location awareness rules do not apply to 802.1X or App Acceleration connections.

2. In the Connection is established area, select **According to location awareness rules**, and then click **New**.

3. Specify a name for the rule.

4. In the Action list, select one of the following:
   
   - **DNS server**—Connect if the DNS server associated with the endpoint’s network properties is (or is not) set to a certain value or set of values. Specify the DNS server IP address in the IP address box. Also specify a network interface on which the condition must be satisfied:
     
     - **Physical**—The condition must be satisfied on the physical interfaces on the endpoint.
     
     - **Junos Pulse**—The condition must be satisfied on the virtual interface that Junos Pulse creates when it establishes a connection.
     
     - **Any**—Use any interface.
   
   - **Resolve address**—Connect if the configured host name or set of host names is (or is not) resolvable by the endpoint to a particular IP address. Specify the host name in the DNS name box and the IP address or addresses in the IP address box. Also specify a network interface on which the condition must be satisfied.
NOTE: The Pulse client software evaluates IP and DNS policies on network interface changes. DNS lookups occur on DNS configuration changes or when the time-to-live setting (10 minutes) expires for a particular host record. If Pulse cannot resolve the host for any reason, it polls the configured DNS server list every 30 seconds. If the host had been resolved successfully previously and the time-to-live timer has not expired, the polling continues until the timer expires. If the host had not been resolved successfully previously, the resolution attempt fails immediately.

- **Endpoint Address**—Connect if a network adapter on the endpoint has an IP address that falls within or outside of a range or a set of ranges. Specify the IP address or addresses in the IP address box. Also specify a network interface on which the condition must be satisfied.

5. Click **Save Changes**.

After you create the rule or rules, you must enable each rule you want to use for the connection. To enable a negative form of a rule, use a custom version of the rule. To enable location awareness rules:

1. In the list of connection awareness rules for a connection, select the check box next to each rule you want to enable.

2. To specify how to enforce the selected location awareness rules, select one of the following options:
   - **All of the above rules**—The condition is TRUE and the connection is attempted only when all selected location awareness rules are satisfied.
   - **Any of the above rules**—The condition is TRUE and the connection is attempted when any select location awareness rule is satisfied.
   - **Custom**—The condition is TRUE and the connection is attempted only when all selected location awareness rules are satisfied according to the Boolean logic you specify in the Custom box. Use the Boolean condition to specify a negative location rule. For example, connect to Pulse Secure access service when Rule–1 is false and Rule–2 is true. The boolean logic in the custom box would be: **NOT Rule-1 AND Rule-2**. The accepted Boolean operators are AND, OR, NOT, and the use of ( ).

3. Click **Save Changes**.

**Related Documentation**
- Understanding Session Migration on page 119
- Junos Pulse Access Control Service Overview on page 20
**Access Control Service Component Set Options**

A Junos Pulse component set includes specific software components that provide Junos Pulse connectivity and services.

---

**NOTE:** Client component options affect Web-based installations only. For a preconfigured installer, specify components as part of the MSIEXEC command. The preconfigured installer for OS X installations always installs all components.

Component set options include the following choices:

- **All components**—Supports all Pulse connection types. The Enhanced Endpoint Security (EES) component, which is available only if you have an EES license, is included only if the user’s assigned role requires it. Use the **All components** option only when you want client endpoints to be able to connect to all supported Pulse servers and to be able to use application acceleration.

- **No components**—Updates existing Pulse client configurations, for example, to add a new connection. Do not use this setting for a new installation.

- **Minimal components**—Includes only the components needed to support the selected connections. For example, if the connection set you create includes an IC or SA connection, the component set includes only the components required to connect to Pulse Secure Access Service or Pulse Access Control Service. The default is Minimal components, which provides all needed components for the selected connections and limits the size of the Junos Pulse installation file.

---

**NOTE:** Do not deploy Pulse with Minimal components and no connections. If you do so, the Pulse client is not able to connect to any devices and users are not able to create any connections from within the Pulse client interface.

**NOTE:** Client component options affect Web-based installations only. For a preconfigured installer, specify components as part of the MSIEXEC command. The preconfigured installer for OS X installations always installs all components.

---

**Related Documentation**

- Junos Pulse Client Installation Overview on page 127

- Installing the Junos Pulse Client on OS X Endpoints Using a Preconfiguration File on page 138
- Creating a Client Component Set for Pulse Access Control Service on page 41
Creating a Client Component Set for Pulse Access Control Service

Client component options affect Web-based installations only. For a preconfigured installer, specify components as part of the MSIXEXEC command. The preconfigured installer for OS X installations always installs all components. To create a client component set:

1. From the admin console, select Users > Junos Pulse > Components.
2. Click New to create a new component set.
3. If you have not yet created a client connection set, select Users > Junos Pulse > Connections and create a new connection set. Or you can use the default client configuration, which permits dynamic connections, supports the outer username anonymous, and allows the client to automatically connect to Pulse Access Control Service or Pulse Secure Access Service.
4. Specify a name for the client component set.
5. (Optional) Enter a description for this client component set.
6. Select a connection set that you have created, or use the default connection set.
7. For Junos Pulse client components, select one of the following option buttons:
   - All components—Includes all Junos Pulse components and supports all access methods and all features.
   - No components—Updates existing Pulse client configurations, for example, to add new connections. This option works on endpoints if they already have Pulse installed. Do not use this option if you are installing Pulse.
   - Minimal components—Includes only the components needed to support the selected connections. For example, if the connection set you create includes an IC or SA connection, the component set includes only the components required to connect to Pulse Secure Access Service or Junos Pulse Access Control Service. The default is Minimal components, which provides all needed components for the selected connections and limits the size of the Junos Pulse installation file.

NOTE: Do not deploy Pulse with Minimal components and no connections. If you do so, the Pulse client is not able to connect to any devices and users are not able to create any connections from within the Pulse client interface.

NOTE: Client component options affect Web-based installations only. For a preconfigured installer, specify components as part of the MSIXEXEC command. The preconfigured installer for OS X installations always installs all components.
8. Click **Save Changes**.

9. After you create a component set, distribute the client to users through a role. When users access the role, the installer automatically downloads to the endpoint. The installer components and connections are applied to the endpoint client.

If client connections associated with the component set for a role are changed even though the list of components has not, the existing configuration on the endpoint is replaced immediately if the endpoint is currently connected, or the next time the endpoint connects.

If a user is assigned to multiple roles and the roles include different component sets, the first role in an endpoint’s list of roles is the one that determines which client (component set) is deployed.

**Endpoint Security Monitoring and Management for Pulse Access Control Service**

You can configure Host Checker policies that verify the endpoint’s operating system service pack, software version, or desktop application patch version compliance. Host Checker uses a list of the most current patch versions from the vendor for predefined rules in the Host Checker policy. Host Checker does not scan for non-security patches. Host Checker runs on Windows and Windows Mobile endpoints, Apple OS X and iOS endpoints, and on Google Android endpoints. The supported Host Checker features vary on each platform.

**NOTE:** If a realm has a Host Checker policy enabled that is for desktop clients, and a mobile device user employs a browser on the mobile device to connect to the Web portal, the login is denied because the desktop Host Checker program is not compatible with the mobile client OS. If Pulse mobile users are mapped to multiple roles, the login operation assigns them to a role where Host Checker is not enabled if possible. If all the roles have Host Checker enabled, the mobile users will not be allowed to login from the browser. You can create and enable Host Checker policies that are specific to each mobile operating system and then Host Checker runs when the Pulse client connects to the server.

The Pulse Access Control Service and Host Checker manage the flow of information between the corresponding pairs of TNC-based integrity measurement collectors (IMCs) and integrity measurement verifiers (IMVs). IMCs are software modules that run on the
host and collect information such as antivirus, antispyware, patch management, firewall, and other configuration and security information about the host. IMVs are software modules that run on Pulse Secure Access Service and verify a particular aspect of a host’s integrity. Each IMV works with the corresponding IMC on the client endpoint to verify that the endpoint meets the Host Checker rules. IMCs scan the endpoint frequently for changes in security status. For example, if the user turns off virus checking, the IMC can detect this and then trigger a new check to make sure the modified system complies with the requirements of the Host Checker policy. You can configure Host Checker to monitor third-party IMCs installed on client computers by using third-party IMVs that are installed on a remote IMV server.

You obtain the most current patch version information from a Juniper staging site. You can manually download and import the list into the Pulse server, or you can automatically import the list from the Juniper staging site or your own staging site at a specified interval.

Monitoring is based on one or more specified products or on specific patches, though not in the same policy. For example, you could check for Internet Explorer Version 7 with one policy, and Patch MS00-039: SSL Certificate Validation Vulnerabilities with a second policy. Then, apply both policies to endpoints at the role or realm level to ensure that the user has the latest browser version with a specific patch. In addition, for Microsoft products, you can specify the severity level of patches that you wish to ignore. For example, you could ignore low or moderate threats.

When you deploy Junos Pulse, Host Checker is included with the installer. You can invoke Host Checker at the role level or the realm level to specify access requirements for endpoints seeking authentication. Host Checker policies that are implemented at the realm level occur before the user is authenticated. Host Checker policies at the role level are implemented after authentication but before the user is permitted to access protected resources. When an endpoint first connects to Pulse Secure Access Service, the latest version of the IMC downloaded to the host computer. The initial check takes about 10–20 seconds to run. Outdated IMC files are automatically updated at subsequent checks.

NOTE: The first time an endpoint connects to a Pulse Secure Access Service that has a patch assessment policy, if the connection is a Layer 2 connection, the IMC cannot download. In this case, you should configure a remediation role that displays instructions to direct the user to retry with a Layer 3 connection or to contact the administrator.

For complete information on configuring Host Checker policies, see the Junos Pulse Access Control Service Administration Guide.
Remediation Options

Host Checker can identify issues on an endpoint. However, Host Checker and Pulse Secure Access Service cannot resolve issues, that is, perform remediation tasks, on non-compliant endpoints. To repair those issues Pulse Secure Access Service supports the following remediation options:

- **Instructions to the user**—The Pulse Secure Access Service can send a message to the user describing the non-compliant patches or software and a link to where the user can obtain the required software. Figure 5 on page 44 shows a typical Pulse remediation message.

Figure 5: Pulse Remediation Instructions

- **Initiate SMS/SCCM remediation**—For remediation using Microsoft System Center Configuration Manager (ConfigMgr or SCCM), formerly Systems Management Server (SMS), a pre-installed SMS/SCCM client on the endpoint is triggered by Host Checker.
to get patches from a preconfigured SMS/SCCM server. This mechanism installs only those patches that are published on the SMS/SCCM server.

- **Initiate Shavlik remediation**—Pulse Access Control Service and UAC Release 4.1 and later supports Shavlik remediation. Shavlik remediation is an optional licensed feature. After running Host Checker, if the endpoint requires remediation, the user can be prompted to install the required patches. You can configure remediation options to be launched automatically. The Shavlik patch deployment engine is downloaded to the endpoint. The engine links to the vendors’ patch repositories and installs the patches. Figure 6 on page 46 shows the Pulse client screens that a user sees when the Pulse server is configured with Host Checker and Shavlik remediation. The prompt that allows the user to decide whether to install the patches is a configuration option.

Issuing a Remediation Message with Pulse Access Control Service

If a Host Checker policy finds that an endpoint is not in compliance, Host Checker can display a message through the Pulse interface that includes custom instructions and reason strings on how to bring the endpoint into conformance. The user must perform the steps described in the message before the endpoint is allowed to access protected resources.

To enable a remediation message for a Host Checker policy:

1. In the admin console, select Authentication > Endpoint Security > Host Checker.
2. In the Policies section, click New to create a new Host Checker policy.
   For detailed information about Host Checker Rule Settings, see the Junos Pulse Access Control Service Administration Guide.
3. As part of the Host Checker Policy, select Enable Custom Instructions.
   When you select this option, a text box appears. Enter the instructions to display to the user on the Host Checker remediation page. You can use the following HTML tags to format text and to add links to resources such as policy servers or web sites: <i>, <b>, <br>, <font>, and <a href>. For example:
   You do not have the latest signature files.
   <a href="www.company.com">Click here to download the latest signature files.</a>
4. Optionally, select Send reason strings. Select this option to display a message to users (called a reason string) that is returned by Host Checker or IMV and that explains why the client machine does not meet the Host Checker policy requirements. Reason strings describe to users what the IMV is checking on the client machine. This option applies to predefined rules, to custom rules, and to third-party IMVs that use extensions in the Juniper Networks TNC SDK.
5. Click Save Changes.

Be sure to include the Host Checker policy in the realm or role you configure for Pulse users.
Using SMS/SCCM Remediation with Pulse Access Control Service

Junos Pulse supports the SMS/SCCM download method for patch deployment. If the Pulse Access Control Service is configured for the SMS/SCCM method for patch deployment, the Pulse client endpoint must have the SMS/SCCM client already installed on the endpoint, otherwise remediation fails.

Endpoints configured with SMS/SCCM for software management typically poll the server for updates every fifteen minutes or longer. In a worst-case scenario, clients that are not in compliance with existing Host Checker software requirements might have to wait until the next update interval to login. Using the SMS/SCCM download method, you can force the client to initiate the software update immediately after the patch assessment check. If a user attempts to log in, and the endpoint does not have a required software version for compliance with a Host Checker patch assessment policy, Host Checker immediately notifies the client to poll the server for an immediate update. The client receives notification that an SMS/SCCM update has started.

To configure SMS/SCCM to update the client when notified, set the advertisement time on the SMS/SCCM to As soon as possible.

You assign clients to a particular group or collection on the SMS/SCCM server and then server can advertise patches for that collection. You can configure roles on the Pulse Access Control Service that correspond to collections and SMS/SCCM can send the appropriate patches for a particular role.

You must have the SMS/SCCM client installed and configured correctly on endpoints, and the SMS/SCCM server must be reachable. In a Layer 2 network, Host Checker is performed before the endpoint is connected to the network. Host Checker can obtain the IP address of the SMS/SCCM server configured for the client. If the endpoint is out of compliance and remediation is necessary, Host Checker pings the server IP address every 15 seconds until the server can be notified to update the client.

You should inform users of the expected behavior if this feature is enabled, as there is no notification to the user until the SMS/SCCM sends back the advertisement.

NOTE: Juniper Networks recommends only one patch deployment on an endpoint at any point in time. However, there is no way to determine if an SMS/SCCM update is in progress, and so it may be possible that the patch deployment engine is started while an SMS/SCCM Update is also occurring. (This scenario is possible if Pulse is connected to two devices with one using SMS/SCCM remediation and the other using the Shavlik patch deployment engine.) Most patches do not allow two instances to be running, so one of the remediation operations will fail.

The admin console allows you to select only one Host Checker patch remediation option (either SMS/SCCM or Shavlik) for all Host Checker policies.
If Pulse is connected to both Pulse Access Control Service and Pulse Secure Access Service, and one uses SMS/SCCM remediation and the other uses Shavlik remediation, both requests are met. If both servers are configured to use Shavlik remediation, the requests are queued.

To enable SMS/SCCM assessment and remediation:

1. In the admin console, select Authentication > Endpoint Security > Host Checker.
2. In the Policies section, click New to create a new Host Checker policy.
   For detailed information about configuring Host Checker rules, see the Junos Pulse Access Control Service Administration Guide.
4. Click Save Changes.

Be sure to include the Host Checker policy in the realm or role you configure for Pulse users.

- Issuing a Remediation Message with Pulse Access Control Service on page 47
- Using Shavlik Remediation with Pulse Access Control Service on page 49

Using Shavlik Remediation with Pulse Access Control Service

Endpoints with Junos Pulse Release 2.0 or higher that are not in compliance with specified Host Checker patch policies can be updated with the required patches and brought into compliance automatically by the Shavlik patch deployment engine. The Host Checker IMC on the endpoint interfaces with the patch deployment engine to download and install missing patches reported by the IMV. Shavlik software runs on endpoints, downloads specified patches from vendors’ Web sites, and installs patches that are required through the Host Checker policy.

NOTE: A license is required for Shavlik patch monitoring and deployment.

The Shavlik patch deployment engine is an executable file that is hosted on the Pulse server and then downloaded to endpoints as part of the Pulse deployment. During a remediation operation, the deployment engine downloads patches directly vendor Web sites so Internet connectivity is needed for Shavlik remediation. The Shavlik patch deployment engine does not work with Layer 2 without Layer 3 connectivity.

All of the files required for patch assessment are a part of a Endpoint Security Assessment Plug-in (ESAP) from the Juniper Networks Customer Support Center ESAP packages beginning with UAC R4.1. The default ESAP package shipped with UAC R4.1 contains the required patch deployment files. Any older ESAP packages fail to update on these devices.
For information on how to update ESAP files, see the Junos Pulse Access Control Service Administration Guide.

The IMC and IMV software for patch monitoring is backward compatible. Since this feature is available from Pulse Release 2.0 onward, a new Pulse communicating with an older IMV (with Pulse support), or a new IMV communicating to an older IMC exhibit the same behavior as today. There should be no change in the patch assessment, and the Shavlik deployment engine is not invoked for remediation.

NOTE: Juniper Networks recommends only one patch deployment operation on an endpoint at any point in time. However, there is no way to determine if an SMS/SCCM update is in progress, and so it may be possible that the patch deployment engine is started while an SMS/SCCM Update is also occurring. (This scenario is possible if Pulse is connected to two devices with one using SMS/SCCM remediation and the other using the Shavlik patch deployment engine.) Most patches do not allow two instances to be running, so one of the remediation operations will fail.

The admin console allows you to select only one Host Checker patch remediation option (either SMS/SCCM or Shavlik) for all Host Checker policies.

If Pulse is connected to Junos Pulse Secure Access Service and Pulse Access Control Service, and one uses SMS/SCCM remediation and the other uses Shavlik remediation, both requests are met. If both servers are configured to use Shavlik remediation, the requests are queued.

To enable SMS/SCCM assessment and remediation:

1. In the admin console, select Authentication > Endpoint Security > Host Checker.
2. In the Policies section, click New to create a new Host Checker policy.
   
   For detailed information about configuring Host Checker rules, see the Junos Pulse Access Control Service Administration Guide.
4. To allow users to decide whether to install patch updates, select Prompt the user for consent before automatic patch deployment.
   
   Deploying patches can take some time to complete. Some patches require a system reboot.
5. If you enable the user prompt for installing patches, select a default action. The default action runs automatically if the user does not respond to the prompt within 1 minute. Select one of the following default actions:
   
   • Deploy patches
   • Do not deploy patches
6. Click Save Changes.
Enabling Enhanced Endpoint Security for Pulse Access Control Service

Host Checker includes integrated antispyware functionality that can detect and remediate Windows endpoints. Enhanced Endpoint Security (EES) ensures that malware, spyware, viruses, or worms are not present on endpoints that attempt to connect to Pulse Access Control Service, and that you can restrict or quarantine these endpoints according to your Host Checker policy configuration. When EES is running on an endpoint, the Pulse interface displays a security pane that shows EES status.

NOTE: By default, the base license allows two simultaneous endpoints to use this feature. You can purchase a separate license to enable additional users.

EES scans processes on endpoints, monitors file system write and execution operations, and can automatically remediate machines that are not in compliance. EES reports threats that are detected but not remediated. In some cases the user might be directed to reboot the machine to achieve compliance.

EES uses a signature database that is automatically downloaded to endpoints from Web Root Spy Sweeper servers on the Internet. The signature database is not hosted on Pulse Access Control Service. Endpoints must have access to the Internet for EES to run successfully. Additionally, if you configure default remediation roles, ensure that endpoints that are directed to remediation roles that can access *.webroot.com.

You can configure Pulse Access Control Service to determine the acceptable age of the signature database. The age of the database is the threshold used to determine whether a user can access resources by passing a Host Checker policy. For example, if signatures are 5 days old, and you configure the age as 3 days, the endpoint is allowed to access resources. If you configure the age as 4 days, the endpoint fails the Host Checker policy. Signature updates are performed regularly so endpoints should generally have the most current updates.

If Internet connectivity is not available to an endpoint before it connects to Pulse Access Control Service, and you have chosen to implement the option to check for signature age, the policy does not pass if the signatures are too old. For example, if a user has not accessed the endpoint for several days and the signatures are not up to date, the endpoint cannot access Pulse Access Control Service. To avoid this issue, you should create a default remediation role that allows limited access to the Internet for signature updates at *.webroot.com.

Any endpoint that is configured for an EES scan at Layer 2 always fails the check. To permit a network connection, you should configure the realm to reassign users to a
remediation VLAN. This allows endpoint users to connect and download the required signature updates, or if connecting for the first time, the EES installer package.

You configure EES on the Endpoint Security > Host Checker main page to ensure that multiple policies are not created, and that the same policy is used across all realms and roles for which you have enabled it. When you create a realm or a role, you can enable EES restrictions in addition to any other Host Checker policies.

**NOTE:** If you configure an EES policy for endpoints, a separate EES installer (about 5 MB) is downloaded to endpoints on their first attempt to access resources protected by a Host Checker EES policy. User endpoints are scanned for offending software, and signatures are automatically installed.

**User Experience**

A significant amount of data is downloaded (approximately 5 MB for the installer and approximately 12 MB for the signatures), followed by the memory scan. After installation, signatures are updated and the memory scan is performed to verify that no spyware is loaded in memory. The download, update, and scan can take significant time to complete.

Any threat detected is automatically remediated by Host Checker and is not reported. If threats cannot be remediated, the endpoint reports back to the server. Roles and user sessions can be adjusted based on endpoint compliance. A number of user strings automatically notify the user of the compliance status.

To enable and use EES antispyware:

1. In the admin console, click Authentication > Endpoint Security > Host Checker.
2. Under Options, select the Advanced Endpoint Protection: Malware Protection tab.
3. Select the Enable Advanced Endpoint Protection: Malware Protection check box.
4. To set the age of the signature definitions database, select the Signature definitions should not be older than check box. Enter the frequency in days (3 - 30). This number determines the maximum permissible age of signatures. It does not change the frequency of updates.
5. To enable an immediate EES scan in the background after allowing the network connection, select the Install EES and scan endpoints after network connection is established check box.

   Choose this option to allow an immediate connection before the scan takes place. This option allows users to connect and to begin work more quickly. However, this option is less secure because it allows network access before the endpoint has been scanned for malware.
6. Click Save Changes.

When you create or configure realm or role Host Checker restrictions, you can select Enhanced Endpoint Security: Malware Protection to apply to that role or realm.
Pushing Junos Pulse Configurations Between Pulse Servers of the Same Type

You can use the Push Configuration feature to centrally manage Junos Pulse connections, components, and uploaded Pulse packages. The Push Configuration feature enables you to copy all configuration settings or selected configuration settings from one Pulse server to another Pulse server of the same type, for example, from one SA Series SSL VPN Appliance to another SA Series SSL VPN Appliance to another.

This section describes how to use the Push Configuration feature to centrally manage Pulse. For complete details about using Push Configuration, see the appropriate administration guide.

The following notes apply to pushing configurations:

- You can push to a single Pulse server or to multiple Pulse servers in one operation. You can push up to 8 targets per push operation. You can run up to 25 push operations simultaneously. The maximum number of targets is 200. If a push to a target Pulse server fails, the operation proceeds to the next target until all identified targets are updated. The results page displays the status and any problems encountered during the process.

- You can push to a Pulse server that is a member of a cluster as long as the target Pulse server is not a member of the same cluster as the source.

- Target Pulse servers can refuse pushed configuration settings. The default is to accept.

- After an update, the target Pulse server restarts its services. Brief interruptions might occur while the service restarts. We recommend that you push to targets when they are idle or when you can accommodate brief interruptions.

- Target Pulse servers do not display a warning message when they receive a pushed configuration.

- The target Pulse server automatically logs out administrators during the push process.

- The source and target Pulse servers must have the same build version and number.

- The administrator account on the source Pulse server must sign in to the target Pulse server without any human intervention. For example, you cannot have dynamic credentials or multiple roles that are not merged as these both require manual interaction.
Before you use Push Configuration, you must configure your system according to the following conditions:

- You must map to the .Administrators role, thereby creating a “super administrator” with full administration privileges. Modify Authentication > Auth Servers > Administrator Server > Users settings to add yourself to the .Administrators role.

- The target Pulse server administrator account must use static password authentication or two-factor tokens that do not use challenge/response type authentication. For example, certificates, Soft ID, and Defender Authentication are not supported. Modify Administrators > Admin Realms > [Administrator Realm] > General settings to select the proper authentication server for the administrator realm.

- Do not configure the administrator account in a way that requires the administrator to select a role to sign in to the target Pulse server. For example, do not map a single user to multiple roles, including the Push Configuration administrator role, and then fail to merge those roles. We recommend creating an account exclusively for Push Configuration administrators to guarantee that the administrator does not need to choose a role during the sign-in process and to clearly distinguish the actions of Push Configuration administrators in your log files. Use the Administrators > Admin Realms > [Administrator Realm] > Role Mapping settings to set the appropriate role-mapping rules.

To push Junos Pulse configurations from one Pulse server to other Pulse servers of the same type:

1. If you have not already done so, define the targets by selecting Maintenance > Push Config > Targets. For detailed procedures on how to define targets, see the appropriate administration guide.

2. From the admin console, select Maintenance > Push Config > Push Configuration.

3. In the What to push box, select Selected configuration to display the configuration categories.

4. Scroll down the list and expand the item labeled Junos Pulse.

5. Select the Select All Configurations check box to push all Junos Pulse configurations on this Pulse server. Or chose none, all, or selected items from the following categories:
   - Junos Pulse Connections—Connection sets and connections.
   - Junos Pulse Components—Component sets.
   - Junos Pulse Versions—Pulse packages that were uploaded to the Pulse server.

6. Add the targets to the Selected Targets box.

7. Click Push Configuration.

Enabling or Disabling Automatic Pulse Upgrades

After you deploy Junos Pulse client software to endpoints, software updates occur automatically. If you upgrade the Pulse client configuration on your Pulse server, updated software components are pushed to a client the next time it connects.

NOTE: When you configure Junos Pulse to make 802.1x based connections, a reboot may be required on Windows XP endpoints when Pulse is upgraded.

NOTE: A bound endpoint receives connection set options and connections from its binding server, but it can have its Pulse client software upgraded from any Pulse server that has the automatic upgrade option enabled. During a client software upgrade the client loses connectivity temporarily.

Pulse client software upgrades are enabled by default. To change the behavior of Pulse client upgrades:

1. From the admin console, select Maintenance > System > Options.
2. Set or clear the Enable automatic upgrade of Junos Pulse Clients check box.
3. Click Save Changes.

Related Documentation

• Upgrading Junos Pulse Software on page 55

Upgrading Junos Pulse Software

The software image for each supported Pulse server includes a Junos Pulse client software package. When a newer version of Pulse is available, you can upload the new software to the Pulse server. You can have more than one version of Pulse on a Pulse server but only one Pulse client package can be active. If you activate a new version of Pulse, and if the Pulse server’s automatic upgrade option is enabled, connected Pulse clients display an upgrade prompt to the user. The user can choose to install the upgrade or cancel the operation. If a user cancels, the upgrade prompt appears each time the client connects to the server. During a client software upgrade the Pulse client loses connectivity temporarily.

NOTE: When you configure Junos Pulse to make 802.1x based connections, a reboot may be required on Windows XP endpoints when Pulse is upgraded.
After you have staged the new Pulse software package in a location accessible to the Pulse server, use the following procedure to upload the software to the Pulse server:

1. In the device admin console, select Users > Junos Pulse > Components.
2. In the section labeled Manage Junos Pulse Client Versions, click Browse, and then select the software package.
3. Click Upload.

Only one Junos Pulse software package can be active at a time. After you upload a new package, you need to enable it.

To enable a Pulse package as the default:

1. In the admin console, select Users > Junos Pulse > Components.
2. In the section labeled Manage Junos Pulse Client Versions, select the radio button next to a version, and then click Activate.

Before You Begin Configuring Junos Pulse Secure Access Service

Before you begin configuring Junos Pulse, be sure that you have already configured SA Series SSL VPN network settings. Also be sure that you have defined the Authentication settings, including the authentication servers and sign-in settings. The Authentication and Host Checker settings can directly affect a Pulse installation because you can define the conditions that an endpoint must meet to be allowed access to protected resources.

Junos Pulse Secure Access Service Overview

To enable Junos Pulse Secure Access Service, you configure the service so that when users request authentication, they are assigned a role based on the role mappings and optional security profile that you create. Access to specific resources is permitted only for users and devices that provide the proper credentials for the realm, that are associated with the appropriate roles, and whose endpoints meet security restrictions. If a user attempts to connect to the network from an endpoint that does not comply with the security restrictions you have defined, the user cannot access the realm or role.

As you plan your Pulse configuration, be sure you know how you want to deploy the Pulse client software. You can use one or more of the following Pulse deployment options:

- Use the defaults or make changes to the Junos Pulse default component set and default connection set, and then download and distribute Pulse by having users log in to the Pulse server's user Web portal and be assigned to a role. After the installation is complete, users have all the connections they need to access network resources.
- Create the connections that an endpoint needs for connectivity and services, download the settings file (.jnprpreconfig), and download default Pulse installation program. For Windows endpoints you run the Pulse installation program by using an msiexec command with the settings file as an option. For OS X endpoints, you run the default installer and then import the .jnprpreconfig file using a separate command.
- Distribute Junos Pulse with no preconfiguration. You can download the default Junos Pulse installation file in either .msi or .exe format from a Pulse server, and then distribute the file to endpoints using your organization's standard software distribution methods. Because the installer does not contain preconfigured connections, users must define network connections manually. Or you can create dynamic connections on each Pulse server. These connections are automatically downloaded to the installed Pulse client when users provide their login credentials to the Pulse server's user Web portal. Dynamic connections are created as manual rather than automatic connections, which means...
that they are run only when the user initiates the connection or the user browses to a Pulse Server and launches Pulse from the server's Web interface.

The following tasks summarize how to configure Junos Secure Access Service:

- Create and assign user roles to control who can access different resources and applications on the network. If you are converting your access environment from agentless or a Network Connect environment, you should create new roles that are specific for Junos Pulse.
- Define security restrictions for endpoints with Host Checker policies.
- Define user realms to establish authentication domains. If you are converting your access environment from agentless or a NC environment, typically you can use your existing realms.
- Associate the roles with appropriate realms to define your access control hierarchy using role mapping.
- Define Junos Pulse component sets, connection sets, and connections.
- Deploy Junos Pulse to endpoints.

**Junos Pulse and IVS**

The Junos Pulse for Windows client is not compatible with the Instant Virtual System (IVS) feature of SA Series Appliances. In an IVS system, a Pulse client always takes its IP address from the root IVE address pool instead of using the pool defined for the virtualized IVE.

**Related Documentation**

- Creating a Client Connection Set for Pulse Secure Access Service on page 79
- Configuring a Role for Junos Pulse Secure Access Service on page 59

**Configuring a Role for Junos Pulse Secure Access Service**

A user role defines session settings and options, personalization settings (user interface customization and bookmarks), and enabled access features (Web, file, application, Telnet/SSH, Terminal Services, network, meeting, and e-mail access). A user role does not specify resource access control or other resource-based options for an individual request. For example, a user role can define whether or not a user can perform Web browsing when the user is connected through the Pulse Secure Access server Web portal. However, the individual Web resources that a user may access are defined by the Web resource policies that you configure separately.

The following procedure describes the role configuration options that apply to a role that employs Pulse.
To create a role for Junos Pulse endpoints:

1. Select **Users > User Roles > New User Role** in the admin console.

2. Enter a name for the role and, optionally, a description. This name appears in the list of roles on the Roles page.

3. **Under Client Options**, select **Junos Pulse**.

   When this option is enabled, the Junos Pulse button appears on the Secure Access Service Web portal. When a user clicks it, Pulse is downloaded and installed on the user’s endpoint.

   Enabling this option alone does not enable Pulse as the client for the role. This option works in conjunction with the settings you enable in the Access Features section and then configure on the respective role tabs. The combination of settings determines whether you enable Junos Pulse, Junos Pulse for Secure Application Manager (SAM), or Network Connect. The following procedures describe how to enable each client option.

To enable Junos Pulse:

a. In the role’s **General > Overview > Options** section select **Junos Pulse**.

   This setting applies to both Windows and Apple OS X versions of Junos Pulse.

b. In the Access Features section select **VPN Tunneling**.

   The VPN Tunneling tab enables you to specify split tunnel behavior, specify the Pulse component set, and enable 3rd-party software integrations.

To enable Junos Pulse for SAM:

a. In the Options section select **Junos Pulse**.

b. In the Access Features section select **Secure Application Manager** and then select **Windows version**.

   The SAM tab enables you to specify applications and servers secured by SAM.

To enable Network Connect:

a. In the Options section make sure **Junos Pulse** is disabled.

b. In the Access Features section select **VPN Tunneling**.

4. Click **Save Changes**. Role configuration tabs appear.

---

**NOTE:** When the Junos Pulse option is enabled and no other access method (VPN Tunneling, WSAM) is enabled, then no client will be delivered.
Configuring General Role Options for Pulse Secure Access Service

The General tab includes options for detailed control of how the client interacts with the server and the network. The following describes the options that apply to Junos Pulse.

**General > Restrictions**

Source IP—Control from which IP addresses users can access the Web portal sign-in page, be mapped to a role, or access a resource.

Browser—Allow or deny access to the role based on the browser’s user agent string.

Certificate—Allow all users or only users with a signed client-side certificate.

Hot Checker—Select configured Host Checker policies to enforce with this role.

**General > VLAN/Source IP**

VLAN and Select Source IP—To direct traffic to specific sites based on the role, you can define a source IP alias for each role and then use the alias to configure virtual ports you define for the internal interface source IP address. A back-end device can then direct end user traffic based on the alias. This capability enables you to direct various end users to defined sites based on their roles, even though all of the end user traffic has the same internal interface source IP address. For more information, see the Junos Pulse Secure Access Service Administration Guide.

**General > Session Options**

Idle Timeout—The maximum time a session can remain idle (no traffic) before the server ends the session.

Max. Session Length—The maximum time for a session before the server ends the session.

Reminder Time—When the Enable Session Extension feature is enabled, the Reminder Time specifies the number of minutes prior to a session end when the server sends a notice through Pulse and notifies the user that the session will end soon.

Enable Session Extension—Allows the user to extend the session. The user can choose to extend the session at any time by selecting a menu option in the Pulse client interface. If the Session Timeout Warning is selected, a notice message appears when the Reminder Time is reached and the user can choose to extend the session from within that notice message.

Enable Session Timeout Warning—Enables or disables the session timeout warning, which notifies the user when their Pulse VPN session is close to expiring. The Reminder Time value specifies the point at which the reminder appears.

Roaming Session—Select one of the following options to specify the client’s roaming behavior:

- **Enabled**—A roaming session allows a user to retain connectivity when moving a device, such as a laptop with a dynamic IP address, from one subnet to another. Disable this feature to prevent users from accessing a previously established...
session from a new source IP address. Disabling roaming can help protect against an attack that spoofs a user’s session.

- **Limit to Subnet**—Limit the roaming session to the local subnet specified in the endpoint’s IP configuration. Users may sign in from one IP address and continue using their sessions with another IP address as long as the new IP address is within the same subnet.

- **Disabled**—Disable roaming user sessions for users mapped to this role.

**Browser Session Cookie**—Select **Enabled** to remove the Secure Access Service session cookie and log users out of their Secure Access Service web session after the Pulse client is launched. Removing the browser session cookie enhances Pulse session security.

**General > UI Options**

**UI Options**—The settings on this page define the Pulse Secure Access Service Web portal page.

**SAM > Applications**

**Add Application**—We recommend that you use resource profiles to specify the applications available to Pulse for Windows Mobile users, but you can use role and resource policy settings instead.

**SAM > Options**

**Auto-uninstall Secure Application Manager**—This feature is not applicable to the Windows Mobile client. Users must download and install Pulse for Windows Mobile before the Windows Mobile device can connect to the Pulse Secure Access Service.

**Prompt for username and password for intranet sites**—If you enable this option, the Pulse Secure Access Service requires users to enter sign-in credentials before connecting to sites on your internal network. This option changes Internet Explorer’s intranet zone setting so that Internet Explorer always prompts the user for network sign-in credentials for an intranet site.

**Auto-upgrade Secure Application Manager**—This feature is not applicable to the Pulse for Windows Mobile app.

**Resolve only host names with domain suffixes in the device DNS domains**—If you enable this option, users can only browse to Web sites that are part of their login domain.

**Session start script and Session end script**—This feature is not applicable to the Pulse for Windows Mobile app.

**Configuring Role Options for Pulse Secure Access Service**

All of the options for role configuration tabs are described in the *Junos Pulse Secure Access Service Administration Guide*. 
To configure role options for Junos Pulse endpoints:

1. From the admin console, select **Users > User Roles**.
2. Click the role you want to configure and then click the VPN Tunneling tab.
3. Under Split Tunneling Options, select your options:
   - **General VPN Options** apply to all layer 3 VPN clients, Junos Pulse, Network Connect, and third-party IKEv2 clients:
     - **Split Tunneling**—Split tunneling options let you define how network traffic flows on the client.
       - **Enable**—Pulse modifies routes on the client so that traffic meant for the corporate intranet uses the virtual adapter created by Pulse (the Pulse tunnel) and all other traffic goes through the local physical adapter.
       - **Disable**—When the Pulse session is established, predefined local subnet and host-to-host routes that might cause split-tunneling behavior are removed, and all network traffic from the client goes through the Pulse tunnel. With split tunneling disabled, users cannot access local LAN resources during an active VPN session.

   **NOTE:** Location awareness behavior is affected by split tunneling configuration. For example, if a location awareness rule relies on an address resolution made on the physical adapter, and split tunneling is disabled, the rule always resolves to FALSE after Pulse establishes the connection.

   - **Juniper Client Options** apply only to Junos Pulse and Network Connect:
     - **Route Precedence**—You can define which routing table takes precedence:
       - **Tunnel Routes**—The route table associated with the Pulse virtual adapter take precedence. Pulse overwrites the physical interface routes if there is conflict between the Pulse virtual adapter and the physical adapters. Pulse restores the original routes when the connection is ended.
       - **Endpoint Routes**—The route table associated with the endpoint’s physical adapter take precedence.

     - **Route Monitor**—Pulse can monitor the route tables and take appropriate action.
       - **Yes**—Pulse ends the connection if a change is made to the routing tables.
       - **No**—Route tables are allowed to change on the client endpoint.

     - **Enable TOS Bits Copy**—Enables you to control the client behavior in networks that employ Quality of Service (QoS) protocols. When you enable this check box, the Juniper client copies IP Type of Service (TOS) bits from the inner IP header to outer the IP Header. Note that enabling this option might require a reboot of the client endpoint when the client software is installed for the first time on Windows endpoints. Juniper clients support TOS bit copy only for IPSec transport and not for SSL transport.
• **Multicast**—Enables the multicast feature on the client when this option is selected.

• **Auto-launch**—Activates the Juniper client software automatically when the endpoint is started when this option is selected.

**Options for Juniper client on Windows** apply only to Junos Pulse and Network Connect on Windows endpoints:

• **Launch client during Windows Interactive User Logon**—When this option is enabled, the Juniper client starts when the user logs into Windows. Note that this setting is not the same as the Pulse connection settings that control machine authentication and credential provider authentication. Choose one of the following options:

  **Require client to start when logging into Windows**

  **Allow user to decide whether to start client when logging into Windows**

• **Windows: Session start script**—Specify a script (.bat, .cmd, or .exe) to run for users assigned to the role after Junos Pulse connects with Pulse Secure Access Service. For example, you can specify a script that maps network drives on an endpoint to shares on protected resources.

• **Windows: Session end script**—Specify a script (.bat, .cmd, or .exe) to run for users assigned to the role after Junos Pulse disconnects from Pulse Secure Access Service. For example, you can specify a script that disconnects mapped network drives. If there is no start script defined, or the start script has not been run, the end script does not run.

**Options for Juniper client on Mac** apply only to Junos Pulse and Network Connect on Apple OS X endpoints:

• **Mac: Session start script**—Specify a script (.bat, .cmd, or .exe) to run for users assigned to the role after Junos Pulse connects with Pulse Secure Access Service. For example, you can specify a script that maps network drives on an endpoint to shares on protected resources.

• **Mac: Session end script**—Specify a script (.bat, .cmd, or .exe) to run for users assigned to the role after Junos Pulse disconnects from Pulse Secure Access Service. For example, you can specify a script that disconnects mapped network drives. If there is no start script defined, or the start script has not been run, the end script does not run.

4. In the **Session scripts** area, optionally specify a location for the following:

5. Click **Save Changes**.

**NOTE:** See the *Junos Pulse Secure Access Service Administration Guide* for information on Advanced Options and options that apply to Linux endpoints.
Configuring Role Options for Host Checker for Pulse Secure Access Service

Host Checker options allow you to enable configured Host Checker policies, to choose one or more policies for the role, and to specify whether the endpoint must meet all or just one of the selected Host Checker policies. Before you can assign Host Checker policies for a role, you must have already defined the policies. See the Junos Pulse Secure Access Service Administration Guide for complete information on configuring authentication and endpoint security settings.

To configure Host Checker for a selected role:

1. For a selected role, select General > Restrictions > Host Checker.
2. Select the check box Allow users whose workstations meet the requirements specified by these Host Checker policies.
3. Click Add to move Host Checker policies from the Available Policies list to the Selected Policies list.
4. Select the check box Allow access to the role... to grant access if the endpoint passes any of the selected Host Checker policies.
5. Click Save Changes.

Machine Authentication for Pulse Secure Access Service

Machine authentication uses machine credentials (machine name and password or machine certificate) to authenticate the endpoint. You can enable machine authentication for Pulse Secure Access Service as part of a Junos Pulse connection and distribute the connection to endpoints through the normal Pulse distribution methods.

The following describes the requirements for a machine authentication environment:

- Machine authentication for Pulse Secure Access Service is available for Pulse layer 3 connections only.
- The authentication server used by the Pulse connection must be Active Directory/Windows NT for machine name/password authentication or a certificate server for machine certificate authentication. You can also use machine credentials when authenticating to RADIUS servers that verify the machine credentials against an Active Directory listing.
- The endpoint must be a member of a Windows domain and the machine credentials must be defined in Active Directory. Typically, during login, the user must enter domain/user in the username box.
• The Pulse connection must be configured so that no prompts are presented during the login process. For example, prompts for realm or role selection or a server certificate trust prompt cause the connection to fail.

• For machine certificate authentication, the domain workstation logon certificate must be issued by the domain certificate authority. The root certificate (CA) must be in the Machine Trusted Certificate store instead of the certificate store for a particular user.

To enable a Pulse connection for machine authentication:

1. Click Users > Junos Pulse > Connections and create or select a connection set.
2. Create or edit a connection. Machine authentication is available for connection type SSL VPN or UAC (L3) only.
3. Under Connection is established, select one of the following options:
   - **Automatically when the machine starts. Machine credentials used for authentication**—This option enables machine-only authentication. Machine credentials are used to connect to the Pulse Secure Access Service before the user logs on. The user does not need to be logged in. The connection is maintained when a users logs on, logs off, or switches to a different logon.
   - **Automatically when the machine starts. Connection is authenticated again when the user signs in into the desktop**—This option enables user-after-desktop authentication. Machine credentials are used to authenticate the endpoint when no user is logged on. When a user logs on, the machine authentication connection is dropped and the user login is used instead. When the user logs off, the machine connection is reestablished.

### Credential Provider Authentication for Pulse Secure Access Service

When Microsoft introduced Windows Vista and later Windows 7, it moved away from a logon integration interface based on GINA (Graphical Identification and Authentication) in favor of credential provider authentication. The Junos Pulse credential provider integration enables connectivity to a network that is required for the user to logon to the Windows domain. For example, the domain controller might reside behind a firewall and the endpoint uses credential provider login to connect to Pulse Access Control Service prior to domain login. Junos Pulse integrates with Microsoft credential providers to enable password based login and smart card login. A credential provider interface appears as a tile on a Windows Vista or Windows 7 login screen.

You enable Pulse credential provider support on a Pulse connection. After the connection has been downloaded to the endpoint through the normal Pulse distribution methods, a Pulse logon tile appears on the endpoint’s desktop. When the user initiates the logon process, Pulse establishes the connection.
The following describes the Pulse requirements for a credential provider environment:

- Credential provider authentication for Pulse Secure Access Service is available for Pulse layer 3 connections only.
- The endpoint must already have Microsoft credential provider support configured and enabled.
- The Pulse connection may be configured so that prompts are presented during the login process, for example, prompts for realm or role selection or a server certificate trust prompt.
- Pulse upgrade notifications and actions are disabled during Credential Provider logon and postponed until the user connection is established. Host Checker remediation notifications are displayed.

Enabling Pulse credential provider support:

- Create a Pulse connection set for the role (Users > Junos Pulse > Connections), and then create a Pulse connection. Credential Provider authentication is available with the SSL VPN UAC (L3) connection type. The configuration for the connection must have following item enabled in the section labeled Connection is established:
  - Automatically during desktop authentication. User is presented with the Junos Pulse credential tile at the logon screen.

Figure 8 on page 67 shows the Junos Pulse connection settings to enable Credential Provider logon.

Figure 8: Credential Provider Configuration for Pulse Connection

**Configuring Pulse for Secure Application Manager**

Junos Pulse supports Secure Application Manager (SAM). SAM provides remote access using application names and destinations. SAM does not require a virtual adapter or virtual IP address on the endpoint. SAM provides secure access to client/server applications and thin client solutions without provisioning a VPN tunnel.

With Pulse R3.0 and later, SAM connectivity is provided through SSL VPN (Pulse connection type SSL VPN or UAC (L3)). Prior to Pulse R3.0, SAM connectivity was provided through a separate client. In addition, the Pulse for Windows Mobile app uses SAM to provide access to Windows Mobile smartphones, and that requires a different role. Table 3 on page 68 describes the progression of Pulse/SAM client software.

<table>
<thead>
<tr>
<th>Pulse/SAM Version</th>

</table>
This section describes how to configure Junos Pulse Secure Access Service to support Windows endpoints. Pulse Secure Access Service also supports a Java-based SAM client (JSAM). The JSAM client can be deployed from a Pulse Secure Access server to any endpoint that supports Java. For more information on JSAM, see the Junos Pulse Secure Access Service Administration Guide.

To enable SAM for Windows endpoints and configure a role:

1. Log in to the Pulse Secure Access Service admin console.
2. Select User Roles > New User Role.
3. On the New Role page, specify a name for the role and, optionally, a description. Make note of the name because later in this procedure, you create a realm and map realm users to this role.
4. In the Options section, select Junos Pulse.

**NOTE:** If you leave the Junos Pulse check box cleared, and then enable Secure Application Manager, Windows version in the Access Features section, you enable the Pulse/SAM for the Pulse for Windows Mobile smartphone app. The Junos Pulse check box must be selected to enable the role for Pulse for Windows endpoints.

5. In the Access Features section of the New Role page, select the Secure Application Manager check box and then select Windows version.
6. Click Save Changes to create the role and to display the role configuration tabs.

The General tab options (Restrictions (which includes Host Checker), VLAN/Source IP, Session Options, and UI Options) are all valid settings for a SAM role. See the Junos Pulse Secure Access Service Administration Guide for detailed information on each of these options.

We recommend that you use resource profiles to specify the applications available to users, but you can use role settings instead.

To specify applications for SAM to secure as part of a role:

1. Open the role you created for Pulse/SAM.
2. Click the SAM tab.
3. In the Applications section, click Add Application or select an existing application in the list and then click Add Duplicate.
4. In the Details section, select a type from the Type list, and then specify a name and description.

   If you select Custom to specify an application that is not included in the list, the Application Parameters section appears. Specify the following:
   - **Filename**—Specify the name of the file's executable file
• **Path**—Specify the file’s path

• **MD5 Hash**—Optionally specify the MD5 hash of the executable file. If you enter an MD5 hash value, Pulse verifies that the checksum value of the executable matches this value. If the values do not match, Pulse notifies the user that the identity of the application could not be verified and does not allow access.

If you select **Pick a Resource Profile**, and at least one application or destination has been configured as a Resource Profile SAM client application, a selection list appears and you can click a Resource Profile. Then, when you click **Save Application** or **Save + New**, the role is added to the profile’s list of roles, and the profile’s resource policies are updated. If there are no Resource Profile SAM client applications or destinations configured, this option is not available.

5. Click **Save Application** or **Save + New**.

To specify servers for SAM to secure as part of a role:

1. Open the role you created for Pulse/SAM.
2. Click the SAM tab.
3. In the Applications section, click **Add Server** or select an existing server in the list and then click **Add Duplicate**.

   If you select Standard, specify a name and a description, and then identify the server by name or IP address.

   If you select **Pick a Resource Profile**, a selection list appears and you can click a Resource Profile. Then, when you click **Save Application** or **Save + New**, the role is added to the profile’s list of roles, and the profile’s resource policies are updated.

4. Click **Save Application** or **Save + New**.

To specify options for the SAM role:

1. Open the role you created for Pulse/SAM.
2. Click the SAM tab.
3. Click **Options**.
4. Make sure **Windows SAM** is enabled, and then choose from the following:

   • **Secure Application Manager options**:
     
     • **Auto-launch Secure Application Manager**—If you enable this option, Pulse Secure Access Service automatically launches Secure Application Manager services when a user signs in through the Secure Access Service Web portal. If you do not select this option, users must manually start the Secure Application Manager from the Client Applications Sessions section of the Web portal.

     • **Auto-allow application servers**—If you enable this option, Pulse Secure Access Service automatically creates a SAM resource policy that allows access to the servers specified for the role in the SAM tab application and server lists.

   • **Windows SAM Options**:
- **Auto-uninstall Secure Application Manager**—This setting is not applicable to Pulse R3.0 or later. It applies to the previous WSAM client software only. If you enable it, it is ignored for connections that use Pulse R3.0 or later.

- **Prompt for username and password for intranet sites**—If you enable this option, the Pulse Secure Access Service requires users to enter sign-in credentials before connecting to sites on your internal network. This option changes Internet Explorer’s intranet zone setting so that Internet Explorer always prompts the user for network sign-in credentials for an intranet site.

- **Auto-upgrade Secure Application Manager**—This setting is not applicable to Pulse R3.0 or later. It applies to the previous WSAM client software only. If you enable it, it is ignored for connections that use Pulse R3.0 or later.

- **Resolve only host names with domain suffixes in the device DNS domains**—If you enable this option, users can only browse to Web sites that are part of their login domain.

- **Session start script and Session end scripts**—You can specify a script (.bat, .cmd, or .exe) to run on the users endpoint after Pulse connects and disconnects. For example, you can specify a script that maps network drives on an endpoint to shares on protected resources when the user connects. The script must be in a location (either local or on the network) that is accessible by the user.

5. Click **Save Changes**.

To use resource profiles to specify the applications available to Junos Pulse users:

1. Create resource profiles that enable access to client applications and destinations and configure the appropriate settings. Select **Users > Resource Profiles > SAM > Client Applications**.

2. Click **New Profile**.

3. From the Type list, select **WSAM**.

4. From the Application list, select one of the following options:
   - **Custom**—When you select this option, you must manually enter your custom application’s executable file name (such as telnet.exe). Additionally, you may specify this file’s path and MD5 hash of the executable file (although it is not required that you specify the exact path to the executable). If you enter an MD5 hash value, SAM verifies that the checksum value of the executable matches this value. If the values do not match, SAM notifies the user that the identity of the application could not be verified and does not forward connections from the application to the server.
   - **Lotus Notes**—Select this option to have SAM intermediate traffic from the Lotus Notes fat client application.
   - **Microsoft Outlook**—Select this option to have SAM intermediate traffic from the Microsoft Outlook application.
   - **NetBIOS file browsing**—Select this option to have SAM intercept NetBIOS name lookups in the TDI drivers on ports 137 and 139.
• **Citrix**—Select this option to have SAM intermediate traffic from Citrix applications.

• **Domain Authentication**—Select this option to allow integrated Windows applications, such as file sharing, Outlook, and so forth to authenticate to the domain controller when the client machine is part of a domain. Before using this option, you must:
  - Specify domain controllers that are reachable through the Pulse Secure Access Service in the WSAM Destination list so that LDAP and Kerberos traffic can be proxied and sent to the Pulse server.
  - Configure a WSAM Access Control Policy to allow access to all domain controllers.

**NOTE:** You can configure access to a standard application once per user role. For example, you can enable one configuration of Microsoft Outlook and one configuration of Lotus Notes for the “Users” role.

5. Enter a unique name and Optionally a description for the resource profile.

6. In the Autopolicy: SAM Access Control section create supporting auto policies and assign the policies to the role:
   a. If it is not already enabled, select the Autopolicy: SAM Access Control check box.
   b. In the Resource field, specify the application server to which this policy applies. You can specify the server as a host name or an IP/netmask pair. You may also include a port.
      If you select Domain Authentication from the Application list, enter your domain controller server addresses into the Resource field. You can add multiple domain controller servers if more than one is available.
   c. From the Action list, select Allow to enable access to the specified server or Deny to block access to the specified server.
   d. Click Add.

7. Click Save and Continue.

8. In the Roles tab, select the roles to which the resource profile applies and click Add.
   The selected roles inherit the autopolicy created by the resource profile. If it is not already enabled, the server also automatically enables the SAM option in the roles General > Overview page for all of the roles you select.

9. Click Save Changes.

10. Select Users > User Realms > New User Realm.

11. Specify a name and, optionally, a description and then click Save Changes to create the realm and to display the realm option tabs.

12. On the Role Mapping tab for the realm, create a new rule that maps all users to the role you created earlier in this procedure.
You can also use resource profiles to configure destination servers, network subnets and hosts and then add the resource profile to a role.

To use resource profiles to specify the network endpoints available to Junos Pulse users:

1. In the admin console, choose **Users > Resource Profiles > SAM > WSAM Destinations**.
2. Click **New Profile**.
3. Enter a unique name and optionally a description for the resource profile.
4. In the WSAM Destinations section, specify which servers you want to secure using WSAM and click **Add**. You can specify the servers as host name or IP/netmask pairs. You may also include a port.
5. Select the **Create an access control policy allowing SAM access to this server** check box (enabled by default) to enable access to the server specified in the previous step.
6. Click **Save and Continue**.
7. In the Roles tab, select the roles to which the resource profile applies and click **Add**.

The selected roles inherit the autopolicy created by the resource profile.

- Configuring Pulse Secure Access Service for Windows Mobile Endpoints on page 197

**Pulse Connection Set Options for Pulse Secure Access Service**

A Junos Pulse client connection set contains network options and allows you to configure specific connection policies for client access to any Pulse server. The following options are applied to each connection added to the connection set.

- **Allow saving logon information**—Controls whether the Save Settings check box is available in logon credential dialog boxes in the Junos Pulse client. If you clear this check box, the Junos Pulse client always requires users to provide credentials. If you select this check box, users have the option of saving their credentials.

The Junos Pulse client can retain **learned user settings**. These settings are retained securely on the endpoint, evolving as the user connects through different gateways and methods. The Junos Pulse client can save the following settings:

- Certificate acceptance
- Certificate selection
- Realm
- Username and password
- Proxy username/password
- Secondary username/password
- Role
NOTE: If the authentication server is an ACE server or a Radius server and authentication is set to Users authenticate using tokens or one-time passwords, Pulse ignores the Allow saving logon information option. If the user sees a username and token prompt and the Save Settings check box is disabled. Pulse supports soft token, hard token and smartcard authentication.

When a user opts to save settings, that information is used for each subsequent connection without prompting. If a setting changes, (for example, if a user changes a password), the saved setting is invalid and connection attempts fail. In this case, the user must use the client’s Forget Saved Settings feature. The Forget Saved Settings feature clears all user saved settings, and Junos Pulse prompts the user for required information on connection attempts.

- **Allow user connections**—Controls whether connections can be added by the user.
- **Display splash screen**—Clear this check box to hide the Pulse splash screen that normally appears when the Pulse client starts.
- **Dynamic certificate trust**—Determines whether or not users can opt to trust unknown certificates. If you enable this check box, a user can ignore warnings about invalid certificates and connect to the target Pulse server. See the Junos Pulse Access Control Service Administration Guide or the Junos Pulse Secure Access Service Administration Guide for complete information about setting up certificate-based authentication.
- **Dynamic connections**—Allows connections within this connection set to be automatically updated or added to a Junos Pulse client when the user connects to the Pulse server through the user Web portal. Dynamic connections are created as manual rather than automatic connections, which means that they are run only when the user initiates the connection or the user browses to a Pulse Server and launches Pulse from the server’s Web interface.
- **Wireless suppression**—Disables the endpoint’s wireless access when a wired connection is available. Wireless suppression occurs only when the wired connection is connected and authorized.

If the wired connection is removed, Pulse enables the wireless connections with the following properties:

- Connect even if the network is not broadcasting.
- Authenticate as computer when computer information is available.
- Connect when this network is in range.

NOTE: If you enable wireless suppression, be sure to also configure a connection that enables the client to connect through a wired connection.
Pulse Connection Configurable Options

When you create a connection for a connection set, you must choose a connection type. Table 4 on page 75 lists the options available for each connection type.

### Table 4: Pulse Connection Options

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use this connection type to define</strong></td>
<td><strong>Adapter type</strong>—Specifies the type of adapter to use for authentication: wired or wireless.</td>
</tr>
<tr>
<td><strong>configured connectivity to 802.1X</strong></td>
<td><strong>Outer username</strong>—Enables users to appear to log in anonymously while passing the actual login name (called the inner identity) through an encrypted tunnel. As a result, the user’s credentials are secure from eavesdropping and the user’s inner identity is protected. In general, enter anonymous, which is the default value. In some cases, you might need to add additional text. For example, if the outer identity is used to route the user’s authentication to the proper server, you might be required to use a format such as <a href="mailto:anonymous@acme.com">anonymous@acme.com</a>. <strong>NOTE:</strong> If you leave the box blank, the client passes the user’s login name (inner identity) as the outer identity.</td>
</tr>
<tr>
<td><strong>devices, wired or wireless. Users cannot</strong></td>
<td><strong>Scan list</strong>—If you selected wireless as the adapter type, the scan list box is available to specify the SSIDs to connect to in priority order. If you leave the list empty, the user can connect to any available wireless network.</td>
</tr>
<tr>
<td><strong>create 802.1X from the Pulse client interface. Users see 802.1X connections in the Pulse interface only when the connection has been deployed from the server and the specified network is available.</strong></td>
<td><strong>Support Non-broadcast SSID</strong>—Allow users to connect to a non-broadcast wireless network from within the Pulse interface.</td>
</tr>
<tr>
<td><strong>Specify the server certificate distinguished name (DN) and its signing certificate authority (CA). An empty DN field allows a client to accept any server certificate signed by the selected CA.</strong></td>
<td><strong>Trusted Server List for 802.1X Connection</strong></td>
</tr>
</tbody>
</table>
**Table 4: Pulse Connection Options (continued)**

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SSL VPN or UAC (L3) options</strong></td>
<td><strong>Allow user to override connection policy</strong>—Allows a user to override the connection policy by manually connecting or disconnecting. Typically, you leave this option selected to make sure that a user can establish a connection under all conditions. If you disable this check box, the user cannot change the endpoint’s connection status or shut down Junos Pulse.</td>
</tr>
<tr>
<td></td>
<td><strong>Support Remote Access (SSL VPN) or LAN Access (UAC) on this connection</strong>—This option specifies that the connection is used for network connectivity. This option must be selected if this connection is for Pulse Access Control Service. If the connection is for Pulse Secure Access Service, you can disable this check box and use the connection for accessing Pulse Collaboration meetings only by also selecting Enable Junos Pulse Collaboration integration on this connection.</td>
</tr>
<tr>
<td></td>
<td><strong>Enable Junos Pulse Collaboration integration on this connection</strong>—This option specifies that the connection is used for Pulse Collaboration Suite meetings. (Formerly called Secure Meeting.) This option must be disabled if this connection is for Pulse Access Control Service. If the connection is for Pulse Secure Access Service, you can enable this check box and use the connection for accessing Pulse Collaboration meetings. You can enable a connection for Pulse Secure Access Service to be used for remote access only, for Pulse Collaboration integration only, or for both remote access and Pulse Collaboration integration. If you do not select either option, an error occurs when you save changes to this connection.</td>
</tr>
<tr>
<td></td>
<td><strong>This server</strong>—Specifies that you want the endpoint to connect to this Pulse server. Clear this check box to enable the edit box of the <strong>URL</strong> field and specify a different Pulse server.</td>
</tr>
<tr>
<td></td>
<td><strong>URL</strong>—Allows you to specify a URL for a different Pulse server as the default connection. Specify a different server’s URL to create connections for other Pulse servers in your network.</td>
</tr>
<tr>
<td><strong>SRX options</strong></td>
<td><strong>Address</strong>—Specifies the location (host name or IP address) of the firewall.</td>
</tr>
<tr>
<td></td>
<td><strong>Allow user to override connection policy</strong>—Allows users to override the connection policy by manually connecting or disconnecting. Typically, you leave this option selected to make sure that a user can establish a connection under all conditions. If you disable this check box, the user cannot change the endpoint’s connection status or shut down Junos Pulse.</td>
</tr>
<tr>
<td><strong>App Acceleration options</strong></td>
<td><strong>Allow user to override connection policy</strong>—Allows a user to override the connection policy by manually connecting or disconnecting. Typically, you leave this option selected to make sure that a user can establish a connection under all conditions. If you disable this check box, the user cannot change the endpoint’s connection status or shut down Junos Pulse.</td>
</tr>
<tr>
<td></td>
<td><strong>NOTE:</strong> For connections that use application acceleration, if Kaspersky software is installed on the Pulse client endpoint, it must be configured to allow traffic on UDP port 3578.</td>
</tr>
<tr>
<td></td>
<td><strong>Community string</strong>—The Junos Pulse client and the Pulse Application Acceleration Service can form an adjacency only if they belong to the same community as identified by the community string. When you create a App Acceleration connection, be sure the community string for the connection matches the community string defined in the Pulse Application Acceleration Service.</td>
</tr>
</tbody>
</table>
Connection is Established Settings

For all connection types, you specify how the connection is established. The options vary according to the type of connection. These settings enable you to specify a connection as a machine authentication connection or a credential provider connection.

NOTE: A Pulse connection that is used for machine authentication has some special considerations. See “Junos Pulse Connection Realm and Role Preferences” on page 33 for more information.

The settings Connections can be established using the following options:

- **Manually by the user**—(All connection types.) When the endpoint is started, the Junos Pulse client software is started, but no connection is attempted. The user must use the Junos Pulse client user interface to select a connection.

- **Automatically after user signs into the desktop**—(All connection types.) When the endpoint is started and the user has logged in to the endpoint, the Junos Pulse client software connects automatically. For App Acceleration connections, automatically is the default because Pulse forms an adjacency with Pulse Application Acceleration Service automatically if the service is available.

NOTE: All connections on an endpoint that are configured to start automatically attempt to connect to their target networks at startup time. To avoid multiple connection attempts, be sure that only one connection is configured to start automatically or configure location awareness rules.

- **Automatically when the machine starts. Machine credentials used for authentication**—(SSL VPN or UAC (L3) connections only) Enables machine authentication, which requires that Active Directory is used as the authentication server and that machine credentials are configured in Active Directory.

NOTE: If the machine and user have different roles, each role should map to the same connection set. Otherwise after the user connects, the existing connection set might be replaced.

- **Automatically when the machine starts. Connection is authenticated again when the user signs in into the desktop**—(SSL VPN or UAC (L3) connections only) Enables machine authentication for the initial connection. After the user connects with user credentials, the machine authentication is dropped. When the user logs off, the machine authentication connection is restored.

- **Automatically during desktop authentication. User is presented with the Junos Pulse credential tile at the logon screen**—(SSL VPN or UAC (L3) connections only) This option enables Pulse client interaction with the credential provider software on the endpoint.
Location Awareness Rules

For SSL VPN or UAC (L3) and SRX connections that are set to have the connection established automatically, you can define location awareness rules that enable an endpoint to connect conditionally. For example, the endpoint connects to Pulse Secure Access Service if it is connected to the company intranet or it connects to Junos Pulse Secure Access Service if it is in a remote location.

According to location awareness rules—Location awareness rules enable an endpoint to connect conditionally. For example, the endpoint connects to Pulse Access Control Service if it is connected to the company intranet or it connects to Pulse Secure Access Service if it is in a remote location.

A Pulse connection uses the IP address of a specified interface on the endpoint to determine its network location. Each location awareness rule includes the following settings:

- **Name**—A descriptive name, for example, “corporate-DNS.” A name can include letters, numbers, hyphens, and underscores.
- **Action**—The method the connection uses to discover the IP address. Choose one of the following values:
  - **DNS Server**—Allows the endpoint to connect if the endpoint’s DNS server on the specified interface is set to one of the specified values. Use the condition box to specify IP addresses or address ranges.
  - **Resolve Address**—Allows the endpoint to connect if the hostname specified in the DNS Name box can be resolved by the DNS server for the specified interface. If one or more address ranges are specified in the Address Range box, the address must resolve to one of the ranges to satisfy the expression.
  - **Endpoint Address**—Allows the endpoint to connect if the IP address of the specified interface is within a range specified in the IP Address Range box.

- Creating a Client Connection Set for Pulse Secure Access Service on page 79

Securing the Connection State on the Junos Pulse Endpoint

To disable user interaction with Pulse connections on the endpoint, you can configure Junos Pulse connections so that when they are deployed to the endpoint, users cannot shut down a connection or shut down Pulse. Disabling user interaction with Pulse enables the Pulse administrator to control how endpoints connect to the network without allowing the user to override administrative control. For example, if you use machine authentication, the connection from endpoint to server is established automatically. By locking down the Pulse endpoint, users cannot change their connection.
To secure the Pulse endpoint from the Pulse Secure Access server:

1. Click Users > Junos Pulse Connections.
2. Edit or create a new connection.
3. Disable the check box labeled Allow user to override connection policy.
   This option is not available for UAC (802.1X) connections.

Creating a Client Connection Set for Pulse Secure Access Service

To create a Junos Pulse connection:

1. From the admin console, select Users > Junos Pulse > Connections.
2. Click New.
3. Enter a name and, optionally, a description for this connection set.
   
   NOTE: You must enter a connection set name before you can create connections.
4. Click Save Changes.
5. From the main Junos Pulse Connections page, select the connection set.
6. Under Options, select or clear the following check boxes:
   - Allow saving logon information—Controls whether the Save Settings check box is available in logon credential dialog boxes in the Junos Pulse client. If you clear this check box, the Junos Pulse client always requires users to provide credentials. If you select this check box, users have the option of saving their credentials.
   - Allow user connections—Controls whether connections can be added by the user through the Pulse client interface.
   - Display splash screen—Clear this check box to hide the Pulse splash screen that normally appears when the Pulse client starts.
   - Dynamic certificate trust—Determines whether or not users can opt to trust unknown certificates. If you select this check box, a user can ignore warnings about invalid certificates and connect to the target Pulse server.
   - Dynamic connections—Allows new connections to be added automatically to a Junos Pulse client when it encounters new Pulse servers through the Web browser.
   - Wireless suppression—Disables wireless access when a wired connection is available. Wireless suppression occurs only when the wired connection is connected and authorized.
7. Under Connections, click New to define a new connection.
8. Enter a name and, optionally, a description for this connection.
9. Select a type for the connection and then specify the connection. Type can be any of the following:

- **UAC (802.1X)**—Select this type if the connection establishes connectivity to an 802.1X wired or wireless device.
- **SSL VPN or UAC (L3)**—Select this type to define a connection for Pulse Secure Access Service or Pulse Access Control Service.
- **SRX**—Select this type to define a connection to an SRX Series Services Gateway.
- **App Acceleration**—Select this type to define a connection to the Pulse Application Acceleration Service.

The connection configuration options that appear depend on the connection type you select. For details on connection options see “Pulse Connection Configurable Options” on page 75.

For details on creating location awareness rules, see “Configuring Location Awareness Rules” on page 36.

10. After you have created the client connection set, create a client component set and select this connection set.

### Configuring Location Awareness Rules

The location awareness feature enables a Junos Pulse client to recognize its location and then make the correct connection when the connection is set to connect automatically. For example, a Pulse client that is started in a remote location automatically connects to Junos Pulse Secure Access Service. But that same client automatically connects to Pulse Access Control Service when it is started in the corporate office.

---

**NOTE:** Location awareness and session migration are similar because they both simplify connectivity for the user, but they do so under different conditions. With location awareness, the Pulse client makes a decision on where to connect when a user logs in to the computer. Session migration occurs when the user puts the computer into a stand by or hibernate mode without first logging off, and then opens the computer in a different network environment. Location awareness enables the Pulse client to intelligently start a new session. Session migration enables Pulse servers to intelligently migrate an existing session.

---

Location awareness relies on rules you define for each connection. If the conditions specified in the rules are true, Pulse attempts to make the connection. To set up the
location awareness rules that select among many connections, you must define location awareness rules for each connection. Each location awareness rule is based on the endpoint’s ability to reach an IP address or resolve a DNS name over a specified network interface.

NOTE: Location awareness behavior is affected by split tunneling configuration. For example, if a location awareness rule relies on a address resolution made on the physical adapter, and split tunneling is disabled, the rule always resolves to FALSE after Pulse establishes the connection.

The following location awareness example includes two connections. The first connection is a Pulse Access Control Service connection that resolves to TRUE when the endpoint is connected to the corporate LAN. The second connection is Junos Pulse Secure Access Service connection that resolves to TRUE when the endpoint is located in a remote location.

Pulse Access Control Service connection

If the DNS server that is reachable on the endpoint's physical network interface is one of your organization’s internal DNS servers, then establish the connection.

Pulse Secure Access Service connection

If the DNS server that is reachable on the endpoint's physical network interface is not one of your organization's internal DNS servers, and the DNS name of your Pulse Secure Access Service device resolves to the external facing IP address of the Pulse Secure Access Service device, then establish the connection.

NOTE: Connections can be set to manual, automatic, or controlled by location awareness rules. When the user logs in, the Pulse client attempts every connection in its connections list that is set to automatic or controlled by location awareness rules.

NOTE: To create a negative location awareness rule, you first create the positive state and then use rule requirement logic to use the rule as a negative condition.

To configure location awareness rules:

1. If you have not already done so, create a connection or open an existing connection. You can configure location awareness rules for Firewall connections and IC or SA connections. Location awareness rules do not apply to 802.1X or App Acceleration connections.

2. In the Connection is established area, select According to location awareness rules, and then click New.
3. Specify a name for the rule.

4. In the Action list, select one of the following:

   - **DNS server**—Connect if the DNS server associated with the endpoint’s network properties is (or is not) set to a certain value or set of values. Specify the DNS server IP address in the IP address box. Also specify a network interface on which the condition must be satisfied:
     - **Physical**—The condition must be satisfied on the physical interfaces on the endpoint.
     - **Junos Pulse**—The condition must be satisfied on the virtual interface that Junos Pulse creates when it establishes a connection.
     - **Any**—Use any interface.

   - **Resolve address**—Connect if the configured host name or set of host names is (or is not) resolvable by the endpoint to a particular IP address. Specify the host name in the DNS name box and the IP address or addresses in the IP address box. Also specify a network interface on which the condition must be satisfied.

   **NOTE:** The Pulse client software evaluates IP and DNS policies on network interface changes. DNS lookups occur on DNS configuration changes or when the time-to-live setting (10 minutes) expires for a particular host record. If Pulse cannot resolve the host for any reason, it polls the configured DNS server list every 30 seconds. If the host had been resolved successfully previously and the time-to-live timer has not expired, the polling continues until the timer expires. If the host had not been resolved successfully previously, the resolution attempt fails immediately.

   - **Endpoint Address**—Connect if a network adapter on the endpoint has an IP address that falls within or outside of a range or a set of ranges. Specify the IP address or addresses in the IP address box. Also specify a network interface on which the condition must be satisfied.

5. Click **Save Changes**.

After you create the rule or rules, you must enable each rule you want to use for the connection. To enable a negative form of a rule, use a custom version of the rule. To enable location awareness rules:

1. In the list of connection awareness rules for a connection, select the check box next to each rule you want to enable.

2. To specify how to enforce the selected location awareness rules, select one of the following options:
   - **All of the above rules**—The condition is TRUE and the connection is attempted only when all selected location awareness rules are satisfied.
• **Any of the above rules**—The condition is TRUE and the connection is attempted when any select location awareness rule is satisfied.

• **Custom**—The condition is TRUE and the connection is attempted only when all selected location awareness rules are satisfied according to the Boolean logic you specify in the Custom box. Use the Boolean condition to specify a negative location rule. For example, connect to Pulse Secure access service when Rule–1 is false and Rule–2 is true. The boolean logic in the custom box would be: **NOT Rule-1 AND Rule-2**. The accepted Boolean operators are AND, OR, NOT, and the use of ( ).

3. Click **Save Changes**.

• Junos Pulse Access Control Service Overview on page 20

**Junos Pulse Component Set Options for Pulse Secure Access Service**

A Junos Pulse component includes specific software components that provide Pulse connectivity and services.

A component set options includes the following options:

• **All components**—Includes all components. The Enhanced Endpoint Security (EES) component, which is available only if you have purchased an EES license, is included only if the user’s assigned role requires it. Use the **All components** option only when you want client endpoints to be able to connect to all supported Pulse servers and to be able to use application acceleration. When you include the App Acceleration component, the disk space requirement for the Junos Pulse client installation increases to 300 MB.

• **No components**—Select this option to create an installer that only updates existing Pulse client installations, for example, to add a new connection. Do not use this option if you are creating an installer to add Pulse to endpoints that do not already have Pulse installed.

• **Minimal components**—Includes only the components needed to support the selected connections. For example, if the connection set you create includes an IC or SA connection, the component set includes only the components required to connect to Pulse Access Control Service or Pulse Secure Access Service. The default is Minimal components, which provides all needed components for the selected connections and limits the size of the Junos Pulse installation file.

**NOTE:** Selecting Pulse components applies to a Web installation only. A preconfigured installer for a Windows endpoint always installs all components unless you specify the specific components you want using MSIEEXEC command options. A preconfigured installer for an OS X endpoint always installs all components.
Creating a Client Component Set for Pulse Secure Access Service

Client component options affect Web-based installations only. A preconfigured installer for a Windows endpoint always installs all components unless you specify the specific components you want using MSIEXEC command options. A preconfigured installer for an OS X endpoint always installs all components. To create a Pulse client component set:

1. From the admin console, select Users > Junos Pulse > Components.
2. Click New to create a new component set.
3. If you have not yet created a client connection set, select Users > Junos Pulse > Connections and create a new connection set. Or you can use the default client configuration, which permits dynamic connections, supports the outer username anonymous, and allows the client to automatically connect to Pulse Access Control Service or Pulse Secure Access Service.
4. Specify a name for the client component set.
5. (Optional) Enter a description for this client component set.
6. Select a connection set that you have created, or use the default connection set.
7. For Junos Pulse client components, select one of the following options:
   - All components—Includes all Junos Pulse components and supports all access methods and all features.
   - No components—Updates existing Pulse client configurations, for example, to add new connections. This option works on endpoints if they already have Pulse installed. Do not use this option if you are installing Pulse.
   - Minimal components—Includes only the components needed to support the selected connections. For example, if the connection set you create includes an IC or SA connection, the component set includes only the components required to connect to Pulse Access Control Service or Pulse Secure Access Service. The default is Minimal components, which provides all needed components for the selected connections and limits the size of the Junos Pulse installation file.

NOTE: Do not deploy Pulse with Minimal components and no connections. If you do so, the Pulse client is not able to connect to any devices and users are not able to create any connections from within the Pulse client interface.
NOTE: Selecting Pulse components applies to a Web installation only. A preconfigured installer for a Windows endpoint always installs all components unless you specify the specific components you want using MSIEEXEC command options. A preconfigured installer for an OS X endpoint always installs all components.

8. Click **Save Changes**.

9. After you create a component set, distribute the client to users through a role. When users access the role, the installer automatically downloads to the endpoint. The installer components and connections are applied to the endpoint client.

   If client connections associated with the component set for a role are changed even though the list of components has not, the existing configuration on the endpoint is replaced immediately if the endpoint is currently connected, or the next time the endpoint connects.

   If a user is assigned to multiple roles and the roles include different component sets, the first role in an endpoint’s list of roles is the one that determines which client (component set) is deployed.

**Endpoint Security Monitoring and Management for Pulse Secure Access Service**

You can configure and enable Host Checker policies to perform an endpoint security assessment before allowing the endpoint to connect. Host Checker is supported on the following operating systems:

- Windows
- Mac OS X
- Google Android
- Apple iOS
- Windows Mobile

You can invoke Host Checker at the role level or the realm level to specify access requirements for endpoints seeking authentication. Host Checker policies that are implemented at the realm level occur before the user is authenticated. Host Checker policies at the role level are implemented after authentication but before the user is permitted to access protected resources. When an endpoint first connects to Pulse Secure Access Service, the latest version of the IMC is downloaded to the host computer. The initial check can take 10-20 seconds to run. Outdated IMC files are automatically updated at subsequent checks.
NOTE: The first time an endpoint connects to Pulse Secure Access Service that has a patch assessment policy, if the connection is a Layer 2 connection, the IMC cannot download. In this case, you should configure a remediation role that displays instructions to direct the user to retry with a Layer 3 connection or to contact the administrator.

NOTE: If a realm has a Host Checker policy enabled that is for desktop clients, and a mobile device user employs a browser on the mobile device to connect to the Web portal, the login is denied because the desktop Host Checker program is not compatible with the mobile client OS. If Pulse mobile users are mapped to multiple roles, the login operation assigns them to a role where Host Checker is not enabled if possible. If all the roles have Host Checker enabled, the mobile users will not be allowed to login from the browser. You can create and enable Host Checker policies that are specific to each mobile operating system and then Host Checker runs when the Pulse client connects to the server.

For patch management on Windows systems, Host Checker uses a list of the most current patch versions from the vendor for predefined rules in the Host Checker policy. Host Checker does not scan for non-security patches. Server and Host Checker manage the flow of information between the corresponding pairs of TNC-based integrity measurement collectors (IMCs) and integrity measurement verifiers (IMVs). IMCs are software modules that run on the endpoint and collect information such as antivirus, antispyware, patch management, firewall, and other configuration and security information about the host. IMVs are software modules that run on the server and verify a particular aspect of a host’s integrity. Each IMV works with the corresponding IMC on the client endpoint to verify that the endpoint meets the Host Checker rules. IMCs scan the endpoint frequently for changes in security status. For example, if the user turns off virus checking, the IMC can detect this and then trigger a new check to make sure the modified system complies with the requirements of the Host Checker policy. You can configure Host Checker to monitor third-party IMCs installed on client computers by using third-party IMVs that are installed on a remote IMV server.

You obtain the most current patch version information from a Juniper staging site. You can manually download and import the list into the SA Series Appliance, or you can automatically import the list from the Juniper staging site or your own staging site at a specified interval.

Monitoring is based on one or more specified products or on specific patches, though not in the same policy. For example, you could check for Internet Explorer Version 7 with one policy, and Patch MS00-039: SSL Certificate Validation Vulnerabilities with a second policy. Then, apply both policies to endpoints at the role or realm level to ensure that the user has the latest browser version with a specific patch. In addition, for Microsoft products, you can specify the severity level of patches that you wish to ignore. For example, you could ignore low or moderate threats.
For complete information on configuring Host Checker policies, see the Junos Pulse Secure Access Service Administration Guide.

Remediation Options

Host Checker can identify issues on an endpoint. However, Host Checker and Pulse Secure Access Service cannot resolve issues, that is, perform remediation tasks, on non-compliant endpoints. To repair those issues Pulse Secure Access Service supports the following remediation options:

- **Instructions to the user**— server can send a message to the user describing the non-compliant patches or software and a link to where the user can obtain the required software. Figure 9 on page 87 shows a typical Pulse remediation message.

Figure 9: Pulse Remediation Instructions

- **Initiate SMS/SCCM remediation**— For remediation using Microsoft System Center Configuration Manager (ConfigMgr or SCCM), formerly Systems Management Server
(SMS), a pre-installed SMS/SCCM client on the endpoint is triggered by Host Checker to get patches from a preconfigured SMS/SCCM server. This mechanism installs only those patches that are published on the SMS/SCCM server.

- **Initiate Shavlik remediation**—SA Series SSL VPN Appliance software version 7.1 and later supports Shavlik remediation. After running Host Checker, if the endpoint requires remediation, the user can be prompted to install the required patches. You can configure remediation options to be launched automatically. The Shavlik patch deployment engine is downloaded to the endpoint. The engine links to the vendors’ patch repositories and installs the patches. Shavlik remediation is an optional licensed feature. **Figure 10 on page 89** shows the Pulse client screens that a user sees when the Pulse server is configured with Host Checker and Shavlik remediation.
Figure 10: Pulse Client Screens for Shavlik Patch Remediation
Issuing a Remediation Message with Pulse Secure Access Service

If a Host Checker policy finds that an endpoint is not in compliance, Host Checker can display a message through the Pulse client interface that includes custom instructions and reason strings on how to bring the endpoint into conformance. The user must perform the steps described in the message before the endpoint is allowed to access protected resources.

To enable a remediation message for a Host Checker policy:

1. In the admin console, select Authentication > Endpoint Security > Host Checker.
2. In the Policies section, click New to create a new Host Checker policy.
   For detailed information about Host Checker Rule Settings, see the Junos Pulse Secure Access Service Administration Guide.
3. As part of the Host Checker Policy, select Enable Custom Instructions.
   When you select this option, a text box appears. Enter the instructions to display to the user on the Host Checker remediation page. You can use the following HTML tags to format text and to add links to resources such as policy servers or web sites: <i>, <b>, <br>, <font>, and <a href>. For example:
   You do not have the latest signature files.
   <a href="www.company.com">Click here to download the latest signature files.</a>
4. Optionally, select Send reason strings. Select this option to display a message to users (called a reason string) that is returned by Host Checker or IMV and that explains why the client machine does not meet the Host Checker policy requirements. Reason strings describe to users what the IMV is checking on the client endpoint. This option applies to predefined rules, to custom rules, and to third-party IMVs that use extensions in the Juniper Networks TNC SDK.
5. Click Save Changes.

Be sure to include the Host Checker policy in the realm or role you configure for Pulse users.

Using SMS/SCCM Remediation with Pulse Secure Access Service

Junos Pulse supports the Microsoft System Center Configuration Manager (ConfigMgr or SCCM), formerly Systems Management Server (SMS) download method for patch
deployment. If Pulse Secure Access Service is configured for the SMS/SCCM method for patch deployment, the Pulse client endpoint must have the SMS/SCCM client already installed on the endpoint, otherwise remediation fails.

Endpoints configured with SMS/SCCM for software management typically poll the server for updates every fifteen minutes or longer. In a worst-case scenario, clients that are not in compliance with existing Host Checker software requirements might have to wait until the next update interval to login. Using the SMS/SCCM download method, you can force the client to initiate the software update immediately after the patch assessment check. If a user attempts to log in, and the endpoint does not have a required software version for compliance with a Host Checker patch assessment policy, Host Checker immediately notifies the client to poll the server for an immediate update. The client receives notification that an SMS/SCCM update has started.

To configure SMS/SCCM to update the client when notified, set the advertisement time on the SMS/SCCM to As soon as possible.

You assign clients to a particular group or collection on the SMS/SCCM server and then server can advertise patches for that collection. You can configure roles that correspond to collections and SMS/SCCM can send the appropriate patches for a particular role.

You must have the SMS/SCCM client installed and configured correctly on endpoints, and the SMS/SCCM server must be reachable. In a Layer 2 network, Host Checker is performed before the endpoint is connected to the network. Host Checker can obtain the IP address of the SMS/SCCM server configured for the client. If the endpoint is out of compliance and remediation is necessary, Host Checker pings the server IP address every 15 seconds until the server can be notified to update the client.

You should inform users of the expected behavior if this feature is enabled, as there is no notification to the user until the SMS/SCCM sends back the advertisement.

**NOTE:** Juniper Networks recommends only one patch deployment on an endpoint at any point in time. However, there is no way to determine if an SMS/SCCM update is in progress, and so it may be possible that the patch deployment engine is started while an SMS/SCCM Update is also occurring. (This scenario is possible if Pulse is connected to two devices with one using SMS/SCCM remediation and the other using the Shavlik patch deployment engine.) Most patches do not allow two instances to be running, so one of the remediation operations will fail.

The admin console allows you to select only one Host Checker patch remediation option (either SMS/SCCM or Shavlik) for all Host Checker policies.

If Pulse is connected to more than one Pulse server, and one uses SMS/SCCM remediation and the other uses Shavlik remediation, both requests are met. If both devices are configured to use Shavlik remediation, the requests are queued.
To enable SMS/SCCM assessment and remediation:

1. In the admin console, select **Authentication > Endpoint Security > Host Checker**.

2. In the **Policies** section, click **New** to create a new Host Checker policy.
   
   For detailed information about Host Checker Rule Settings, see the *Junos Pulse Secure Access Service Administration Guide*.

3. Under Patch Remediation Options, select **SMS/SCCM Patch Deployment**.

4. Click **Save Changes**.

Be sure to include the Host Checker policy in the realm or role you configure for Pulse users.

### Related Documentation

- Issuing a Remediation Message with Pulse Secure Access Service on page 90
- Using Shavlik Remediation with Pulse Secure Access Service on page 92

## Using Shavlik Remediation with Pulse Secure Access Service

Endpoints with Junos Pulse 2.0 or higher that are not in compliance with specified Host Checker patch policies can be updated with the required patches and brought into compliance automatically by the Shavlik patch deployment engine. The Host Checker IMC on the endpoint interfaces with the patch deployment engine to download and install missing patches reported by the IMV. Shavlik software runs on endpoints, downloads specified patches from vendors’ Web sites, and installs patches that are required through the Host Checker policy. Shavlik is an optional licensed feature.

**NOTE:** A separate license is required for Shavlik patch monitoring and deployment.

The Shavlik patch deployment engine is an executable file that is hosted on SA Series SSL VPN Appliance and then downloaded to endpoints as part of the Pulse deployment. During a remediation operation, the deployment engine downloads patches directly from vendor Web sites so Internet connectivity is needed for Shavlik remediation. The Shavlik patch deployment engine does not work with Layer 2 without Layer 3 connectivity.

All of the files required for patch assessment are a part of a Endpoint Security Assessment Plug-in (ESAP) from the Juniper Networks Customer Support Center ESAP packages beginning with SA Series SSL VPN Appliance software version 7.1. For information on how to update ESAP files, see the *Junos Pulse Secure Access Service Administration Guide*.

The IMC and IMV software for patch monitoring is backward compatible. Since this feature is available from Pulse Release 2.0 onward, a new Pulse communicating with an older IMV (with Pulse support), or a new IMV communicating to an older IMC exhibit the same behavior as today. There should be no change in the patch assessment, and the Shavlik deployment engine is not invoked for remediation.
NOTE: Juniper Networks recommends only one patch deployment operation on an endpoint at any point in time. However, there is no way to determine if an SMS/SCCM update is in progress, and so it may be possible that the patch deployment engine is started while an SMS/SCCM Update is also occurring. (This scenario is possible if Pulse is connected to two devices with one using SMS/SCCM remediation and the other using the Shavlik patch deployment engine.) Most patches do not allow two instances to be running, so one of the remediation operations will fail.

The admin console allows you to select only one Host Checker patch remediation option (either SMS/SCCM or Shavlik) for all Host Checker policies.

If the Pulse client is connected to two Pulse servers, and one uses SMS/SCCM remediation and the other uses Shavlik remediation, both requests are met. If both devices are configured to use Shavlik remediation, the requests are queued.

To enable SMS/SCCM assessment and remediation:

1. In the admin console, select **Authentication > Endpoint Security > Host Checker**.
2. In the **Policies** section, click **New** to create a new Host Checker policy.
   
   For detailed information about Host Checker Rule Settings, see the [Junos Pulse Secure Access Service Administration Guide](#).
3. Under Patch Remediation Options, select **Shavlik Patch Deployment**.
4. To allow users to decide whether to install patch updates, select **Prompt the user for consent before automatic patch deployment**.
   
   Deploying patches can take some time to complete. Some patches require a system reboot.
5. If you enable the user prompt for installing patches, select a default action. The default action runs automatically if the user does not respond to the prompt within 1 minute. Select one of the following default actions:
   
   - **Deploy patches**
   - **Do not deploy patches**
6. Click **Save Changes**.

**Enabling Enhanced Endpoint Security with Pulse Secure Access Service**

Host Checker includes integrated antispyware functionality that can detect and remediate Windows endpoints. Enhanced Endpoint Security (EES) ensures that malware, spyware, viruses, or worms are not present on endpoints that attempt to connect to Pulse Secure.
Access Service, and that you can restrict or quarantine these endpoints according to your Host Checker policy configuration. When EES is running on an endpoint, the Pulse interface displays a security pane that shows EES status.

NOTE: By default, the base license allows two simultaneous endpoints to use this feature. You can purchase a separate license to enable additional users.

EES scans processes on endpoints, monitors file system write and execution operations, and can automatically remediate machines that are not in compliance. EES reports threats that are detected but not remediated. In some cases the user might be directed to reboot the machine to achieve compliance.

EES uses a signature database that is automatically downloaded to endpoints from Web Root Spy Sweeper servers on the Internet. The signature database is not hosted on the Pulse server. Endpoints must have access to the Internet for EES to run successfully. Additionally, if you configure default remediation roles, ensure that endpoints that are directed to remediation roles that can access *.webroot.com.

You can configure Pulse Secure Access Service to determine the acceptable age of the signature database. The age of the database is the threshold used to determine whether a user can access resources by passing a Host Checker policy. For example, if signatures are 5 days old, and you configure the age as 3 days, the endpoint is allowed to access resources. If you configure the age as 4 days, the endpoint fails the Host Checker policy. Signature updates are performed regularly so endpoints should generally have the most current updates.

If Internet connectivity is not available to an endpoint before it connects to Pulse Secure Access Service, and you have chosen to implement the option to check for signature age, the policy does not pass if the signatures are too old. For example, if a user has not accessed the endpoint for several days and the signatures are not up to date, the endpoint cannot access Pulse Secure Access Service. To avoid this issue, you should create a default remediation role that allows limited access to the Internet for signature updates at *.webroot.com.

Any endpoint that is configured for an EES scan at Layer 2 always fails the check. To permit a network connection, you should configure the realm to reassign users to a remediation VLAN. This allows endpoint users to connect and download the required signature updates, or if connecting for the first time, the EES installer package.

You configure EES on the Endpoint Security > Host Checker main page to ensure that multiple policies are not created, and that the same policy is used across all realms and roles for which you have enabled it. When you create a realm or a role, you can enable EES restrictions in addition to any other Host Checker policies.
NOTE: If you configure an EES policy for endpoints, a separate EES installer (about 5 MB) is downloaded to endpoints on their first attempt to access resources protected by a Host Checker EES policy. User endpoints are scanned for offending software, and signatures are automatically installed.

User Experience

A significant amount of data is downloaded (approximately 5 MB for the installer and approximately 12 MB for the signatures), followed by the memory scan. After installation, signatures are updated and the memory scan is performed to verify that no spyware is loaded in memory. The download, update, and scan can take significant time to complete.

Any threat detected is automatically remediated by Host Checker and is not reported. If threats cannot be remediated, the endpoint reports back to the server. Roles and user sessions can be adjusted based on endpoint compliance. A number of user strings automatically notify the user of the compliance status.

To enable and use EES antispyware:

1. In the admin console, click Authentication > Endpoint Security > Host Checker.
2. Under Options, select the Advanced Endpoint Protection: Malware Protection tab.
4. To set the age of the signature definitions database, select the Signature definitions should not be older than check box. Enter the frequency in days (3 - 30). This number determines the maximum permissible age of signatures. It does not change the frequency of updates.
5. To enable an immediate EES scan in the background after allowing the network connection, select the Install EES and scan endpoints after network connection is established check box.
   Choose this option to allow an immediate connection before the scan takes place. This option allows users to connect and to begin work more quickly. However, this option is less secure because it allows network access before the endpoint has been scanned for malware.
6. Click Save Changes.

When you create or configure realm or role Host Checker restrictions, you can select Enhanced Endpoint Security: Malware Protection to apply to that role or realm.

Pushing Junos Pulse Configurations Between Pulse Servers of the Same Type

You can use the Push Configuration feature to centrally manage Junos Pulse connections, components, and uploaded Pulse packages. The Push Configuration feature enables you to copy all configuration settings or selected configuration settings from one Pulse server to another Pulse server of the same type, for example, from one SA Series SSL VPN Appliance to another SA Series SSL VPN Appliance to another.

This section describes how to use the Push Configuration feature to centrally manage Pulse. For complete details about using Push Configuration, see the appropriate administration guide.

The following notes apply to pushing configurations:

• You can push to a single Pulse server or to multiple Pulse servers in one operation. You can push up to 8 targets per push operation. You can run up to 25 push operations simultaneously. The maximum number of targets is 200. If a push to a target Pulse server fails, the operation proceeds to the next target until all identified targets are updated. The results page displays the status and any problems encountered during the process.

• You can push to a Pulse server that is a member of a cluster as long as the target Pulse server is not a member of the same cluster as the source.

• Target Pulse servers can refuse pushed configuration settings. The default is to accept.

• After an update, the target Pulse server restarts its services. Brief interruptions might occur while the service restarts. We recommend that you push to targets when they are idle or when you can accommodate brief interruptions.

• Target Pulse servers do not display a warning message when they receive a pushed configuration.

• The target Pulse server automatically logs out administrators during the push process.

• The source and target Pulse servers must have the same build version and number.

• The administrator account on the source Pulse server must sign in to the target Pulse server without any human intervention. For example, you cannot have dynamic credentials or multiple roles that are not merged as these both require manual interaction.

Before you use Push Configuration, you must configure your system according to the following conditions:

• You must map to the .Administrators role, thereby creating a “super administrator” with full administration privileges. Modify Authentication > Auth Servers > Administrator Server > Users settings to add yourself to the .Administrators role.

• The target Pulse server administrator account must use static password authentication or two-factor tokens that do not use challenge/response type authentication. For example, certificates, Soft ID, and Defender Authentication are not supported. Modify
Administrators > Admin Realms > [Administrator Realm] > General settings to select the proper authentication server for the administrator realm.

- Do not configure the administrator account in a way that requires the administrator to select a role to sign in to the target Pulse server. For example, do not map a single user to multiple roles, including the Push Configuration administrator role, and then fail to merge those roles. We recommend creating an account exclusively for Push Configuration administrators to guarantee that the administrator does not need to choose a role during the sign-in process and to clearly distinguish the actions of Push Configuration administrators in your log files. Use the Administrators > Admin Realms > [Administrator Realm] > Role Mapping settings to set the appropriate role-mapping rules.

To push Junos Pulse configurations from one Pulse server to other Pulse servers of the same type:

1. If you have not already done so, define the targets by selecting Maintenance > Push Config > Targets. For detailed procedures on how to define targets, see the appropriate administration guide.

2. From the admin console, select Maintenance > Push Config > Push Configuration.

3. In the What to push box, select Selected configuration to display the configuration categories.

4. Scroll down the list and expand the item labeled Junos Pulse.

5. Select the Select All Configurations check box to push all Junos Pulse configurations on this Pulse server. Or chose none, all, or selected items from the following categories:
   - Junos Pulse Connections—Connection sets and connections.
   - Junos Pulse Components—Component sets.
   - Junos Pulse Versions—Pulse packages that were uploaded to the Pulse server.

6. Add the targets to the Selected Targets box.

7. Click Push Configuration.

---

**Enabling or Disabling Automatic Pulse Upgrades**

After you deploy Junos Pulse client software to endpoints, software updates occur automatically. If you upgrade the Pulse client configuration on your Pulse server, updated software components are pushed to a client the next time it connects.

**NOTE:** When you configure Junos Pulse to make 802.1x based connections, a reboot may be required on Windows XP endpoints when Pulse is upgraded.
NOTE: A bound endpoint receives connection set options and connections from its binding server, but it can have its Pulse client software upgraded from any Pulse server that has the automatic upgrade option enabled. During a client software upgrade the client loses connectivity temporarily.

Pulse client software upgrades are enabled by default. To change the behavior of Pulse client upgrades:

1. From the admin console, select Maintenance > System > Options.
2. Set or clear the Enable automatic upgrade of Junos Pulse Clients check box.
3. Click Save Changes.

Related Documentation
• Upgrading Junos Pulse Software on page 55

Upgrading Junos Pulse Software

The software image for each supported Pulse server includes a Junos Pulse client software package. When a newer version of Pulse is available, you can upload the new software to the Pulse server. You can have more than one version of Pulse on a Pulse server but only one Pulse client package can be active. If you activate a new version of Pulse, and if the Pulse server's automatic upgrade option is enabled, connected Pulse clients display an upgrade prompt to the user. The user can choose to install the upgrade or cancel the operation. If a user cancels, the upgrade prompt appears each time the client connects to the server. During a client software upgrade the Pulse client loses connectivity temporarily.

NOTE: When you configure Junos Pulse to make 802.1x based connections, a reboot may be required on Windows XP endpoints when Pulse is upgraded.
After you have staged the new Pulse software package in a location accessible to the Pulse server, use the following procedure to upload the software to the Pulse server:

1. In the device admin console, select Users > Junos Pulse > Components.
2. In the section labeled Manage Junos Pulse Client Versions, click Browse, and then select the software package.
3. Click Upload.

Only one Junos Pulse software package can be active at a time. After you upload a new package, you need to enable it.

To enable a Pulse package as the default:

1. In the admin console, select Users > Junos Pulse > Components.
2. In the section labeled Manage Junos Pulse Client Versions, select the radio button next to a version, and then click Activate.

### Related Documentation
- Enabling or Disabling Automatic Pulse Upgrades on page 55

### Integrating iPass Open Mobile with Junos Pulse

Junos Pulse Release 2.1 and later supports select third-party software integration. iPass Open Mobile Platform provides reliable, secure and high-performance deployment of iPass enterprise mobility services. Together Pulse and iPass expand secure access options for Windows XP, Windows Vista, and Windows 7 endpoints. Third-party application integration is supported by Junos Pulse Secure Access Service.

iPass Enterprise Mobility Services provide authorized connectivity to public networks for Pulse users. The user can connect to Wi-Fi, Mobile Broadband, or dial networks from the
iPass Networks list when on the road. Once the Internet connection has been established, Junos Pulse provides a secure connection to the enterprise resources. iPass Enterprise Mobility Services provides authorized secure access to networks in restaurants, airports and in-flight Wi-Fi hot spots.

To enable application integration, you install an Advanced Connectivity license on the Pulse server. On the endpoint, the user must install iPass Open Mobile client software. The first time the user connects to the Pulse server where the advanced connectivity license is installed and enabled for the role, the license information is passed to the Pulse client, and then the iPass software is automatically integrated within the Pulse Connections pane. After integration, when the user is away from the corporate network, iPass automatically locates and enables connectivity to an authorized network. The user can then use Pulse to establish a VPN connection to the corporate network.

Integrating iPass and Pulse includes the following tasks:

- Install the Advanced Connectivity License on the SA Series SSL VPN Appliance.
- Enable third-party software integration for a role on the server where you installed the license.
- Each Pulse endpoint must install iPass Open Mobile. See your iPass representative for iPass client software.
- Each Pulse endpoint must connect to the role on the Pulse server that is enabled for third-party integration. This initial connection downloads the license information to the Pulse endpoint and enables the Pulse client for integration with iPass. If iPass is already installed on the Pulse endpoint, the iPass interface appears in the Pulse Connections pane a few moments after Pulse establishes the connection with the Pulse server.

To install the Advanced Connectivity license:

1. On the Pulse server, login as an administrator, and then click System > Configuration > Licensing.
2. Paste or type your license key into the License keys box and then click Add.

To enable third-party software integration for a role:

1. Click Users > User Roles > Role Name > Network Connect > Junos Pulse Settings.
2. Click the check box labeled Enable 3rd party connectivity integration.

   NOTE: The check box is present only after the Advanced Connectivity License has been installed on the system.

3. Click Save Changes.

Pulse Collaboration Suite Overview

Junos Pulse Collaboration Suite (formerly Secure Meeting) allows users to schedule and attend secure online meetings. In meetings, users can share their desktops and applications with one another over a secure connection. Meeting attendees can collaborate by enabling remote-control of their desktops and through text chatting. Users can schedule meetings through the Pulse Secure Access Service user Web portal or, if they have the Microsoft Outlook Plug-in installed, through Microsoft Outlook.

In addition to regular meetings, Pulse Collaboration Suite supports Instant Meetings and Support Meetings. Instant meetings allow you to create meetings with static URLs for that particular type of meeting (for example, weekly status meetings). You do not need to schedule these types of meetings. The conductor starts the meeting and the invitees enter the URL to attend the meeting.

You can enable Pulse Collaboration Suite integration as part of a Pulse connection and push the connection to Pulse clients through an installer package or a configuration update. The SSL VPN or UAC (L3) connection type includes a check box that enables Pulse Collaboration integration on the connection. When the check box is selected, Pulse clients that have installed that connection display new menu items that enable users to access Pulse Collaboration Suite functions. A connection that is enabled for meetings can serve as a normal SSL VPN connection or it can be dedicated to meetings only. When a Pulse user clicks the tray icon menu item for meetings, Pulse launches a browser window and connects to the server’s user Web portal.

Task Summary: Configuring Pulse Collaboration Suite on the Pulse Secure Access Server

The following summarizes how to enable a Pulse Secure Access server as a meeting server for Pulse Collaboration Suite meetings. For detailed procedures, see the Junos Pulse Secure Access Service Administration Guide.

To configure Pulse Collaboration Suite:

1. In the Pulse Secure Access server admin console, click System > Network > Overview and specify a network identity for the server. Pulse Collaboration Suite uses this host name when constructing meeting URLs for e-mail notifications.

2. Configure role-level settings:
   - To enable Pulse Collaboration Suite at the role level, click Users > User Roles > Role Name > General.
   - To configure role-level meeting restrictions, click Users > User Roles > Role Name > Meetings > Options.

3. Configure the authentication settings:
   - To specify the authentication servers meeting creators can access and search click Users > User Roles > Role Name > Meetings > Auth Servers.
   - To allow meeting creators to invite users from an LDAP server, click Authentication > Auth. Servers > Select LDAP Server > Meetings.
4. Configure meeting sign-in policies:
   - To customize the user Web portal pages that meeting attendees see when they sign into a meeting, click Authentication > Signing In > Sign-in Pages.
   - To define the URL that meeting participants use to join a meeting, click Authentication > Signing In > Sign-in Policies > Meeting Policy. You also use this page to associate a meeting page with the URL.
   - To associate your meeting sign-in policy with a user sign-in policy, click Authentication > Signing In > Sign-in Policies > User Policy. The Pulse Secure Access server applies the specified meeting URL to any meeting created by a user who signs into the associated user URL.

5. To configure system-level meeting settings, include session timeouts, SMTP server information, time zone settings, and color-depth settings, click System > Configuration > Pulse Collaboration Suite page of the admin console.

6. To enable client-side logging, click System > Log/Monitoring > Client Logs > Settings.

7. To view the logs that users push to the Pulse Secure Access server, click System > Log/Monitoring > Uploaded Logs.

**Configuring Pulse Connections to Support Meetings**

When you configure a Junos Pulse connection to support Pulse Collaboration Suite meetings, Pulse users on Windows endpoints can access meeting functions from the Junos Pulse tray icon. When the user clicks Start Meeting in the tray icon menu, Pulse launches a browser window that provides access to the meeting functions. The browser shows the Meetings page of the server’s user Web portal, which a user can also access by using a browser to login to the Pulse Secure Access server.

The tray icon for Pulse Collaboration Suite access is available when a Pulse connection is enabled as a meeting server connection. Pulse users cannot enable the meeting function for a connection. This task must be performed by the Pulse administrator on a connection defined on the server, and then installed on endpoints through normal methods of distributing and updating Pulse client software.

The following steps summarize how to create a Pulse connection that enables Pulse Collaboration Suite functions.

1. In a Pulse connection set, create a new Pulse connection or edit an existing connection set.
   - Pulse Collaboration Suite is available with SSL VPN connections (connection type SSL VPN or UAC (L3)) only.

2. Select the check box labeled Enable Junos Pulse Collaboration integration on this connection.

3. Distribute the connection to endpoints through normal methods of distributing and updating Pulse client software.
Scheduling Meetings Through the Pulse Secure Access Service User Web Portal

If you enable meeting creation abilities at the role level, users can create meetings through the Meetings page of the Pulse Secure Access Service user Web portal. The user scheduling the meeting must specify all of the standard meeting details such as the meeting name, description, start time, start date, recurrence pattern, duration, password, and a list of invitees. Additionally, the user must categorize all invitees into one of two categories:

- **Pulse Secure Access Service invitees**—A user who signs into the same Secure Access server or cluster as the meeting creator, also called an in-network invitee. When inviting an in-network user to a meeting, the meeting creator must specify the user’s username and authentication server.

- **Non-Pulse Secure Access Service invitees**—A user who signs into a different Secure Access server or cluster as the meeting creator, also called an out-of-network invitee. When inviting an out-of-network user to a meeting, the meeting creator must specify the user’s email address.

**NOTE:** If an in-network invitee uses the meeting URL instead of the Meetings page in the Pulse Secure Access Service user Web portal to join a meeting, Pulse Collaboration Suite classifies the user as an out-of-network invitee.

Scheduling Meetings Through Microsoft Outlook

If you enable meeting creation abilities at the role level, Pulse Secure Access Service users can create meetings through the Microsoft Outlook calendar using the Pulse Collaboration Suite Outlook plug-in.

When installing the Pulse Collaboration Suite plug-in on Microsoft Outlook 2000, the following message appears, “The form you are installing may contain macros.” Since the Pulse Collaboration Suite form does not contain macros it does not matter whether you click Disable Macros or Enable Macros.

**NOTE:** You must use the same Outlook profile to remove the Pulse Collaboration Suite plug-in as the one used to install the plug-in. Switching profiles between the installation and removal of the Plug-In is not supported.

To use this plug-in, the user must:

1. Install the plug-in from the Meetings page in the Pulse Secure Access Service user Web portal.
3. Use the Pulse Collaboration Suite tab to enter details about the Pulse Secure Access server on which the meeting should be scheduled as well as the user’s sign-in credentials, realm, and a meeting password.

   **NOTE:** Due to limitations with Microsoft Outlook, not all meeting details cross-populate between Microsoft Outlook and Pulse Secure Access Service. For a complete list of restrictions, see the Pulse Collaboration Suite for Outlook information available from the user help system available on the Pulse Secure Access Service user Web portal as well as the Pulse Collaboration Suite for Outlook plug-in installer.

4. Use the Scheduling and Appointment tabs to schedule the meeting and add invitees using standard Outlook functionality. Note that Pulse Collaboration Suite supports creating standard or recurring meetings through Outlook.

   **NOTE:** The Appointment tab has a check box labeled This is an online meeting using. This check box is not related to the Meeting Server or the Pulse Collaboration Suite Outlook Plug-in and cannot be used by a third-party plug-in.

5. Save the calendar entry to send the information to the Pulse Collaboration Suite server. Note that when saving a meeting, the user might see a certificate warning because the plug-in is communicating with a secure server.

6. Outlook sends invitation e-mails to the invitees using the text and meeting URL link constructed by the Pulse Collaboration Suite Outlook plug-in. Outlook also adds the meeting to the Outlook calendars of meeting invitees. This calendar item includes all of the standard information recorded by Outlook as well as an additional Pulse Collaboration Suite tab containing the information specified by the meeting creator in the Pulse Collaboration Suite tab. Note that the Pulse Secure Access server does not send an additional e-mail using the SMTP server.

7. To delete a meeting, click **Delete Meeting from Server** on the Pulse Collaboration Suite tab. Clicking Delete from the Outlook form does not delete the meeting.

CHAPTER 4

Configuring Junos Pulse on SRX Series Gateways

- Junos Pulse and SRX Series Gateways on page 105
- Dynamic VPN Configuration Overview on page 106

Junos Pulse and SRX Series Gateways

The dynamic virtual private network (VPN) feature of SRX Series gateways simplifies remote access by enabling users to establish Internet Protocol Security (IPsec) VPN tunnels without having to manually configure VPN settings on their endpoints. Junos Pulse supports dynamic VPN connectivity to SRX Series gateways. The VPN settings are part of a Pulse SRX connection. Depending on the version of Junos OS on the SRX gateway, you might be able to deploy Pulse to endpoints from the SRX Series gateway through a Web portal. A remote client accesses the Web portal and, after being authenticated, downloads and installs Pulse. The installation includes a Pulse connection to the SRX Series gateway. Alternatively, you can create and deploy firewall connections from Pulse Access Control Service and Pulse Secure Access Service. See the Junos Pulse Supported Platform Guide for details on the Junos OS versions that are able to deploy Pulse.

To configure a firewall access environment for Pulse clients, you must configure the VPN settings on the SRX Series gateway and create and deploy an SRX connection on the Junos Pulse client.

NOTE: Junos Pulse for mobile devices can access Pulse Secure Access Service only.

For SRX Series gateways that cannot deploy Junos Pulse client software, you have the following configuration and deployment options:

- In an environment that includes Pulse Secure Access Service and Pulse Access Control Service, create connections of the type SRX with a target address of your SRX Series Services gateway. Users could then install the Junos Pulse client software and the connection configurations by logging in to the Web portal of the Pulse Secure Access Service or Pulse Access Control Service and being assigned to a role that installs Junos
Pulse. After the installation, the endpoint has the Junos Pulse client software and the connection information required to connect to the SRX Series Services gateways.

- Install the default Junos Pulse software package, and then have users create new connections that point to the SRX Series gateway.

SRX Series gateways supported an earlier access client called Juniper Networks Access Manager. You must uninstall Access Manager before you deploy Junos Pulse to endpoints. The Pulse installation program checks for Access Manager. If Access Manager is present, the program displays a message instructing the user to uninstall Access Manager before installing Pulse.

Related Documentation
- Dynamic VPN Configuration Overview on page 106

Dynamic VPN Configuration Overview

A dynamic VPN allows administrators to provide IPsec access for Windows endpoints to a Pulse server on a Juniper Networks device.

The following procedure lists the tasks for configuring a dynamic VPN. For detailed information on these topics, see the JUNOS© Software documentation.

1. Configure authentication and address assignment for the remote clients:
   a. Configure an XAuth profile to authenticate users and assign addresses. You can use local authentication or an external RADIUS server. Use the `profile` configuration statement at the `[edit access]` hierarchy level to configure the XAuth profile.

      To use the XAuth profile for Web authentication, use the `web-authentication` configuration statement at the `[edit access firewall-authentication]` hierarchy level.

   b. Assign IP addresses from a local address pool if local authentication is used. Use the `address-assignment pool` configuration statement at the `[edit access]` hierarchy level. A subnet or a range of IP addresses can be specified. IP addresses for DNS and WINS servers may also be specified.

2. Configure the VPN tunnel:
   a. Configure the IKE policy. The mode must be aggressive. Basic, compatible, or standard proposal sets may be used. Only preshared keys are supported for phase 1 authentication. Use the `policy` configuration statement at the `[edit security ike]` hierarchy level.

   b. Configure the IKE gateway. Either shared or group IKE IDs can be used. You can configure the maximum number of simultaneous connections to the gateway. Use the `gateway` configuration statement at the `[edit security ike]` hierarchy level.

   c. Configure the IPsec VPN. Basic, compatible, or standard proposal sets may be specified with the `policy` configuration statement at the `[edit security ipsec]` hierarchy level. Use the `vpn` configuration statement at the `[edit security ipsec]` hierarchy level to configure the IPsec gateway and policy.
d. Configure a security policy to allow traffic from the remote clients to the IKE gateway. Use the `policy` configuration statement at the `[edit security policies from-zone zone to-zone zone]` hierarchy level.

**NOTE:** The placement of this security policy is important. You must place it above more specific, non-VPN policies so that traffic that is intended to be sent over the VPN tunnel is processed correctly.

e. Configure host inbound traffic to allow specific traffic to reach the device from systems that are connected to its interfaces. For example, IKE and HTTPS traffic must be allowed.

f. (Optional) If the client address pool belongs to a subnet that is directly connected to the device, the device would need to respond to ARP requests to addresses in the pool from other devices in the same zone. Use the `proxy-arp` configuration statement at the `[edit security nat]` hierarchy level. Specify the interface that directly connects the subnet to the device and the addresses in the pool.

3. Associate the dynamic VPN with remote clients:

a. Specify the access profile for use with dynamic VPN. Use the `access-profile` configuration statement at the `[edit security dynamic-vpn]` hierarchy level.

b. Configure the clients who can use the dynamic VPN. Specify protected resources (traffic to the protected resource travels through the specified dynamic VPN tunnel and is therefore protected by the firewall's security policies) or exceptions to the protected resources list (traffic that does not travel through the dynamic VPN tunnel and is sent in clear text). These options control the routes that are pushed to the client when the tunnel is up, therefore controlling the traffic that is send through the tunnel. Use the `clients` configuration statement at the `[edit security dynamic-vpn]` hierarchy level.

**Related Documentation**
- Junos Pulse Client Installation Overview on page 127
CHAPTER 5

Configuring Junos Pulse Application Acceleration Service

This chapter describes how to install and manage the Junos Pulse Application Acceleration Service.

- Installing the Junos Pulse Client on page 109
- Managing Software, Configurations, and Policies on page 112

Installing the Junos Pulse Client

Mobile and remote Windows users can obtain the benefits of application acceleration by installing the Junos Pulse client. The Junos Pulse client accelerates traffic between the client system and a remote Junos Pulse Application Acceleration Service gateway, provided the gateway is installed in the network path. The gateways and Pulse clients discover each other automatically and begin accelerating traffic without user intervention.

The Junos Pulse client can be installed from a Pulse Secure Access server or from a Pulse Application Acceleration server. Installing the Pulse client from the Pulse Secure Access server is recommended. The Pulse Secure Access server can be configured to download and install the Pulse client automatically when a user accesses the server.

NOTE: You must install the Junos Pulse client on each Windows client, not on a single Windows system that serves as a gateway for other clients.

The following sections describe how to install the Junos Pulse client:

- Configuring Personal Firewalls for Junos Pulse Acceleration on page 110
- Downloading the Junos Pulse Client from a Pulse Secure Access Server on page 110
- Downloading the Junos Pulse Client from a Pulse Application Acceleration Gateway on page 111
- Uninstalling the Junos Pulse Client on page 112
Configuring Personal Firewalls for Junos Pulse Acceleration

Personal firewalls can block connections (adjacencies) between the Pulse client and the Junos Pulse Application Acceleration Service gateway in the network path. The firewall must allow the connection software on the Pulse client (\texttt{WxConnectionMethod}) to receive inbound UDP packets on port 3578. The firewall policies can be changed in either of two ways:

- Administrators can create and distribute a firewall exception to users through a centrally managed firewall system.
- Users can modify the personal firewall on the client.

Some personal firewalls are updated automatically when the Pulse client is installed. Table 5 on page 110 summarizes the configuration required for several common firewall systems. The version number indicates the version that has been verified by Juniper Networks.

Table 5: Personal Firewall Exceptions for Pulse Acceleration

<table>
<thead>
<tr>
<th>Firewall Software Package and Version</th>
<th>Configuration Required to Permit Pulse Acceleration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trend Micro IS Pro 17.50</td>
<td>Add a new network control protocol to allow incoming UDP packets for all IP addresses on port 3578.</td>
</tr>
<tr>
<td>McAfee Personal Firewall 12.0</td>
<td>McAfee displays a message to the user when it detects the WX Connection Method service. Users should respond \texttt{Allow always}.</td>
</tr>
<tr>
<td>Norton 4.3.0.5</td>

<tr>
<td>Kaspersky 6.0</td>
<td>Edit the rules for applications to allow inbound UDP packets on port 3578.</td>
</tr>
<tr>
<td>Windows XP, Windows Vista, and Windows 7</td>
<td>No action required. Pulse updates the firewall during installation.</td>
</tr>
</tbody>
</table>

Downloading the Junos Pulse Client from a Pulse Secure Access Server

The Junos Pulse client can be downloaded and installed automatically when users access a Pulse Secure Access server. For version 6.5 or 6.3 SA Series gateways, the Junos Pulse client must first be exported from a Junos Pulse Application Acceleration Service gateway and uploaded to the Pulse Secure Access server (see “Distributing the Pulse Client” on page 115). Note that version 7.0 (or higher) Pulse Secure Access servers include the Junos Pulse client, so exporting the client is not necessary.

To download the Junos Pulse client from a Pulse Secure Access server:

1. On a computer running Windows 7, Windows Vista, or Windows XP, enter the URL of the Pulse Secure Access server in a supported Web browser. For example:

   \texttt{https://sa.juniper.net}

   The Loading Components page is displayed. The Host Checker window opens for downloading the Junos Pulse client installer, followed by the Junos Pulse Client window for downloading and installing the client. Note the following:
• If the Windows Firewall is enabled, click **Unblock** when prompted to allow the Junos Pulse client to accept external connections.

• If you are prompted to stop the Network Connect client, click **OK** and restart the Network Connect client after the Junos Pulse client is installed.

• If you are prompted about improper installation of the Host Checker or Junos Pulse client, click **Try Again** to complete the installation.

When installation is complete, the Junos Pulse client starts automatically. To start the client manually, double-click the Junos Pulse icon in the system tray. Application acceleration starts automatically when a remote Junos Pulse Application Acceleration Service gateway is discovered in the network path. No additional configuration is necessary.

### Downloading the Junos Pulse Client from a Pulse Application Acceleration Gateway

If you do not have a Pulse Secure Access server, you can download the Junos Pulse client from any Junos Pulse Application Acceleration Service gateway running JWOS 6.2. Before users can download the Pulse client software, you must:

- Verify that Pulse client downloads are enabled (see “Enabling Pulse Client Downloads” on page 112).

- Specify the Pulse client configuration (see Defining the Pulse Client Configuration).

To download the Pulse client to a computer running Windows 7, Windows Vista, or Windows XP:

1. If the WX Client is installed, uninstall the WX Client by selecting **Start > All Programs > Juniper Networks > WX Client > Uninstall**. The WX Client supports only JWOS 6.0 and is not compatible with the Pulse client.

2. Enter the following URL in a supported Web browser:

   `https://Gateway IP address/client`

3. Enter the username and password, if needed, and click **Login**.

4. Select **Install Now**, and, if necessary, click **Install** in the Security Warning dialog box. Note the following:

   - If the Windows Firewall is enabled, click **Unblock** when prompted to allow the client to accept external connections.

   - If you are prompted to stop the Network Connect client, click **OK** and restart the Network Connect client after the Junos Pulse client is installed.

When installation is complete, the Pulse client starts automatically, and the Pulse icon is shown in the system tray in the lower-right corner of the Windows desktop. Application acceleration starts automatically when a remote Junos Pulse Application Acceleration Service gateway is discovered in the network path. No additional configuration is necessary.
Uninstalling the Junos Pulse Client

To uninstall the Junos Pulse client software, select Start > All Programs > Juniper Networks > Junos Pulse > Uninstall, or run the following program (if necessary, change C: to the drive where Windows is installed):

C:\Program Files\Juniper Networks\Junos Pulse\Uninstall.exe

Managing Software, Configurations, and Policies

The following topics describe how to manage Pulse clients:

- Enabling Pulse Client Downloads on page 112
- Enabling Pulse Client Adjacencies on page 113
- Configuring Pulse Client Policies on page 113
- Viewing the Status of Pulse Clients on page 114
- Viewing the Pulse Client Configuration on page 114
- Uploading Pulse Client Software on page 114
- Distributing the Pulse Client on page 115

Enabling Pulse Client Downloads

Windows users can download and install the Junos Pulse client software from a Junos Pulse Application Acceleration Service gateway that has client downloads enabled. Optionally, you can require users to log in before they can download the client software.

To enable client software downloads:

2. Verify that the displayed version of the Pulse software is correct. If a later version is available, you must upload it to the gateway (see “Uploading Pulse Client Software” on page 114).
3. Select Allow Pulse software download to allow users to download the client software to a new remote client.
4. Select Allow Pulse software upgrade/downgrade to allow users to upgrade or downgrade their current version of the Pulse client. You may want to disable Pulse client upgrades and downgrades when:
   - You upgrade the gateway software and want only new users to install the new version of the Pulse client.
   - You downgrade the gateway and want to prevent users from installing an older version of the Pulse client (downgrading the gateway also downgrades the Pulse client loaded on the gateway).
5. Select Require user authentication to require users to log in, and specify the required username and password.
6. Click **Submit** to activate the changes.

7. Click **Save** in the taskbar to retain your changes after the next reboot.

### Enabling Pulse Client Adjacencies

By default, a Junos Pulse Application Acceleration Service gateway running JWOS 6.1 (or higher) can form an adjacency with any client that is running a supported version of the Junos Pulse client software. Traffic is accelerated after the adjacency is established. You can disable and enable client adjacencies at any time. After an adjacency is manually disabled (or disrupted for any reason), it takes about 30 seconds to reestablish the adjacency.

> **NOTE:** The new features in JWOS 6.2, such as NSC and Exchange acceleration, require version 2.1 (or later) of the Junos Pulse client.

To enable or disable adjacencies with Junos Pulse clients:

1. Select **Junos Pulse > Setup > Pulse Adjacency**.
2. Select **Allow adjacency with Pulse clients** to enable the gateway to form adjacencies with Junos Pulse clients. If you clear the check box, all current adjacencies are disabled, and all client traffic flows are reset.
3. Click **Submit** to activate the changes.
4. Click **Save** in the taskbar to retain your changes after the next reboot.

### Configuring Pulse Client Policies

Compression and acceleration services can be configured on a Junos Pulse Application Acceleration Service gateway for each client that is currently adjacent (connected) or that has been adjacent at any time since the last time the gateway was restarted. When an adjacency is established, the enabled services are applied to the traffic sent to that client.

To define the default configuration for a client, see Defining the Pulse Client Configuration.

To configure the Junos Pulse client policies:

1. Select **Junos Pulse > Policies**.
2. Enable a service for one or more clients by selecting the check box for the service next to the appropriate clients. To enable or disable a service for all clients, select or clear the **Select All/Clear** check box below the list.
3. Click **Submit** to activate the changes, or click **Reset** to discard them.
4. Click **Save** in the taskbar to retain your changes after the next reboot.
Viewing the Status of Pulse Clients

The Junos Pulse Application Acceleration Service gateways display the connection status of each Junos Pulse client and the status of each service between the local gateway and each Pulse client. The list of clients includes the adjacent (connected) clients and all clients that are waiting for a connection or have been active at any time since the last time the gateway was restarted. Inactive adjacencies are disconnected after 15 minutes.

To view the status of Junos Pulse clients:

1. Select Junos Pulse > Status.
2. Review the status icons:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![ ]</td>
<td>The Junos Pulse client is adjacent (connected).</td>
</tr>
<tr>
<td>![ ]</td>
<td>The Junos Pulse client is disconnected, waiting for a connection, or in the process of connecting or disconnecting.</td>
</tr>
<tr>
<td>![ ]</td>
<td>The service is operating normally.</td>
</tr>
<tr>
<td>![ ]</td>
<td>The service is not enabled on the local gateway. To enable the service, see “Configuring Pulse Client Policies” on page 113.</td>
</tr>
<tr>
<td>![ ]</td>
<td>A problem exists, or the service is enabled on the local gateway, but disabled on the Pulse client.</td>
</tr>
</tbody>
</table>

Viewing the Pulse Client Configuration

The default configuration that is downloaded to Junos Pulse clients can be viewed on a Junos Pulse Application Acceleration Service gateway. Note that when you generate the Pulse client configuration from the gateway, the client configuration contains a subset of the CLI commands from the gateway configuration.

To view the client configuration:

1. Click Junos Pulse > Admin > Display Pulse Configuration.
2. View the client configuration. For more information about the CLI commands in the configuration, see the Junos Pulse Application Acceleration Service Command Reference Guide.

Uploading Pulse Client Software

When a new version of the Junos Pulse client software becomes available, you must upload it to the Junos Pulse Application Acceleration Service gateway before it can be downloaded by users or exported for distribution. You can load the Pulse client software from a local disk or from an FTP or TFTP server.
To upload a new version of the Pulse client software:

1. Select Junos Pulse > Admin > Load Pulse Software.
2. Verify that you want to replace the client version displayed at the top of the page.
3. Select one of the following, and specify the location of the new Pulse version:

<table>
<thead>
<tr>
<th>Local disk</th>
<th>Specify the path and filename on a machine in your network, or click Browse and select the client software file.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TFTP server</td>
<td>Specify the path and filename on a TFTP server:</td>
</tr>
<tr>
<td>•</td>
<td>IP address of a TFTP server.</td>
</tr>
<tr>
<td>•</td>
<td>Path and filename of the software package on the server. The first character must be a slash (/).</td>
</tr>
<tr>
<td>FTP server</td>
<td>Specify the path and filename on an FTP server:</td>
</tr>
<tr>
<td>•</td>
<td>IP address of an FTP server.</td>
</tr>
<tr>
<td>•</td>
<td>Path and filename of the software package on the server. The first character must be a slash (/).</td>
</tr>
<tr>
<td>•</td>
<td>If the FTP server does not accept anonymous user access, enter a username and password for an account that has read/write privileges on the server.</td>
</tr>
</tbody>
</table>

4. Click Load to update the Junos Pulse client software.

Distributing the Pulse Client

In addition to allowing users to download the Junos Pulse client from a Junos Pulse Application Acceleration Service gateway, you can also distribute the client using either of the following methods:

• **Juniper Networks SA Series SSL VPN Appliance**—The Junos Pulse client can be downloaded and installed automatically when users access the Pulse Secure Access server. For version 6.5 or 6.3 SA Series gateways, you must export the Pulse client software package from a Junos Pulse Application Acceleration Service gateway, and then upload the package to the Pulse Secure Access server. Version 7.0 or higher Pulse Secure Access servers include the Pulse client, so exporting the client is not necessary. Junos Pulse configuration information for the Pulse Secure Access server is included in both the *Junos Pulse Administration Guide* and the *Junos Pulse Secure Access Service Administration Guide*.

• **Microsoft System Management Server (SMS)**—You can distribute the Junos Pulse client through SMS by exporting the client configuration for inclusion in the Windows installer file.

Distributing the Pulse Client Through an SA Series Gateway

Use the following procedure to distribute the Junos Pulse client through a version 6.5 or 6.3 SA Series gateway. To distribute the Pulse client through a version 7.0 or higher server, see the *Junos Pulse Administration Guide* or the *Junos Pulse Secure Access Service Administration Guide*. 

Copyright © 2012, Juniper Networks, Inc.
1. Load or generate a Junos Pulse client configuration (see Defining the Pulse Client Configuration).

2. Select Junos Pulse > Admin > Export Pulse Software.

3. Export the client software package to be installed on an SA Series gateway:
   a. Select Create Host Checker package for use with SA to have the Host Checker install and start the Junos Pulse client. If the client fails or is stopped manually, it is not restarted automatically.
   b. Click Export, click OK, and then save the .zip file to a local or network folder.

4. Upload the exported software package to an SA Series gateway:
   a. Log in as an administrator to the admin console of the SA Series gateway and select Authentication > Endpoint Security > Host Checker.
   b. Verify that the Perform check every X minutes and Client-side process, login inactivity timeout are set to 10 minutes or more, and that the timeout interval is not greater than the check interval.
   c. Select New 3rd Party Policy, specify a policy name, and select the exported Junos Pulse client software package as the Policies File.
   d. Click Save Changes.
   e. Select Users > User Realms > Select Realm > Authentication Policy > Host Checker. Select both the Evaluate Policies and Require and Enforce check boxes for the displayed Junos Pulse client policy.
   f. Click Save Changes to save the Host Checker policy.

Distributing the Pulse Client Through SMS

To use SMS to distribute the Junos Pulse client, you must export the client configuration from a Junos Pulse Application Acceleration Service gateway and use it to replace the default client configuration in the Windows installer file.

To distribute the Junos Pulse client through SMS:

1. Export the client configuration from the gateway:
   a. Select Junos Pulse > Admin > Export Pulse Software.
   b. Select Download Configuration for MSI package.
   c. Click Export, and then save the Config_All.ini file to a local or network folder.

2. Download the Windows installer version of the Junos Pulse client software (a .msi file) to a computer that has InstallShield 2008. You can download the software from http://www.juniper.net/customers/support.

3. Open the downloaded file with InstallShield, and select the Installation Designer tab.

4. Select Organization > Components in the left pane, and open the first components folder in the middle pane.
5. Select the Files subfolder in the middle pane, right-click the Config_All.ini file displayed in the right pane, and select Delete.

6. Right-click the Files subfolder, and select Add.

7. Locate the Config_All.ini file that you exported from the gateway, and click Open.

8. Select In a new CAB file file, select the Stream the new CAB file into the Windows Installer package check box, and click OK.

9. Click Save to save your changes.
CHAPTER 6

Session Migration

- Understanding Session Migration on page 119
- Task Summary: Configuring Session Migration on page 123
- Configuring Session Migration for the Pulse Client on page 123
- Configuring an IF-MAP Federated Network for Session Migration on page 124

Understanding Session Migration

This topic describes the session migration feature. It includes the following information:

- Session Migration Overview on page 119
- Session Migration and Session Timeout on page 121
- How Session Migration Works on page 121
- Session Migration and Session Lifetime on page 122
- Authentication Server Support on page 122

Session Migration Overview

When you enable session migration on two or more Pulse servers, a Pulse endpoint can migrate from one location to another and connect to a different Pulse server without providing additional authentication. For example, a user can be connected from home through a Pulse Secure Access server, and then arrive at work and connect to a Pulse Access Control server without being reauthenticated. If session migration is not enabled, Pulse users must be reauthenticated each time they attempt to access the network through a different Pulse server.

Sessions can be migrated between Pulse Access Control and Pulse Secure Access servers that are in the same IF-MAP federated network: using either the same IF-MAP server, or using IF-MAP servers that are replicas of one another.

The servers must be in the same authentication group. Authentication groups are configured through authentication realms. An authentication group is a string that you define for common usage. You can use authentication groups to group together realms with similar authentication methods. Such as, one authentication group for SecurID authentication, another authentication group for AD. A single gateway can belong to more than one authentication group, with a different authentication group per realm.
The Pulse server to which a user authenticates publishes session information to the IF-MAP server. Other IF-MAP clients in the federated network can use the information to permit access without additional authentication to users.

When a user session is migrated to another Pulse server, the new session information is pushed to the IF-MAP server. The IF-MAP server notifies the authenticating server, and information about the session that existed on the original server is removed leaving only session information about the current authenticating server on the IF-MAP server. The authenticating server removes information about the session from its local session table and the user license count is decremented.

When a session is migrated, realm role-mapping rules determine user access capabilities. You can import user attributes when a session is migrated, or you can configure a dedicated directory server to look up attributes for migrated user sessions. To ensure that session migration retains user sessions, configure a limited access remediation role that does not require a Host Checker policy. This role is necessary because the Host Checker timeout can be exceeded if an endpoint is in hibernation or asleep. With the new remediation role, the user’s session is maintained.

If additional Host Checker policies are configured on a role or realm to which a migrated session applies, the policies are performed before allowing the user to access the role or realm. Administrators of different Pulse servers should ensure that Host Checker policies are appropriately configured for endpoint compatibility.

Figure 12 on page 121 illustrates the task flow for enabling session migration for Pulse.
Figure 12: Requirements for Pulse Session Migration

Session Migration and Session Timeout

Session timeout on the authenticating server does not apply to a migrated session. Instead, session start time is applicable. The inbound server evaluates session timeout using the start time of the original session on the original server.

When a user reboots an endpoint for which session migration is enabled, the session is retained for a short time on the server. For sessions on the Pulse Access Control server, sessions are retained until the heartbeat timeout expires. For Pulse Secure Access server sessions, the idle timeout determines how long the session is retained.

If an endpoint that is connected to a Pulse Access Control server or Pulse Secure Access server is rebooted and the user does not sign out, when the endpoint is restarted and the user attempts to connect to the same access gateway, Pulse resumes the previous session without requesting user credentials if the previous session is still active.

How Session Migration Works

Session migration uses IF-MAP Federation to coordinate between servers.

When a session is established, the authenticating gateway publishes the session information, including a session identifier, to the IF-MAP server. The session identifier is also communicated to the Pulse client.
When the Pulse client connects to a migrating gateway in the same authentication group, the Pulse client sends the session identifier to the migrating gateway. The migrating gateway uses the session identifier to look up the session information in the IF-MAP server. If the session information is valid, the migrating gateway uses the session identifier to establish a local session for the endpoint that the Pulse client is running on.

The IF-MAP server notifies the authenticating gateway that the user session has migrated, and the authenticating gateway deletes the session information from the IF-MAP server.

**Session Migration and Session Lifetime**

Session migration is designed to give users maximum flexibility and mobility. Users are no longer tied to the office. The workplace can travel with the user, and electronic chores such as online banking can come to work. Because of this flexibility, users might be away from their machines for long periods of time, allowing their active session to expire. Session migration requires users to have an active session on the Pulse Access Control or Pulse Secure Access server.

You can adjust session lifetime to ensure that sessions do not time out while users are away from their machines. You adjust session lifetime on the gateway by selecting **Users > User Roles > Role Name > General > Session Options** in the admin console.

**Authentication Server Support**

The behavior of session migration depends to some extent on the authentication server on the inbound side.

The following list provides a summary of authentication server support:

- **Local authentication server**—Migration succeeds if the username is valid on the local authentication server.
- **LDAP server**—Migration succeeds if the LDAP authentication server can resolve the username to a distinguished name (DN).
- **NIS server**—Migration succeeds if the NIS authentication server can find the username on the NIS server.
- **ACE server**—Migration always succeeds.
- **RADIUS server**—Migration always succeeds. If you select **Lookup Attributes using Directory Server**, no attributes are present in the user context data.
- **Active Directory**—Migration always succeeds. The **Lookup Attributes using Directory Server** option may not work, depending on your configuration.
- **Anonymous**—No support for migrating sessions because sessions are not authenticated.
- **Siteminder**—No support for migrating sessions because Siteminder SSO is used instead.
- **Certificate**—No support for migrating sessions because sessions are authenticated using certificates.
- **SAML**—No support for migrating sessions because SAML SSO is used instead.
NOTE: For local, NIS, and LDAP authentication servers, the inbound username must reflect an existing account.

Task Summary: Configuring Session Migration

To permit session migration for users with the Pulse client, perform the following tasks:

1. Configure location awareness rules within a client connection set to specify locations included in the scope of session migration for users. For example, configure location awareness rules for a corporate Pulse Access Control server connection and a Pulse Secure Access server connection.

2. Configure an IF-MAP federated network, with the applicable Pulse Access Control servers and SA Series appliances as IF-MAP Federation clients of the same IF-MAP Federation server.

3. Ensure that user entries are configured on the authentication server for each gateway.

4. Ensure that user roles are configured for all users on each gateway.

5. Define a remediation role with no Host Checker policies to allow user sessions to be maintained when an endpoint is sleeping or hibernating.

6. Configure role-mapping rules that permit users to access resources on each gateway.

7. Enable and configure session migration from the User Realms page of the admin console.

8. Distribute the Pulse client to users.

Configuring Session Migration for the Pulse Client

NOTE: Ensure that all of the Pulse Access Control servers and Pulse Secure Access servers for which you want to enable session migration are IF-MAP Federation clients of the same IF-MAP Federation server. Additionally, make sure that each gateway is configured according to the procedures outlined in this section.
To configure session migration:

1. In the admin console, select Users > User Realms.
2. Select an existing realm, or create a new realm.
4. In the Authentication Group box, enter a string that is common to all of the gateways that provision session migration for users. The authentication group is used as an identifier.
5. Select for either the Use Attributes from IF-MAP option button or the Lookup Attributes using Directory Server option.

NOTE: Select Lookup Attributes using Directory Server only if you are using an LDAP server. Attributes are served faster with an LDAP server.

- Understanding Federated Deployments

Configuring an IF-MAP Federated Network for Session Migration

To successfully deploy session migration, you configure an IC Series device IF-MAP server, and you configure all of the connected IC Series devices and SA Series devices that users access as IF-MAP clients. A SA Series device can not be an IF-MAP server.

To add clients, you must specify the IP address and the security mechanism and credentials for the client.

An IF-MAP server certificate must be installed on the IF-MAP server. The client verifies the server certificate when it connects to the server. The server certificate must be signed by a Certificate Authority (CA), the client must be configured to trust certificates signed by that CA, and the hostname in the server certificate must match the hostname in the IF-MAP URL on the client.

You must identify the IF-MAP server to each IC Series device and SA Series device IF-MAP client. To add the server, you specify the IF-MAP URL of the server and how to authenticate to the server. Match the URL and security settings to equal those on the IF-MAP server to which the IF-MAP clients will connect.

To configure IF-MAP server settings on the IC Series device:

1. From the admin console select System > IF-MAP Federation > Overview.
2. On the IC Series device, under Choose whether this IC Series device runs an IF-MAP Server, an IF-MAP client, or no IF-MAP, select the IF-MAP Server option button.
3. Click **Save Changes**.

4. From the admin console select **System > IF-MAP Federation > This Server > Clients**.

5. Under IF-MAP Client, enter a **Name** and an optional **Description** for this client.
   
   For example, enter the name SA-access1.corporate.com and the description Secure Access 1.

6. Type one or more IP addresses of the client. If the client is multi-homed, for best results list all of its physical network interfaces. If the client is an IC Series device or Secure Access cluster, list the internal and external network interfaces of all nodes. It is necessary to enter all of the IP addresses for all of the interfaces because equipment failures may cause traffic between the IF-MAP client and the IF-MAP server to be re-routed through a different network interface. Listing all of the IP addresses maximizes the probability that IF-MAP Federation still works in the event of a failure.
   
   For example, enter 172.16.100.105.

7. Under Authentication, select the Client Authentication Method: **Basic** or **Certificate**.
   
   a. If you select **Basic**, enter a Username and Password. The same information should be added to the IF-MAP server.

   b. If you select **Certificate**, choose which Certificate Authority (CA) to use to verify the certificate for this client. Optionally, specify certificate attributes or restrictions to require values for certain client certificate attributes.

8. Click **Save Changes** to save the IF-MAP Client instance on the IF-MAP server.

To configure IF-MAP client settings on the IC Series device and SA Series device clients:

1. From the admin console select **System > IF-MAP Federation > Overview**.

2. In the IC Series device, under Choose whether this IC Series device runs an IF-MAP Server, an IF-MAP client, or no IF-MAP, select the **IF-MAP Client** option button. On the SA Series device, select **Enable IF-MAP Client** check box.

3. Type the server URL for IF-MAP Web service on the IF-MAP server. Append the server URL with `/dana-ws/soap/dsifmap` for all Juniper Networks IF-MAP servers.
   
   For example, https://access2.corporate.com/dana-ws/soap/dsifmap.

4. Select the client authentication method: **Basic** or **Certificate**.
   
   a. If you select **Basic**, enter a username and password. This is the same as the information that was entered on the IF-MAP server.

   b. If you select **Certificate**, select the device certificate to use.

   Ensure that the certificate of the CA that signed the IF-MAP server certificate is added from the System > Configuration > Certificates > Trusted Server CA page.

   The IF-MAP client validates the IF-MAP server certificate: if validation fails, the connection fails. Ensure that the hostname in the IF-MAP URL on the client machine matches the hostname of the server certificate on the IF-MAP server, and that the
CA that signed the server certificate is configured as a trusted server CA on the IF-MAP client.

5. Click **Save Changes**.

Junos Pulse Client Installation Overview

This section describes how to deploy Pulse for Windows and Pulse for Mac OS X client software from Pulse Access Control Service and Pulse Secure Access Service platforms. Pulse Application Acceleration Service supports deployment of App Acceleration connections only. See “Installing the Junos Pulse Client” on page 109 for information about how to deploy Pulse through Pulse Application Acceleration Service.

The Pulse server and Pulse Access Control Service include a default connection set and a default component set. These defaults enable you to deploy the Pulse client to users without creating new connection sets or component sets. The default settings for the client permit dynamic connections, install only the components required for the connection, and permit an automatic connection to Pulse Secure Access Service or Pulse Access Control Service to which the endpoint connects.

In all deployment scenarios, you must have already configured authentication settings, realms, and roles.

You can deploy the Junos Pulse client to endpoints from Pulse Secure Access Service and Pulse Access Control Service in the following ways:

- **Web install**—With a Web install, users log in to the Pulse server’s Web portal and are assigned to a role that supports a Pulse installation. When a user clicks the link to run Junos Pulse, the default installation program adds Pulse to the endpoint and adds the default component set and the default connection set. If you do not make any changes...
to the defaults, the endpoint receives a Pulse installation in which a connection to the
Pulse server is set to connect automatically. You can edit the default connection set
to add connections of other Pulse servers and change the default options.

NOTE: A Web install requires that the user have Java installed and enabled
for an installation through the Firefox browser or ActiveX enabled for an
installation through Internet Explorer. If the browser does not meet this
requirement, the user receives a descriptive message at the beginning of
the installation process.

• **Preconfigured installer**—Create the connections that an endpoint needs for connectivity
and services, download the settings file (.jnprpreconfig), and download default Pulse
installation program. For Windows endpoints you run the Pulse installation program
by using an msiexec command with the settings file as an option. For OS X endpoints,
you run the default installer and then import the .jnprpreconfig file using a separate
command.

• **Default installer**—You can download the default Pulse installation program and
distribute it to endpoints using your local organization’s standard software distribution
method (such as Microsoft SMS/SCCM). The Junos Pulse client software is installed
with all components and no connections. After users install a default Pulse installation,
they can add new connections manually through the Pulse client user interface or by
using a browser to access a Pulse server’s Web portal. For the latter, the Pulse server’s
dynamic connection is downloaded automatically and the new connection is added
to the Pulse client’s connections list. Dynamic connections are created as manual
rather than automatic connections, which means that they are run only when the user
initiates the connection or the user browses to a Pulse Server and launches Pulse from
the server’s Web interface.

If the Windows endpoints in your environment do not have admin privileges, you can use
the Juniper Installer Service program, which is available on the admin console System
Maintenance Installers page. The Juniper Installer Service allows users to download,
install, upgrade, and run client applications without administrator privileges. In order to
perform tasks that require administrator privileges, the Juniper Installer Service runs under
the client’s Local System account (a powerful account with full access to the system)
and registers itself with Windows’ Service Control Manager (SCM). An Active-X control
or a Java applet running inside the user’s Web browser communicates the details of the
installation processes to be performed through a secure channel between the Pulse
server and the client system.

When installing the Juniper Installer Service on client systems, note the following:

• When installing a Juniper client application on a user’s Windows system, the Juniper
Installer Service deploys two files on the client machine:
  • JuniperSetupSPIControl.ocx
  • AccessServiceComponent.exe
The device auto-starts this service when installing, and, then stops and removes it when uninstalling.

- Installing the Juniper Networks Installer MSI package requires administrator rights to install onto your client systems. If you plan to use the EXE version, administrator rights is not needed as long as a previous version of the access service component (deployed through, for example, JIS, Pulse, and so forth) is already present. If policies are defined for your client with the group policy “Run only Allowed Windows Application”, the following files must be allowed to run in the group policy. If not, client applications might not install.
  - dsmmf.exe
  - JuniperCompMgrInstaller.exe
  - JuniperSetupClient.exe
  - JuniperSetupClientOCX.exe
  - JuniperSetupXP.exe
  - uninstall.exe
  - x86_Microsoft.*.exe
- You should ensure that the Microsoft Windows Installer exists on the client system prior to installing the Juniper Installer Service.
- Your end-users’ client systems must contain either a valid and enabled Java Runtime Engine (JRE) or a current SA Series Appliance ActiveX control. If the client systems do not contain either of these software components, the users will be unable to connect to the gateway. If there is no JRE on your end-users’ client systems, you should download an appropriate installer package from Maintenance > System > Installers. The service appears in the Windows Services (Local) list as Neoteris Setup Service. The service starts automatically on install and during client system start up.

Adding a Pulse Configuration to a New Pulse installation

When you install the Pulse client software on an endpoint using the default Pulse installer, the endpoint has all of the software it needs to connect to Pulse servers. However, the Pulse client needs a configuration that identifies the Pulse servers it can connect to, that is, the connections. Connection properties include how the connections are to be started, manually, automatically, or according to location awareness rules. The configuration also defines how Pulse and the connections behave (the connection set properties, also called machine settings). Figure 13 on page 130 shows the default Pulse connection set properties, which are passed to the Pulse client as its configuration. Figure 14 on page 131 shows the connection set properties as they appear in a Pulse preconfiguration file, which you can use to add the Pulse configuration when you install Pulse.

There are two methods to install an initial configuration on a new Pulse client:

- Use a Pulse preconfiguration file (.jnprpreconfig) when you install Pulse on endpoints using the default Pulse installer.
- Instruct users to open a browser and login to the Pulse server Web portal.

The first time a Pulse client connects to a server that offers a Pulse configuration, the configuration settings are installed on the client and the client is bound to that server, which means that only that server can update the client’s configuration. Any Pulse server can update the Pulse client software version if that feature is enabled, and any Pulse server can add a connection to an existing Pulse client configuration if the dynamic connection property is enabled. But only the binding server can update the Pulse client’s configuration.

The dynamic connection enables a new Pulse connection to be added to an existing Pulse client when the user connects through the Web portal of a Pulse server. For example, a user has a Pulse connection to PulseServerA (the binding server) and it’s Pulse configuration allows dynamic connections. If the user browses to PulseServerB and successfully authenticates through the server’s Web portal, the server adds a
PulseServerB connection to the Pulse client configuration. This new connection is set to start manually so that it does not attempt to connect when the endpoint is restarted.

You can see a Pulse configuration by creating and viewing a .jnprpreconfig file. (To create the file, go to the Pulse Component screen, select a component set, and then click the Download Pulse Configuration button.) The .jnprpreconfig file contains a section that defines the machine settings and separate sections for each Pulse connection deployed to the client as shown in Figure 14 on page 131.

```

The machine settings and each centrally configured connection (as opposed to connections created by users or added as a dynamic connection) include the server-id of the binding server. When a user browses to a Pulse server, and the server offers a new configuration, the client ignores it unless the server-id in the new configuration matches the server-id of the Pulse client's configuration.
Configuration files have a version number as well. When a Pulse client connects to its
binding server, Pulse compares the version of its existing configuration to the version on
the server. If the server version is greater than the existing client version, the client
configuration is updated. The update might add, change, or remove connections and
change machine settings.

If you have several Pulse servers and you want to provision the same configuration from
all of the servers, the server-id of the Pulse configuration must be the same across all of
the servers. To accomplish this, you create the configuration on one server, and then use
the "push config" feature of the Pulse server to push the configuration to the other Pulse
servers. This method ensures that the server-id of the configuration file is the same across
all of the Pulse servers so that clients can receive a configuration update from any of the
Pulse servers.

- Introducing Junos Pulse on page 3

Installing the Junos Pulse Client from the Web

For a Web install, you direct users to the Web interface of the Pulse server. After a
successful login, a user is assigned to a role that includes an automatic download and
installation of the Pulse client software.

NOTE: A Web install requires that the user have Java installed and enabled
for an installation through the Firefox browser or ActiveX enabled for an
installation through Internet Explorer. If the browser does not meet this
requirement, the user receives a descriptive message at the beginning of the
installation process.

The default Junos Pulse installation settings includes minimal components and a
connection to the Pulse server. If you want a Web install that has customized settings,
you can do any of the following:

- Edit the default connection set and add new connections. The default installer uses
  the default component set which includes the default connection set.

- Create a new connection set and edit the default component set to include the new
  connection set.

- Edit the role to specify a component set that includes the connections you want for
  the default installation.

NOTE: A Pulse installation causes a restart of active network connections
on a Windows endpoint. When a user initiates a Pulse installation through a
WAN connection to the Web interface of a Pulse server, the user might need
to log in to their service provider again to reestablish network connectivity.
Users need to be aware of this issue before they begin the installation.
Launching Junos Pulse from the Pulse Server Web Portal

One typical method of establishing a VPN connection is for users to browse to the Pulse server’s Web portal, login, and then launch Pulse from the Web page. (This method is common in environments that used the Network Connect client.)

The following items describe the Pulse connection behaviors:

• The Pulse client has been installed on the endpoint by using the default Pulse installer. The installed Pulse client does not yet have any connections. The user browses to the Pulse server, logs into the server, and then clicks the Pulse button on the Web portal page. The following action occurs:
  1. The default Pulse connection set is automatically deployed to the client.
  2. The connection that has a URL that matches the server URL is launched.

• The Pulse client has been installed on the endpoint and it has a connection from the Pulse server. The user browses to the Pulse server, logs into the server, and then clicks the Pulse button on the Web portal page. The following action occurs:
  1. The connection that has a URL that matches the server URL is launched.

• Pulse has been installed on the endpoint and it has a connection from two different Pulse servers. The user browses to one of these Pulse servers, logs into the server, and then clicks the Pulse button on the Web portal page. The following action occurs:
  1. Only the connection that has a URL that matches the server URL is launched.

• Pulse has been installed on the endpoint. It has a connection for one Pulse server but the user browses to a different Pulse server, logs into the server, and then clicks the Pulse button on the Web portal page. The following action occurs:
  1. A new dynamic connection is created on the Pulse client for this Pulse server. (Note that the default connection on the server must be configured as a dynamic connection.) This new connection is a manual connection, that is, it does not start automatically when Pulse starts.
  2. The new connection for this Pulse server is started based on matching URLs.

Usage Notes

The Web browser method of launching Pulse is affected by the following configuration issues:

• The Pulse connection URL and the server URL must be an exact match. Pulse does not perform reverse DNS lookup to find a match.

• Connections that have the connection property Allow user to override connection policy disabled cannot be launched from the browser even if URLs match.
Installing the Junos Pulse Client on Windows Endpoints Using a Preconfiguration File

The following procedures apply to Windows installations only.

After you create client connection sets and specify the connections to include within a client component set, you can create a preconfiguration file with all of the connections you want to distribute with the Pulse client. You specify the preconfiguration file as an option when you run the Pulse .msi installer program using an msiexec (windows\system32\msiexec.exe) command.

**NOTE:** The preconfigured installer always installs all components unless you specify the specific components you want using ADDLOCAL command line options. The components installed by a preconfigured installer are determined by ADDLOCAL options and not by the component set you select when you create the preconfiguration file.

**NOTE:** When you run msiexec, you should append /qn or /qb (msiexec command line options) to the command line to suppress the installation program user interface. For example, the user interface lets the user choose a complete installation or a custom installation, which can override the components you specify with ADDLOCAL options. If the user selects Complete, the msiexec programs ignores the ADDLOCAL options in the command line and installs all components. The /qn option specifies a silent install, no user interface appears. The /qb option also hides the user interface but it displays a progress bar.

**NOTE:** The preconfigured installer works with Windows installations only.

To create a preconfigured Pulse installer for distribution to Windows endpoints:

1. Select Users > Junos Pulse > Connections and create a connection set with the connections that you want to distribute.
2. Select Users > Junos Pulse > Components.
3. If necessary, create a new component set with the connection sets you want to distribute.
It does not matter which component option you select, **All components, No components, or Minimal components**. You can specify the specific components to install in the msiexec command line.

4. Select the check boxes next to the component sets that you want to distribute.

5. Click **Download Installer Configuration**.

You are prompted to save the preconfiguration. You can also specify the name of the target Pulse server for the connections, which enables you to create configuration files that are the same except for the target server.

The default file name of the .jnprpreconfig file is the name of the selected component set. Make note of the file name and location where you put the file. The preconfiguration file must be available to the clients either through a network share or distributed along with the Junos Pulse .msi installer file.

6. Select **Maintenance > System > Installers**.

If necessary for your environment, download and install the Juniper Installer Service. To install Pulse, users must have appropriate privileges. The Juniper Installer Service allows you to bypass privilege restrictions and allow users with limited privileges to install Pulse.

7. Download the appropriate Junos Pulse installer for your Windows environment:

- Junos Pulse Installer (32-bit)
- Junos Pulse Installer (64-bit)

### Installing the Pulse Client Using Advanced Command Line Options

The Junos Pulse installer includes the Pulse client and all of the software components for all of the Pulse services. The preconfiguration file contains the definitions of the Pulse connections that provide client access to specific Pulse servers and services.

You run the Pulse preconfigured installer program with msiexec (the command line for launching .msi programs on Windows platforms) and specify the following options.

**NOTE:** Command line options (CONFIGFILE and ADDLOCAL) are case sensitive and must be all caps.

- **CONFIGFILE**—This property specifies a configuration file to be imported into Pulse during installation. The property must include the full path to the configuration file. For example:

  \[
  \text{msiexec -i JunosPulse.msi CONFIGFILE=c:\temp\myconfiguration.jnprpreconfig}
  \]

- **ADDLOCAL**—This property specifies which features and feature options (sub-features) to install when you want to install only specific Pulse features. If you do not specify ADDLOCAL options, all Pulse components are installed. A feature comprises the components required to support client connections. When you use ADDLOCAL, you
should append msiexec options /qn or /qb to the command line to suppress the installation program user interface.

Feature and sub-feature names are case sensitive. To specify multiple features in a single command, separate each feature with a comma.

ADDLOCAL features:

• PulseSA—Pulse components required for Pulse Secure Access Service.
• PulseUAC—Pulse components required for Pulse Access Control Service.
• PulseSRX—Pulse components required for SRX Series Gateways.
• PulseAppAccel—Pulse components required for Pulse Application Acceleration Service.

Optional sub-features:

• Pulse8021x—Available with PulseUAC. Includes 802.1x connectivity components.
• SAHostChecker—Available with PulseSA. Includes Host Checker components for connections to Pulse Secure Access Service.
• UACEndpointDefense—Available with PulseUAC. Includes Enhanced Endpoint Security components for connections to Pulse Access Control Service.
• UACHostChecker—Available with PulseUAC. Includes Host Checker components for connections to Pulse Access Control Service.
• UACIPSec—Available with PulseUAC. Includes components required to connect to Pulse Access Control Service using IPSec from 32-bit Windows endpoints. This feature is available in the 32-bit MSI only.
• UACIPSec64—Available with PulseUAC. Includes components required to connect to Pulse Access Control Service using IPSec from 64-bit Windows endpoints. This feature is available in the 64-bit MSI only.

Examples

When you use ADDLOCAL, you should append msiexec options /qn or /qb to the command line to suppress the installation program user interface. These examples use /qb.

To install PulseUAC with 802.1x and Enhanced Endpoint Security support on a Windows 32-bit endpoint using a configuration file, use the following command line:

```msiexec -i JunosPulse.x86.msi CONFIGFILE=c:\pulse\Pulse-Connection-no.jnprpreconfig ADDLOCAL=PulseUAC,Pulse8021x,UACEndpointDefense /qb```
To install PulseSA on a 32-bit Windows endpoint using a configuration file, use the following command line:

`msiexec -i JunosPulse.x86.msi CONFIGFILE=c:\temp\myconfiguration.jnprreconfig ADDLOCAL=PulseSA /qb`

To install PulseSA with Enhanced Endpoint Security and Host Checker on a 64-bit Windows endpoint using a configuration file, use the following command line:

`msiexec -i JunosPulse.x64.msi CONFIGFILE=c:\temp\myconfiguration.jnprreconfig ADDLOCAL=PulseSA,SAEndpointDefense,SAHostChecker /qb`

To install PulseAppAccel on a 64-bit Windows endpoint using a configuration file, use the following command line:

`msiexec -i JunosPulse.x64.msi CONFIGFILE=c:\temp\myconfiguration.jnprreconfig ADDLOCAL=PulseAppAccel /qb`

To install all Pulse components on a 64-bit Windows endpoint using a configuration file, use the following command line:

`msiexec -i JunosPulse.x64.msi CONFIGFILE=c:\temp\myconfiguration.jnprreconfig /qb`

### Repairing a Pulse Installation on a Windows Endpoint

Junos Pulse uses an MSI installer, which supports a repair function. If problems with Pulse on a Windows endpoint indicate missing or damaged files or registry settings, the user can easily run the installation repair program. The repair program performs a reinstallation and replaces any missing files. The repair program does not install any files that were not part of the original installation. For example, if the file that holds Pulse connection configurations is damaged, the file installed by the repair program does not replace any Pulse connections that were created by the user or deployed to the endpoint after the original Pulse installation.

To repair a Pulse installation on a Windows endpoint:

1. On the Windows endpoint where Pulse is installed, click **Start > Programs > Juniper Networks > Junos Pulse > Repair Junos Pulse.**
2. Follow the prompts for the installation wizard.
   
   When the program is finished, you might be prompted to reboot the system.

### Related Documentation

Installing the Junos Pulse Client on OS X Endpoints Using a Preconfiguration File

The following procedures apply to OS X installations only.

After you create client connection sets and specify the connections to include within a client component set, you can create a preconfiguration file with all of the connections you want to distribute with the Pulse client. After you run the Pulse installer on the endpoint, you run a special command that imports the settings from the preconfiguration file into Pulse.

To create a preconfigured Pulse installer for distribution to OS X endpoints:

1. Select Users > Junos Pulse > Connections and create a connection set with the connections that you want to distribute.
2. Select Users > Junos Pulse > Components.
3. If necessary, create a new component set with the connection sets you want to distribute.
   - It does not matter which component option you select, All components, No components, or Minimal components. The Pulse installation program for OS X always installs all components.
4. Select the check boxes next to the component sets that you want to distribute.
5. Click Download Installer Configuration.
   - You are prompted to save the preconfiguration. You can also specify the name of the target Pulse server for the connections, which enables you to quickly create multiple configurations that are the same except for the target server.
   - The default file name of the .jnprpreconfig file is the name of the selected component set. Make note of the file name and location where you put the file. The preconfiguration file must be available to the clients either through a network share or distributed along with the Junos Pulse installer file.
7. Download the Junos Pulse installer, Junos Pulse Installer (Macintosh).

Installing the Pulse Client on OS X Endpoints Using Command Line Options

The Junos Pulse installer includes the Pulse client and all of the software components for all of the Pulse services. The preconfiguration (.jnprpreconfig) file contains the definitions of the Pulse connections that provide client access to specific Pulse servers and services. After you distribute the Pulse installation package, you must first run the installer, and then run a separate program called jamCommand, which imports the settings from the .jnprpreconfig file. The jamCommand program is part of the Pulse installation.

The Pulse file you download from the Pulse server is in compressed (.dmg) format. You must unpack the file before you run the Pulse installation program.
The following steps include sample commands to install Pulse on an OS X endpoint and then import Pulse connections from a .jnprpreconfig file.

1. Run the Pulse installation program:
   
   ```
   ```
   
2. Import the settings from the .jnprpreconfig file by running this command
   
   ```
   /Applications/Junos\Pulse.app/Contents/Plugins/JamUI/jamCommand -importFile <full-path-to-the-jnprpreconfig-file>
   ```

### Junos Pulse Command-line Launcher

The Junos Pulse Launcher (pulselauncher.exe) is a standalone client-side command-line utility that allows you to launch Pulse and connect to or disconnect from a Pulse server (Pulse Secure Access Service or Pulse Access Control Service) without displaying the Pulse graphical user interface.

**Pulse Launcher Usage Notes:**

- Pulse Launcher runs on 32-bit and 64-bit endpoints.
- Pulse Launcher runs on the following platforms:
  - Windows XP
  - Windows Vista
  - Windows 7
- The Pulse Launcher program, pulselauncher.exe, is installed as part of a Pulse client installation in `Program Files\Common Files\Juniper Networks\Integration`.
- Pulse Launcher works only for the SA or IC connection type. The Pulse launcher does not support the Firewall or 802.1x connection types.
- The Pulse Launcher program does not support the role mapping option that prompts a user to select from a list of assigned roles. If you use the Pulse Launcher and more than one role can be assigned to a user, you must configure the role mapping settings for the realm to merge settings for all assigned roles. If the realm settings require the user to select a role, the Pulse Launcher command fails and exits with return code 2.
- The Pulse Launcher program does not support secondary authentication.
To use the Pulse Launcher program:

1. Write a script, batch file, or application.
2. Include a call to the Pulse Launcher executable, pulselauncher.exe.
3. Include logic in your script, batch file, or application to handle the possible return codes.

Table 7 on page 141 lists the Pulse Launcher return codes.

The following command shows the complete pulselauncher.exe command syntax:

```
```

Table 6: Pulse Launcher Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>-version</td>
<td>Display the Pulse Launcher version information, then exit.</td>
</tr>
<tr>
<td>-help</td>
<td>Display available arguments information.</td>
</tr>
<tr>
<td>-stop</td>
<td>Stop Pulse and disconnect all active connections.</td>
</tr>
<tr>
<td>-url &lt;url&gt;</td>
<td>Specify the Pulse server URL.</td>
</tr>
<tr>
<td>-u &lt;user&gt;</td>
<td>Specify the username.</td>
</tr>
<tr>
<td>-p &lt;password&gt;</td>
<td>Specify the password for authentication.</td>
</tr>
<tr>
<td>-r &lt;realm&gt;</td>
<td>Specify the realm on the Pulse server.</td>
</tr>
<tr>
<td>-d &lt;DSID&gt;</td>
<td>Passes a cookie to Pulse Launcher for a specified Pulse server from another authentication mechanism when Pulse Launcher starts. When you use the -d argument, you must also specify the -url argument to specify the Pulse server.</td>
</tr>
</tbody>
</table>
| -cert <client certificate> | Specify the certificate to use for user authentication. For <client certificate> use the string specified in the Issued To field of the certificate. When using the -cert argument, you must also specify the -url and -r <realm> arguments. To use certificate authentication with the Pulse Launcher program, you must first configure the Pulse server to allow the user to sign in via user certificate authentication. You must also configure a trusted client CA on the Pulse server and install the corresponding client-side certificate in the Web browsers of end-users before running the Pulse Launcher.
| -signout                  | Disconnect and sign out from a specific server. Pulse can have multiple simultaneous connections so the -url argument is required when you use the -signout argument. |

NOTE: If Pulse is launched through a browser, the browser handles certificate verification. If Pulse is launched through an application on Windows, the application handles certificate verification. If Pulse is launched through the Pulse Launcher on Windows, Pulse Launcher handles the expired or revoked client certificates.

If the certificate is invalid, the Pulse Launcher displays an error message on the command line and logs a message in the log file.
Table 6: Pulse Launcher Arguments (continued)

<table>
<thead>
<tr>
<th>Argument</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>-timeout &lt;time in seconds&gt;</td>
<td>The amount of time allowed for the connection to take place before the attempt fails. Min = 45 (default). Max = 600.</td>
</tr>
</tbody>
</table>

The following table lists the possible return codes pulselauncher.exe returns when it exits.

Table 7: Pulse Launcher Return Codes

<tr>
<td>5</td>
<td>User cancelled connection.</td>
</tr>
<tr>
<td>6</td>
<td>Client certificate error.</td>
</tr>
<tr>
<td>7</td>
<td>Timeout error.</td>
</tr>
<tr>
<td>8</td>
<td>No user connection allowed from Pulse UI.</td>
</tr>
<tr>
<td>9</td>
<td>No policy override from Pulse UI.</td>
</tr>
<tr>
<td>100</td>
<td>General error.</td>
</tr>
</tbody>
</table>

Examples

The following command is a simple login application that captures the credentials the user enters, and passes the credentials as arguments to pulselauncher.exe:

```
pulselauncher.exe -u JDoe -p my$Pass84 -url https://int-company.portal.com/usr -r Users
pulselauncher return code: 0
```

The following Pulse Launcher example shows a certificate authentication:

```
pulselauncher return code: 0
```
The following example shows a command to use Pulse Launcher to specify a cookie (-d) for a specific Pulse server (-url):

```
```
pulselauncher return code: 0

- Junos Pulse Client Installation Overview on page 127

Using jamCommand to Import Junos Pulse Connections

The jamCommand.exe program is a command line program that imports a .jnprpreconfig file into the Pulse client. The jamCommand program is available for Windows (XP, Vista, and Win7) and Mac OSX.

NOTE: What is “jam?” The working name for Junos Pulse during the early development phase was Juniper Access Manager. So many Pulse file names, directories, etc. include the acronym “jam.”

A .jnprpreconfig file includes Pulse connection parameters. You can create a .jnprpreconfig file on the Pulse server, and then use it as part of a Pulse installation to ensure that Pulse users have one or more Pulse connections when they start Pulse for the first time.

NOTE: One typical use case for jamCommand on a Windows endpoint is to first run jamCommand to import one or more Pulse connections from a .jnprpredong file, and then run pulselauncher.exe to start Pulse.

To install Pulse connections using jamCommand:

1. Create a .jnprpreconfig file on the Pulse server.
   In the Pulse server admin console, click Users > Junos Pulse > Components.
2. Select the component sets you want and then click Download Installer Configuration.
3. Distribute the .jnprpreconfig file to the Pulse endpoints.
4. Run jamCommand with the .jnprpreconfig file as an option. For example:
   On Windows:
   
   \Program Files\Common Files\Juniper Networks\JamUI\jamCommand-importfile myfile.jnprpreconfig.
   
   On Mac OSX:
   /Applications/Junos Pulse/Contents/Plugins/JamUI/jamCommand-importfile myfile.jnprpreconfig.
If the Pulse client is running when you run jamCommand, the new Pulse connection or connections appear immediately. The connection name appears as it was defined when you created the connection in the Pulse server admin console.

**Feature Comparison: Network Connect and Junos Pulse**

Network Connect (NC) is a client program for remote access. Junos Pulse includes most of the functionality of NC. Table 9 on page 151 compares the features of NC and Pulse. For detailed information about supported platforms and installation requirements, see the Junos Pulse Supported Platforms Guide, which is available at [http://www.juniper.net/support/products/pulse](http://www.juniper.net/support/products/pulse).

Junos Pulse for Mobile Devices

- Junos Pulse for Mobile Devices and Junos Pulse Mobile Security Suite on page 157
- Junos Pulse for Apple iOS on page 161
- Junos Pulse for Google Android on page 175
- Junos Pulse for Nokia Symbian Devices on page 191
- Junos Pulse for Windows Mobile Devices on page 195
Junos Pulse for Mobile Devices Overview

Junos Pulse for mobile devices enables authenticated access from mobile (handheld) devices to corporate applications such as corporate e-mail and the corporate intranet through Pulse Secure Access Service. The Pulse client software for mobile devices includes remote VPN capabilities as well as device security capabilities activated by the Junos Pulse Mobile Security Suite.

The Junos Pulse Mobile Security Suite (MSS) is an optional component of Junos Pulse for mobile devices. The MSS provides (depending on the device OS) antivirus, antispam, and personal firewall services and enables an administrator to monitor and remove device applications and content, perform backup and restore operations, activate remote lock and remote wipe operations, and track devices using GPS. Each supported mobile device supports a specific list of Pulse Mobile Security Suite features.

Each supported mobile device requires that the user install the Pulse client software for the particular device type. The Pulse app is available as a free download from the app stores of the supported mobile devices, and the Windows Mobile app is available from juniper.net. The Pulse MSS is available as a separate server-based product. Pulse for mobile devices and Pulse Mobile Security Suite software cannot be deployed directly from Pulse Secure Access Service. The type of secure connectivity and the supported security features vary according to what is supported on each mobile operating system.

Updated versions of each Junos Pulse mobile client are released independently of each other. Some client features are not available in earlier client releases. If necessary, the description of a particular feature includes the minimum release required for that feature. For VPN features, the Pulse client communicates with the Junos Pulse Secure Access Service. For Pulse Mobile Security Suite features, the client communicates with the Pulse Mobile Security Gateway. As a general rule, users should upgrade to the most recent Pulse client software version to insure compatibility with all server updates.
Pulse is supported on the following mobile devices:

- Junos Pulse for Apple® iOS (iPhone, iPad, and iPod Touch)
- Junos Pulse for Google Android™
- Junos Pulse for BlackBerry
- Junos Pulse for Windows® Mobile
- Junos Pulse for Nokia® Symbian

**NOTE:** Although BlackBerry devices are supported by the Pulse MSS, Junos Pulse VPN software is not available for BlackBerry. However, some BlackBerry devices include support for IKEv2 and you can configure the BlackBerry IKEv2 to connect to Pulse Secure Access Service. See the *Junos Pulse Mobile Supported Platforms Guide*, which is available at [http://www.juniper.net/support/products/pulse/mobile/](http://www.juniper.net/support/products/pulse/mobile/), for details about BlackBerry devices that can use IKEv2.

The *Junos Pulse Mobile Supported Platforms Guide* lists the mobile device OS versions supported by Pulse and the security features supported on each mobile device OS.

### Junos Pulse Mobile Security Gateway

Although you enable network access for Pulse on mobile devices using the Pulse Secure Access Service admin console, you manage the security features of the mobile devices by using the Junos Pulse Mobile Security Gateway. The administration interface of the Pulse Mobile Security Gateway enables you to protect and manage mobile devices. For more information, see the *Junos Pulse Mobile Security Gateway documentation*.

### Related Documentation

- Junos Pulse for Windows Mobile on page 195

### Pulse Mobile Clients and User Agent Strings

A user agent string is how a Web server identifies the type of browser that is requesting service. A Web server can use that information to provide content that is tailored for the browser. Portions of the Pulse user interface on a mobile device, such as the login screen and intranet bookmarks, are Web pages served from the Pulse server and displayed by the embedded browser of the Pulse client. The appearance of these Web pages can be affected by how the Pulse server is configured to map user agent strings to specific client types.

SA Series software Release 7.1 introduced new user agent string and client type pairings that are designed for each supported Pulse mobile device. If you change any of the user
agent string and client type pairings for mobile devices prior to upgrading your SA Series software to Release 7.1, your changes might cause Pulse mobile device screens to display content incorrectly. If the Pulse interface on mobile devices is not appearing as expected, you should remove your edited user agent string and client type pairings so that the Pulse clients can access the new configurations. SA Series software Release 7.2 introduced a change in how the Pulse secure access server provides the bookmarks index page so that changes to your configuration of user agent string and client type pairings do not affect how the mobile device displays the Pulse bookmarks.

To view and edit the user agent string and client type pairings on your Pulse server:

1. Click **System > Configuration > Client Types**.
   
   To edit an existing item, click an item in the table to select it. The string pattern is available for editing in a text box and you can select the client type from a list box.
   
   To add a new user agent string and client type pairing, type a string pattern in the edit box at the top of the list, choose a client type from the list box, and then click **Add**. You may use the * and ? wildcard characters in your string. Note that user agent strings are not case-sensitive.

2. To reorder the list, click an item to select it and then use the up and down arrow buttons to move the item up or down in the list. When a browser requests access, the user agent string submitted by the browser is compared against the list starting at the top of the list and continuing down the list until the first match is reached.

   The default pairing (User Agent String = "," , Client Type = "Standard HTML") is listed as the last entry in the table to ensure that it is used only when no other pairing applies. You cannot edit, delete, or reorder the default pairing.

3. When you finish making changes to the table, click **Save Changes**.

   Table 11 on page 159 lists the User Agent String and Client Type pairings for supported mobile devices in SA Series software.

Junos Pulse for Apple iOS Overview

Junos Pulse provides Layer 3 VPN connectivity based on SSL encryption and authentication between an Apple iOS device (iPhone, iPad, iPod Touch) and Junos Pulse Secure Access Service. Junos Pulse enables secure connectivity to corporate applications and data based on identity, realm, and role. Pulse is designed to provide battery-friendly connectivity by automatically disconnecting from the VPN when the device is inactive while on Wi-Fi, automatically reestablishing VPN connectivity when the device reactivated, and maintaining connectivity when roaming from network to network. Junos Pulse is available for download from the Apple App Store.

NOTE: Mobile client features are updated frequently and each mobile client has a release number that is independent from the other clients and from the Pulse Windows and Mac clients. We recommend that you upgrade your mobile clients to the latest release to ensure that all features described in this guide are supported on your devices.

The Junos Pulse Mobile Supported Platforms Guide, which is available at http://www.juniper.net/support/products/pulse/mobile/ lists the mobile device OS versions supported by Pulse and the security features supported on each mobile device OS.
The Junos Pulse VPN app supports the following features:

- Full Layer 3 tunneling of packets
- UDP/ESP and NCP/SSL modes
- Authentication by all authentication options available on the Pulse Secure Access server
- Certificate authentication followed by any other form of authentication
- Multi-factor authentication (cascading two different types of authentication)
- Host Checker
- Split tunneling modes:
  - Split tunneling disabled with access to local subnet
  - Split tunneling enabled
- Apple VPN on Demand

A VPN on Demand configuration enables an iOS device to automatically initiate a VPN connection when any application running on the phone initiates a connection to a host in a predefined set of hosts. A VPN on Demand connection uses client certificate-based authentication so the user does not have to provide credentials every time a VPN connection is initiated.

**NOTE:**

When you configure VPN on Demand, you must create an exception for your Pulse Secure Access server hostname. For example, if the hostname is sslvpn.example.com and you want Pulse clients to automatically establish the VPN whenever requests are made for hosts in the example.com domain, the VPN on Demand configuration should contain the following rules:

- If domain name = sslvpn.example.com, then never initiate VPN connection
- If domain name = example.com, then always initiate VPN connection

There are different methods for creating VPN on Demand connections:

- Use the iPhone Configuration Utility. For complete information about how to create a VPN on Demand configuration using the iPhone Configuration utility, see the *iPhone OS Enterprise Deployment Guide*, which is available at www.apple.com.
- Use the mobile device management (MDM) features of the Junos Pulse Mobile Security Suite. Pulse Mobile Security Suite provides device management as well as security. For complete information about MDM, see the *Junos Pulse Mobile Security Gateway documentation*.
- Create and manage VPN On Demand configurations from within the Junos Pulse for iOS client.
Monitor and Control features of the Junos Pulse Mobile Security Suite.

Junos Pulse for iOS also supports the Junos Pulse Mobile Security Suite (MSS) R3.0 and later. Using the Pulse Mobile Security Gateway, the security administrator can define Pulse connections and other profile settings, and then those settings are downloaded to the device when it registers with the gateway and updated periodically. For more information, see the Junos Pulse Mobile Security Gateway documentation.

Before You Begin

Before you configure support for Apple iOS devices with Junos Pulse Secure Access Service, keep in mind the following client software behaviors:

- With Wi-Fi connectivity, Pulse reconnects the VPN tunnel automatically when the user wakes up the device. With 3G connectivity, the VPN reconnects when the user generates network traffic using an application like Safari or Mail.
- Establishing the VPN tunnel through a proxy is supported (regardless of the split tunnel mode), except for proxies that require authentication credentials.
- A Proxy Automatic Configuration (PAC) script takes effect only when split tunneling mode is disabled with access to local subnet. The PAC script does not work when the role's split tunnel mode is Enable split tunneling.
- Static host mapping is not created for the Pulse server/proxy hostname.
- DNS considerations:
  - When split tunneling is set to Split tunneling disabled with access to local subnet, Pulse uses the DNS servers that are configured the Pulse server.
  - When split tunneling is set to Split tunneling enabled, DNS servers that are configured on the Pulse server are used only for hostnames within the Pulse Secure Access Service domains.
- Session scripts are not supported.
- Web-based installation from a Junos Pulse server is not supported.
- Session timeout reminders are not supported.
- When you use client certificate authentication, and the user is enabled to select from among assigned roles, the user is prompted to enter the role name instead of being presented with a list of roles.
- To ensure that users see consistent bookmarks in the Pulse client UI no matter which server they are connected to, you can configure and enable user record synchronization, a feature of the Pulse Secure Access Service platform.

• About User Record Synchronization

Configuring a Role and Realm for Pulse for Apple iOS

To enable SSL/VPN access from an Apple iOS device to Pulse Secure Access Service, the device user must download, install, and configure the Junos Pulse app, and the Pulse administrator must configure specific realm and role settings on Pulse Secure Access Service.

To configure Pulse Secure Access Service for Apple iOS device access:

1. Log in to the Pulse server admin console.
2. Select **User Roles > New User Role**.
3. On the New Role page, specify a name for the role and, optionally, a description. Make note of the name because later in this procedure, you create a realm and map realm users to this role.
4. In the Access Features section of the New Role page, select the **VPN Tunneling** check box.
5. Click **Save Changes** to create the role and to display the role configuration tabs.
   Specifying Host Checker policies is part of the role configuration. However, you must first create the policy you want to assign to the role, so that procedure is covered later.
6. Select **Web > Bookmarks** and then click **New Bookmark**.
7. Specify a name and description for the bookmark.
   You must create bookmarks to enable the buttons that appear in the Pulse for iOS user interface. Typically, you create a bookmark for your company intranet and for Web e-mail.
   
   **NOTE:** You must create an e-mail bookmark to enable the e-mail button within the Pulse interface on the iOS device, and that e-mail bookmark must be named **Mobile Webmail**.
8. In the URL box, specify the Web address for access to your organization’s e-mail.
NOTE: Alternatively, you can use Web resource policies to define the bookmarks.

9. Set the **Auto Allow** and **Display Options** as desired, and then click **Save Changes**.

10. On the VPN Tunneling tab, set the Split Tunneling Options by selecting the following options:

- **Split Tunneling**: Enable
- **Route Precedence**: Endpoint routes

These are the only split tunneling modes supported on iOS.

11. To change default session time-outs, select **General > Session Options**.

12. In the Session lifetime section, specify **Max. Session Length** in minutes. The remaining session time appears on the Pulse interface of the mobile device client in the format **days hours:minutes:seconds**. The other session settings are not applied to mobile clients.

13. Click **Save Changes**.

14. Select **Users > Resource Policies > VPN Tunneling > Connection Profiles**.
A resource policy is a system rule that specifies resources and actions for a particular access feature.

15. Click New Profile.

16. Specify a name and description for the connection profile.

When you define the connection profile, note the following:

- IP Address Assignment options—When Pulse Secure Access Service receives a client request to start a session, it assigns an IP address to the client based on the IP address policies you define.

- Connection Settings—ESP is the default transport. The Pulse for iOS VPN client supports both ESP and SSL.

- DNS Settings—Searching IVE DNS first with split tunneling enabled is not supported. With split tunneling enabled, Junos Pulse uses the IVE DNS for queries for hosts in the IVE DNS search domains only. All other queries go to the client’s DNS servers.

- Proxy Server Settings—The Pulse for iOS client software supports all of the proxy server settings except Preserve client-side proxy settings. That option is specific to the Windows client only. Automatically modifying the client proxy configuration when split tunneling is enabled is not supported.

17. In the Roles area, select Policy applies to SELECTED roles. Then add the role you created for iOS devices to the Selected roles list.

18. Click Save Changes.

20. Specify a name and description. Then click Save Changes to create the realm and to display the realm option tabs.

21. In the Servers section, specify the authentication settings.

   Authentication server configuration is covered in the Junos Pulse Secure Access Service Administration Guide.

22. On the General tab for the realm, select the Session Migration and Sharing check box.

23. On the Role Mapping tab for the realm, create a new rule that maps all users to the iOS device role you created earlier in this procedure.

Allowing iOS Users to Save Webmail Password

A Web bookmark on the role for iOS users allows users to access e-mail through a Web link. You can allow users of the Pulse for iOS app to save their e-mail password when they login to the e-mail system. After you have created a Mobile Webmail bookmark for the role used by iOS users, enable password the option for user to save their e-mail password by doing the following.

1. Open the role you created for iOS users.
2. Click General > Session Options.
3. In the section labeled Persistent Password Caching, select Enabled.
4. Click Save Changes.

Host Checker for Pulse iOS Clients

Host Checker is a component of Junos Pulse that reports the integrity of iOS endpoints that are attempting to connect to Pulse Secure Access Service. Host Checker runs as a Trusted Network Connect (TNC) client on the endpoint. The client evaluates the endpoint according to predefined criteria and reports to the Trusted Network Connect server, which is a part of Pulse Secure Access Service. If the endpoint is not in compliance with the Host Checker policies, then the user might not get access to the network or might get limited access to the network depending upon the enforcement policies configured by the administrator.

For iOS clients, Host Checker can evaluate client compliance based on the following predefined criteria:

- **OS Checks**—You can specify the iOS version or minimal version that must be installed on the device.
- **Jail Breaking Detection**—Jail breaking is a process that allows Apple iPhone, iPad and iPod Touch users to gain root access to the iOS operating system and bypass usage and access limitations imposed by Apple. With a jail broken device, an iOS user can install applications that are not available through the Apple App Store. Jail broken devices expose the device to a greater risk of running malicious applications.
- **Mobile Security Suite**—Pulse Mobile Security Suite (MSS) for iOS supports features that help protect the iOS device if it is lost or stolen: remote wipe, remote lock, and locate. Pulse MSS also allows the MSS administrator to provide VPN configurations to the device and enforce other usage practices such as requiring a lock password and specifying the password strength. Host Checker enables you to require that an iOS device have the Pulse Mobile Security Suite installed and enabled.
NOTE: The Pulse MSS check on the client is based on the presence of a valid client certificate issued by the Mobile Security Gateway. Therefore, to configure this Host Checker item, you need to add the CA used by MSS in the Certificates section of the Pulse Secure Access Service admin console.

### Configuring Host Checker for Pulse iOS Clients

Host Checker policies can be part of a larger Host Checker configuration that applies to many different types of clients or to iOS devices only. However, you might find it easiest to create a separate Host Checker policy specifically for iOS devices.

NOTE: One type of iOS Host Checker rule, the Pulse Mobile Security Suite (MSS) check, requires that an iOS device be registered with the MSS. To create this type of rule, you must specify the same trusted client certificate authority (CA) that is configured on the Pulse Mobile Security Gateway (MSG). This means that the CA must already be defined in the Certificates section of the Pulse Secure Access Service admin console before you can create this type of Host Checker rule. The Junos Pulse Secure Access Service Administration Guide includes complete information on configuring the certificate environment for the Pulse Secure Access Service.

To create a Host Checker policy for iOS devices:

1. From the admin console, select **Authentication > Endpoint Security > Host Checker**.
2. In the Policies section, click **New** to open a New Host Checker Policy page.
3. Specify a name for the new policy and then click **Continue** to open the Host Checker Policy page.
   - The name appears in lists when you implement the policy so be sure to use a descriptive name, such as **iOS HC Policy**.
4. Click the Mobile tab, and then click the iOS tab.
5. In the Rule Settings section, click **Select Rule Type** and select one of the following options and then click **Add**:
   - **OS Checks**—To specify the iOS version that must be installed on the device:
     a. Specify a descriptive name for this rule. For example **Must-Be-iOS-4.1-or-higher**. Rule names cannot include spaces.
b. Specify the criteria. For example, to enforce iOS 4.1 or higher, create two conditions: Equal to 4.1 and Above 4.1.

Host Checker supports iOS versions 4.1 through 4.3.x.

c. Click **Save Changes**.

• **Jail Breaking Detection**—Jail breaking is a process that allows Apple iPhone, iPad, and iPod Touch users to gain root access to the iOS operating system, and bypass usage and access limitations imposed by Apple. With a jail broken device, an iOS user can install applications that are not available through the Apple App Store. Jail broken devices possess a greater risk of running malicious applications.

a. Specify a descriptive name for this rule. For example **No-iOS-Jailbreak**.

b. The **Don’t allow Jail Broken devices** check box is enabled by default.

c. Click **Save Changes**.

• **Mobile Security Suite**—Pulse Mobile Security Suite (MSS) for iOS supports features that help protect the iOS device if it is lost or stolen: remote wipe, remote lock, and locate. Pulse MSS also allows the MSS administrator to provide VPN configurations to the device. An MSS rule allows you to require that an iOS device have MSS installed and enabled.

a. Specify a descriptive name for this rule. For example **iOS-MSS**.

b. In the Criteria section, the **Enable Mobile Security Suite on the device** check box is enabled by default.

c. Click the **MDM Trusted client CA** box to choose a certificate authority.

MDM (Mobile Device Management) enables remote configuration and management of mobile devices. Secure Access Service verifies registration with Pulse MSS through the presence of a valid client certificate issued by the Mobile Security Gateway. Therefore, to configure this Host Checker item, you need to know the client certificate authority that is used by the Pulse Mobile Security Gateway. The certificate authorities listed in the box are defined in the System > Configuration section of the Pulse Secure Access Service admin console.

d. Optionally, specify additional criteria (the certificate field and expected value), and then click **Add**.

e. Click **Save Changes**.

6. After you have configured all of your rules, specify how you want to enforce them by choosing one of the following options:

• All of the rules

• Any of the rules

• Custom
For Custom requirements, you can specify a custom expression using Boolean operators AND and OR and also group and nest conditions using parenthesis.

7. Specify remediation options:
   • Enable custom instructions—If you enable this check box, a text box appears and allows you to type information that appears on the user’s device if Host Checker discovers an issue. For example, if you enabled the MSS rule that terminates the VPN session of Host Checker discovers a virus, you can instruct the user to run a virus scan to clear the issue before trying to connect.
   • Send reason strings—Select this option to display a message to users (called a reason string) that explains why the client machine does not meet the Host Checker policy requirements. For example, if the jailbreak detection policy fails, Pulse appears, **A jailbroken device is not allowed to access the network. Please contact your network administrator.**

8. When you are finished, click **Save Changes**.

**Implementing Host Checker Policies for Pulse for iOS Devices**

After you create one or more Host Checker policies for iOS devices, you must implement them. Pulse Secure Access Service can use Host Checker policies at the realm or the role level.

**Realm Authentication**—You can configure a realm authentication policy to download and run Host Checker with a particular Host Checker policy. If the iOS device does not meet the Host Checker requirements, then Pulse Secure Access Service can deny access. You can provide remediation information in the Host Checker policy to describe the requirement and help users take steps to solve the issue.

To enable a Host Checker policy for a realm:

1. From the admin console, select **Users > User Realms > SelectRealm > Authentication Policy > Host Checker**. The Host Checker page displays all of the available Host Checker policies.

2. Select the check box next to each policy you want to include. Select one or both of the following check boxes next to the policy:
   • **Evaluate Policies**—Evaluates without enforcing the policy on the iOS device and allows access.
   • **Require and Enforce**—Requires that the iOS device be in compliance with the Host Checker policy. Pulse Secure Access Service downloads Host Checker to the iOS device after the user is authenticated and before the user is mapped to any roles
in the system. Selecting this option automatically enables the Evaluate Policies option.

3. Optionally select **Allow access to realm if any ONE of the selected “Require and Enforce” policies is passed**. This check box is available if you selected more than one Host Checker policy. If you enable this check box, an iOS device is allowed access if it passes any of the Require and Enforce policies. The Cache Cleaner policy does not apply to iOS devices.

4. Click **Save Changes**.

**Role**—You can configure a role to download and run Host Checker with a particular Host Checker policy. If the iOS device does not meet the Host Checker requirements, then Secure Access can deny access or assign the user to a remediation role that has limited access. You can provide remediation information in the Host Checker policy to help users take steps to solve the issue.

To enable a Host Checker policy for a role:

1. From the admin console, select **Users > User Roles > SelectRole > General > Restrictions > Host Checker**. The Host Checker page displays all of the available Host Checker policies.

2. Select **Allow users whose workstations meet the requirements specified by these Host Checker policies**.

3. In the Available Policies list, select the policies that you want to apply to select them, and then click Add to move them to the Selected Policies list. To select a policy click it. So select more than one policy, use Ctrl+click.

4. Optionally select **Allow access to realm if any ONE of the selected “Require and Enforce” policies is passed**. This check box is available if you selected more than one Host Checker policy. If you enable this check box, an iOS device is allowed access if it passes any of the Require and Enforce policies. The Cache Cleaner policy does not apply to iOS devices.

5. Click **Save Changes**.

### Installing the Junos Pulse VPN App

Perform the following configuration on each iOS device that is to connect to Pulse Secure Access Service.

1. Download the Junos Pulse app from the iTunes App Store.
2. On the iOS device, launch Junos Pulse.
3. Tap the Configuration item on the main status page to display Pulse configurations.
4. Create a new configuration with the URL that you defined as the sign-in URL for mobile devices. Then configure the certificate settings as required.

**NOTE:** When iPhone users launch Pulse for the first time, they see a security warning and a prompt for enabling Pulse SSL VPN functionality. This security precaution helps deter the silent installation of malicious VPN software. If the user declines the Pulse software, the Pulse splash screen appears until the user presses the Home button on the device. If the user accepts the Pulse software, the security warning no longer appears when Pulse is started.

**NOTE:** For certificate authentication, the Pulse Secure Access Service SSL certificate must be issued by a CA. It cannot be self-signed. If the CA is not one of the built-in trusted CAs on the iOS device, then the CA certificate must be imported into the iOS device. Also, the Pulse Secure Access Service must be accessed using a hostname (not an IP address), and the hostname must match the Common Name of the Pulse Secure Access Service SSL certificate.

**NOTE:** The Pulse iOS app also supports the Junos Pulse Mobile Security Suite (MSS) R3.0 and later. Using the Pulse Mobile Security Gateway, the security administrator can define Pulse connections and other settings, and then those settings are downloaded to the device when it registers with the gateway. For more information, see the Junos Pulse Mobile Security Gateway documentation.

**Related Documentation**

- Junos Pulse for Apple iOS Overview on page 161

### Using Configuration Profiles

Instead of instructing users to create Pulse VPN configurations manually, you can use a Configuration Profile to define Pulse configurations for the iOS device, and then distribute the configuration profiles by e-mail or by posting them on a Web page. When users open the e-mail attachment or download the profile using Safari on their iOS device, they are prompted to begin the installation process.

You use the iPhone Configuration Utility to create configuration profiles and specify Juniper SSL as the Connection Type for the VPN Payload. You can download the iPhone Configuration Utility (3.0 or later) from the Apple support Web. For details about the utility and how to create Configuration Profiles, see the *iPhone OS Enterprise Deployment Guide*, which is available at [www.apple.com](http://www.apple.com).
NOTE: The Pulse iOS app also supports the Junos Pulse Mobile Security Suite (MSS) R3.0 and later. Using the Pulse Mobile Security Gateway, the security administrator can define Pulse connections and other settings within a profile and then those settings are downloaded to the device when it registers with the gateway and updated when the device periodically checks in with the server after registration. For more information, see the Junos Pulse Mobile Security Gateway documentation.

Collecting Log Files

The iOS device user can use the following procedure to e-mail the Junos Pulse log files:

1. On the iOS device, start the Junos Pulse app.
2. Tap Status.
3. Tap Logs > Send Logs.
4. Enter an e-mail address and tap Send.

Junos Pulse for Android Overview

Junos Pulse can create an authenticated SSL session between a device running Google Android and Pulse Secure Access Service. Junos Pulse enables secure connectivity to Web-based applications and data based on identity, realm, and role. Junos Pulse is available for download from the Android Market. The Junos Pulse Mobile Supported Platforms Guide, which is available at http://www.juniper.net/support/products/pulse/mobile/ lists the mobile device OS versions supported by Pulse and the security features supported on each mobile device OS.

NOTE: The Google Android OS has limitations in its support for certificate-based authentication. For successful certificate authentication, the user certificate and the private key must be separate files. If necessary, you can separate the private key from the certificate by using openssl commands before you install the certificate and the key on the Android device. The Juniper Networks Knowledgebase includes an article, KB19692, that describes in detail how to create a certificate and key that enables successful certificate authentication for Junos Pulse on Android.

NOTE: To ensure that users see consistent bookmarks in the Pulse client UI no matter which server they are connected to, you should configure and enable user record synchronization, a feature of the Pulse Secure Access Service platform.
Configuring a Role and Realm for Pulse for Android

To enable access from an Android device to Pulse Secure Access Service the Pulse administrator must configure specific realm and role settings on the Pulse server.

To configure Pulse Secure Access Service for Android device access:

1. Log in to the Pulse server admin console.
2. Select User Roles > New User Role.
3. On the New Role page, specify a name for the role and, optionally, a description. Make note of the name because later in this procedure, you create a realm and map realm users to this role.
4. In the Access Features section, select Web.
5. Click Save Changes to create the role and to display the role configuration tabs.
6. Select Web > Bookmarks and then click New Bookmark.

You must create bookmarks to enable the buttons that appear in the Pulse for Android user interface. Typically, you create a bookmark for your company intranet and for Web e-mail. You must create an e-mail bookmark to enable the e-mail button within the Pulse interface on the Android, and that e-mail bookmark must be named Mobile Webmail.
Figure 16: Creating the E-mail Bookmark for the Pulse Client

NOTE: Alternatively, you can use Web resource policies to define the bookmarks.

7. To change default session timeouts, select General > Session Options.

8. In the Session lifetime section, specify Max. Session Length in minutes. The remaining session time appears on the Pulse interface of the mobile device client in the format days hours:minutes:seconds. The other session settings are not applied to mobile clients.

10. Specify a name and, optionally, a description and then click Save Changes to create the realm and to display the realm option tabs.

11. On the Authentication Policy tab for the realm, click Host Checker and enable the optional Pulse Mobile Security check to require that mobile device users have Pulse Mobile Security software installed and enabled. See “Junos Pulse Mobile Security Overview” on page 203 for more information.

12. On the Role Mapping tab for the realm, create a new rule that maps all users to the Android role you created earlier in this procedure.
Allowing Android Users to Save Webmail Password

A Web bookmark on the role for Android users allows users to access e-mail through a Web link. You can allow users of the Pulse for Android app to save their e-mail password when they login to the e-mail system. After you have created a Mobile Webmail bookmark for the role used by Android users, enable password the option for user to save their e-mail password by doing the following.

1. Open the role you created for Android users.
2. Click General > Session Options.
3. In the section labeled Persistent Password Caching, select Enabled.
4. Click Save Changes.

Host Checker for Pulse Android Clients

Host Checker is a component of Junos Pulse that reports the integrity of Android endpoints that are attempting to connect to Pulse Secure Access Service. Host Checker runs as a Trusted Network Connect (TNC) client on the endpoint. The client evaluates the endpoint according to predefined criteria and reports to the Trusted Network Connect server, which is a part of Pulse Secure Access Service. If the endpoint is not in compliance with the Host Checker policies, then the user might not get access to the network or might get limited access to the network depending upon the enforcement policies configured by the administrator.

For Android clients, Host Checker can evaluate client compliance based on the following predefined criteria:

- **OS Checks**—You can specify the iOS version or minimal version that must be installed on the device.
- **Root Detection**—Rooting is a process that allows Android users to gain root access to the operating system and bypass usage and access limitations imposed by device manufacturers and carriers. With a rooted device, a user can install applications that are not available and have not been certified by the device manufacturer or by the app store process. Rooted devices expose the device to a greater risk of running malicious applications. Host Checker can detect rooted devices and then allows or deny network access based on the Host Checker enforcement policy.
Mobile Security Suite—Pulse Mobile Security Suite (MSS) for Android supports antivirus, antispam, and features that help protect the device if it is lost or stolen: remote wipe, remote lock, and locate. Host Checker enables you to require that an Android device have the Pulse Mobile Security Suite installed and enabled. The Pulse MSS is detected by the presence of a valid client certificate issued by the Mobile Security Gateway. Therefore, to configure this Host Checker item, you need to know the client certificate authority that is used by the Pulse Mobile Security Gateway.

NOTE: Junos Pulse Secure Access Service software release 7.1 (IVE OS 7.1R1) introduced a different implementation of this feature, and that implementation is still available in subsequent releases of the software. In the earlier implementation, you can enable a Mobile Security Check as part of Host Checker component of a realm authentication policy. Although you can still use this earlier implementation of the Mobile Security Suite check, we recommend that you employ the Host Checker policy rather than the realm authentication method. The two methods are compatible so you can enable both. However, enabling both methods is not recommended because that would cause Pulse Secure Access Service to run two different checks to accomplish one task.

Configuring Host Checker for Pulse Android Clients

Host Checker policies can be part of a larger Host Checker configuration that applies to many different types of clients or to Android devices only.

To create a Host Checker policy for Android devices:

1. From the admin console, select Authentication > Endpoint Security > Host Checker.
2. In the Policies section, click New to open a New Host Checker Policy page.
3. Specify a name for the new policy and then click Continue to open the Host Checker Policy page.
   The name appears in lists when you implement the policy so be sure to use a descriptive name, such as Android HC Policy.
4. Click the Mobile tab, and then click the Android tab.
5. In the Rule Settings section, click Select Rule Type and select one of the following options and then click Add:
   - OS Checks—To specify the iOS version that must be installed on the device:
a. Specify a descriptive name for this rule. For example *Must-Be-Android-2-2-or-higher*. Rule names cannot include spaces.

b. Specify the criteria. For example, to enforce Android 2.2 or higher, create two conditions: Equal to 2.2 and Above 2.2.

   Host Checker supports Android versions 1.6 through 3.1.

c. Click **Save Changes**.

- **Rooting Detection**—Rooting is a process that allows Android users to gain root access to the operating system and bypass usage and access limitations imposed by manufacturers and service providers. With a rooted device, an Android user can install applications that have not been certified through the app store process. Rooted devices possess a greater risk of running malicious applications.

   a. Specify a descriptive name for this rule. For example *No-Android-root*.

   b. The **Don’t allow rooted devices** check box is enabled by default.

   c. Click **Save Changes**.

- **Mobile Security Suite**—Pulse Mobile Security Suite (MSS) for Android supports features that help protect the device from viruses and malware and can help protect the device if it is lost or stolen.

   a. Specify a descriptive name for this rule. For example *Android-MSS*.

   b. In the Criteria section, the **Enforce Mobile Security Suite on the device** check box is enabled by default.

   c. Click the **Terminate the user session if a threat/virus is found** box to have the Pulse server end the VPN session if Host Checker finds a virus or malware on the device. The user should be instructed to run the Pulse Mobile Security Suite virus scan on their device and remove the threats to before attempted to establish a VPN connection. The Host Checker policy allows you to enable custom instructions and provide instructions to users that appear if Host Checker finds an issue on the device.

   d. Click **Save Changes** to save the rule and open the Host Checker Policy page.

6. After you have configured all of your rules, specify how you want to enforce them by choosing one of the following options:

   - All of the rules
   - Any of the rules
   - Custom

   For Custom requirements, you can specify a custom expression using Boolean operators AND and OR and group and nest conditions using parenthesis.

7. Specify remediation options:
Enable custom instructions—If you enable this check box, a text box appears and allows you to type information that appears on the user’s device if Host Checker discovers an issue. For example, if you enabled the MSS rule that terminates the VPN session of Host Checker discovers a virus, you can instruct the user to run a virus scan to clear the issue before trying to connect.

Send reason strings—Select this option to display a message to users (called a reason string) that is returned by Host Checker or integrity measurement verifier (IMV) and explains why the client machine does not meet the Host Checker policy requirements. For example, if the rooting detection policy fails, Pulse displays, “A rooted device is not allowed to access the network. Please contact your network administrator.

8. When you are finished, click Save Changes.

Related Documentation

Implementing Host Checker Policies for Pulse for Android Devices

After you create one or more Host Checker policies for Android devices, you must implement them. Pulse Secure Access Service can use Host Checker policies at the realm or the role level.

Realm Authentication—You can configure a realm authentication policy to download and run Host Checker with a particular Host Checker policy. If the Android device does not meet the Host Checker requirements, then Pulse Secure Access Service can deny access. You can provide remediation information in the Host Checker policy to describe the requirement and help users take steps to solve the issue.

To enable a Host Checker policy for a realm:

1. From the admin console, select Users>UserRealms>SelectRealm>Authentication Policy>Host Checker. The Host Checker page displays all of the available Host Checker policies.

2. Select the check box next to each policy you want to include. Select one or both of the following check boxes next to the policy:
   - Evaluate Policies—Evaluates without enforcing the policy on the Android device and allows access.
   - Require and Enforce—Requires that the Android device be in compliance with the Host Checker policy. Pulse Secure Access Service downloads Host Checker to the Android device after the user is authenticated and before the user is mapped to any roles in the system. Selecting this option automatically enables the Evaluate Policies option.
3. Optionally select **Allow access to realm if any ONE of the selected “Require and Enforce” policies is passed**. This check box is available if you selected more than one Host Checker policy. If you enable this check box, an Android device is allowed access if it passes any of the Require and Enforce policies. The Cache Cleaner policy does not apply to Android devices.

4. Click **Save Changes**.

**Role**—You can configure a role to download and run Host Checker with a particular Host Checker policy. If the Android device does not meet the Host Checker requirements, then Secure Access can deny access or assign the user to a remediation role that has limited access. You can provide remediation information in the Host Checker policy to help users take steps to solve the issue.

To enable a Host Checker policy for a role:

1. From the admin console, select **Users>User Roles>SelectRole>General>Restrictions>Host Checker**. The Host Checker page displays all of the available Host Checker policies.

2. Select **Allow users whose workstations meet the requirements specified by these Host Checker policies**.

3. In the Available Policies list, select the policies that you want to apply to select them, and then click Add to move them to the Selected Policies list. To select a policy click it. So select more than one policy, use Ctrl+click.

4. Optionally select **Allow access to realm if any ONE of the selected “Require and Enforce” policies is passed**. This check box is available if you selected more than one Host Checker policy. If you enable this check box, an Android device is allowed access if it passes any of the Require and Enforce policies. The Cache Cleaner policy does not apply to Android devices.

5. Click **Save Changes**.

**Junos Pulse for Android Error Messages**

The following error message summary for Junos Pulse for Android describes possible issues and suggests resolution actions where possible.

**Junos Pulse for Android VPN Error Messages**

<table>
<thead>
<tr>
<th>Invalid certificate error</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Message</strong></td>
</tr>
<tr>
<td>The certificate for this server is invalid. Tap Accept to connect to this server anyway.</td>
</tr>
</tbody>
</table>
Occurs When

- A Pulse user clicks Connect and the server certificate for the page received from the Pulse server is not valid.

The user can perform one of the following actions:

- Click View Certificate to examine the certificate.
- Click Accept and open the URL.
- Click Decline. The connection attempt is ended.

Session Disconnected error

Message
Session disconnected due to invalid certificate.

Occurs When

- The Pulse client downloads session information from the Pulse server and the certificate received from the server does not match the stored session certificate.
- While accessing e-mail or intranet, the certificate received from Pulse server does not match the previously stored session certificate

The user can perform the following action:

- Click the Close button on the Alert dialog to return to home screen. User can retry the connection.

VPN not supported error

Message
On the Pulse client status screen, VPN status appears as Not Supported.

Occurs When

- The device does not support VPN.

The user can perform the following action:

- Click the Close button on the Alert dialog to return to home screen. User can retry the connection.

Sign-in error

Message
Failed to connect to the server!
**Occurs When**

- Sign-in Process failed.

The user can perform the following action:

- Check the network connection (for example, Wi-Fi, 3G, etc.), and then retry the connection.

**Database operation error**

**Message**
Failed to process the HTML information from the server!

**Occurs When**

- SQLite database operation error during sign-in process.

The user can perform the following action:

- Retry the operation.

**Session terminated error**

**Message**
Your session was terminated. Please connect again.

**Occurs When**

- An invalid URL was used while accessing intranet and e-mail pages.

The user can perform the following action:

- Reconnect to the Pulse server.

**Host-checker error**

**Message**
Compliance Check couldn’t be completed. Please try after some time.
Occurs When

- Host checker compliance check couldn’t be completed during sign-in process.

The user can perform the following action:

- User is brought back to home screen. User should try to connect again

Launching the Junos Pulse for Android App with a Command

The Junos Pulse for Android VPN API enables you to start (or stop) a Junos Pulse VPN connection from an external Android app. This feature requires Junos Pulse for Android R4.0 or higher. If you implement the API call so that it provides all necessary information, Pulse starts and establishes a VPN connection with no input from the user, and then passes a result code and corresponding data back to the external app. If the API call does not include all of the necessary information, for example, no password is specified, the Pulse login page appears and the user must provide the required information.

When Pulse is launched programmatically to initiate a VPN connection, the following connection behaviors occur.

- If Pulse is not already installed on the device, an error occurs. If Pulse is not already running, Pulse is launched. The next step depends on the current Pulse connection status and configuration. One of the following occurs:

- If Pulse does not already have an active connection to a Pulse Secure Access server, it uses an existing configuration to establish a VPN connection to the Pulse server.

- If Pulse does not already have an active connection, and it does not already have a configuration for the target Pulse server, Pulse opens the Add Configuration screen and populates the login fields that are included in the call. The user must specify any missing information.

- If the Pulse app is already connected to the Pulse server specified in the connection request, the API returns status that Pulse is already connected. It is the calling application's responsibility to maintain state of which Pulse server it is connected to in order to make the correct API call.

Usage notes:

- If the user has specified the username, realm, and role when creating the VPN configuration in the Junos Pulse app, those values are used to auto-fill the username, realm, and role for the login pages during login.

- Error messages related to authentication or Host Checker failure are not supported. In case of incorrect user credentials, the Pulse login screen appears and the user must manually provide credentials.

- The VPN notification icon appears on the Android device after the VPN connection is established and it is cleared when the VPN is session is disconnected.

To launch Pulse and connect to the Pulse server from an external Android app, you use an explicit intent. The explicit intent names the component to be called by the Android
system by using the Java class as the identifier. Pulse authenticates using the Android Webkit framework. It passes the result code and corresponding data back to the external app.

You use the VPN status command to determine run time status of the VPN connection. The status command allows you to handle the use case where the VPN connect command results in a successful session connect with the Pulse server, but the VPN tunnel was not established.

To stop the VPN connection, the external app sends an explicit intent to Pulse to disconnect, and then Pulse disconnects the VPN connection and passes a result code back to the app.

Junos Pulse for Android VPN API Reference

Junos Pulse for Android VPN API enables the VPN connection as follows.

1. The external app sends an Android explicit intent to the Junos Pulse app to authenticate the user and start a VPN connection. The intent contains VPN commands and parameters.
2. Pulse checks if the device supports VPN. If not then it returns that information to the calling app.
3. For a VPN connect command, Pulse checks the user credentials passed through the intent. For a URL that is not already defined on the device, a new Pulse connection profile is created and shown to the user to save or update. The intent then authenticates using the Webkit framework and starts the VPN connection.
4. For a VPN status command, the status of a the VPN connection is returned. Status includes the Pulse server IP address, data sent, data received, and the connection start time.
5. For a VPN disconnect command, Pulse disconnects the user session and stops the VPN connection.
6. Pulse passes the result code and corresponding data in a call back to the external app. The external app must implement the callback function.

The VPN API will internally use the Android Intent API calls to add extended data to the intent. The name must include a package prefix.

Explicit Intent Target Component

| Package name/Class | net.juniper.junos.pulse.android/net.juniper.junos.pulse.android.ui.ExplicitIntentActivity |

Explicit Intent API — VPN Connect

Command Extra
Extra Name: “Junos Pulse Vpn Command”
Extra Value and Type: 1 [integer]
Required: Yes
Command Parameters Extra:

1. Extra Name: “Url”  
   Extra Value and Type: Valid SA Url [String]  
   Required: Yes

2. Extra Name: “Username”  
   Extra Value and Type: Valid Username [String]  
   Required: No

3. Extra Name: “Password”  
   Extra Value and Type: Valid Password [String]  
   Required: No

4. Extra Name: “Realm”  
   Extra Value and Type: Valid Realm [String]  
   Required: No

5. Extra Name: “Role”  
   Extra Value and Type: Valid Role [String]  
   Required: No

6. Extra Name: “Certpath”  
   Extra Value and Type: Valid certificate file path on device [String]  
   Required: No

7. Extra Name: “Keypath”  
   Extra Value and Type: Valid certificate key file path on device [String]  
   Required: No

Callback Return Code and Intent Parameters

1. JUNOS_PULSE_RETURN_CODE_SESSION_CONNECTED [Value = 6]  
   Intent Params: None

2. JUNOS_PULSE_RETURN_CODE_SESSION_DISCONNECTED [Value = 7]  
   Intent Params: None  
   Return code 7 indicates that VPN disconnect succeeded.

3. JUNOS_PULSE_RETURN_CODE_VPN_NOT_SUPPORTED [Value = 3]  
   Intent Params: None  
   Return code 3 indicates that VPN is not supported on this device. VPN using Junos 
   Pulse is not supported on all devices. All pre-Android ICS, non-Samsung, non-Lenovo, 
   non-plugin devices should return this status code. Junos Pulse for Android is supported 
   on Android 2.1 and higher (API Level 7) devices. Devices that are running an earlier 
   version of Android do not see Pulse on Google Play.

**Explicit Intent API — VPN Disconnect**

Command Extra  
Extra Name: “Junos Pulse Vpn Command”  
Extra Value and Type: 2 [integer]  
Required: Yes

Command Parameters Extra: None
Callback Return Code and Intent Parameters

1. JUNOS_PULSE_RETURN_CODE_SESSION_DISCONNECTED [Value = 7]
   Intent Params: None
   Return code 7 indicates that VPN disconnect succeeded.

2. JUNOS_PULSE_RETURN_CODE_VPN_NOT_SUPPORTED [Value = 3]
   Intent Params: None
   Return code 3 indicates that VPN is not supported on this device. VPN using Junos Pulse is not supported on all devices. All pre-Android ICS, non-Samsung, non-Lenovo, non-plugin devices should return this status code. Junos Pulse for Android is supported on Android 2.1 and higher (API Level 7) devices. Devices that are running an earlier version of Android do not see Pulse on Google Play.

Explicit Intent API — VPN Check Status

Command Extra
Extra Name: “Junos Pulse Vpn Command”
Extra Value and Type: 3 [integer]
Required: Yes

Command Parameters Extra: None

Callback Return Code and Intent Parameters

1. JUNOS_PULSE_RETURN_CODE_VPN_CONNECTED [Value = 1]
   Intent Params:
   a. Extra Name: “Ipaddr”
      Extra Value and Type: Valid Gateway Url [String]
      Required: Yes
   b. Extra Name: “Starttime”
      Extra Value and Type: VPN Start Time [String]
      Required: Yes
   c. Extra Name: “Tx”
      Extra Value and Type: Bytes Sent [integer]
      Required: Yes
   d. Extra Name: “Rx”
      Extra Value and Type: Bytes Received [integer]
      Required: Yes

2. JUNOS_PULSE_RETURN_CODE_VPN_DISCONNECTED [Value = 2]
   Intent Params: None

3. JUNOS_PULSE_RETURN_CODE_VPN_NOT_SUPPORTED [Value = 3]
   Intent Params: None
   Return code 3 indicates that VPN is not supported on this device. VPN using Junos Pulse is not supported on all devices. All pre-Android ICS, non-Samsung, non-Lenovo, non-plugin devices should return this status code. Junos Pulse for Android is supported
on Android 2.1 and higher (API Level 7) devices. Devices that are running an earlier version of Android do not see Pulse on Google Play.

Pulse returns the following result code if any unsupported command is issued:

```
JUNOS_PULSE_RETURN_CODE_VPN_INVALID_COMMAND [Value = 5]
```

Intent Params: None

Return Code 5 indicates that the third-party app has called a VPN command value that is not supported.

**Explicit Intent API — Example**

```java
Intent intent = new Intent();
intent.setComponent(ComponentName.unflattenFromString("net.juniper.junos.pulse.android/ net.juniper.junos.pulse.android.ui.ExplicitIntentActivity"));
//Set the intent with authentication parameters like username, password.
JunosPulseActivityIntent.putExtra("Junos Pulse Vpn Command", 1);
JunosPulseActivityIntent.putExtra("Url", "connect4.juniper.net");
JunosPulseActivityIntent.putExtra("Username", "test");
JunosPulseActivityIntent.putExtra("Password", "password");
JunosPulseActivityIntent.putExtra("Realm", "Users");
startActivity(JunosPulseActivityIntent);
```

**Related Documentation**

Junos Pulse for Nokia Symbian Devices

Junos Pulse for Symbian

Junos Pulse can create an authenticated session between a device running Nokia Symbian and Pulse secure access service. Junos Pulse for Symbian devices uses IKEv2 (Internet Key Exchange) to set up a security association in the IPsec protocol suite. Junos Pulse enables secure connectivity to Web-based applications and data based on identity, realm, and role. Junos Pulse is available for download from the Nokia Ovi store.

The Junos Pulse Mobile Supported Platforms Guide, which is available at http://www.juniper.net/support/products/pulse/mobile/ lists the mobile device OS versions supported by Pulse and the security features supported on each mobile device OS.

The Nokia Symbian relies on IKEv2 authentication and that requires a certificate. Before you begin, be sure you have completed the following certificate configuration steps:

• Import the valid Device Certificate to the Secure Access Server.
  Configuration > Certificates > Device Certificate
• Import the Trusted Client CA certificate.
  Configuration > Certificates > Trusted Client CAs
• Import the Trusted Server Certificate
  Configuration > Certificates > Trusted Server CAs
• Configure a valid NC profile to work with IKEv2.

Configuring Pulse Secure Access Service for Junos Pulse on Symbian Devices

To enable access from a Symbian device to Pulse Secure Access Service, the device user must download and install the Junos Pulse app, and the Pulse administrator must configure specific realm and role settings on the Pulse server.

To configure Pulse Secure Access Service for Symbian device access:

1. Log in to the Pulse server admin console.
2. Select User Roles > New User Role.
3. On the New Role page, specify a name for the role and, optionally, a description. Make note of the name because later in this procedure, you create a realm and map realm users to this role.

4. In the Access Features section of the New Role page, select the IKEv2 check box.

5. Click Save Changes to create the role and to display the role configuration tabs.

6. Select Web > Bookmarks and then click New Bookmark.

   You must create bookmarks to enable the buttons that appear in the Pulse for Android user interface. Typically, you create a bookmark for your company intranet and for Web e-mail. You must create an e-mail bookmark to enable the e-mail button within the Pulse interface on the Android, and that e-mail bookmark must be named Mobile Webmail.

   ![Figure 17: Creating the E-mail Bookmark for the Pulse Client](image)

   NOTE: Alternatively, you can use Web resource policies to define the bookmarks.
NOTE: To ensure that users see consistent bookmarks in the Pulse client UI no matter which server they are connected to, you should configure and enable user record synchronization, a feature of the Pulse Secure Access Service platform.

7. To change default session time-outs, select General > Session Options.

8. In the Session lifetime section, specify Max. Session Length in minutes. The remaining session time appears on the Pulse interface of the mobile device client in the format **days hours:minutes:seconds**. The other session settings are not applied to mobile clients.

10. Specify a name and, optionally, a description. Then click Save Changes to create the realm and to display the realm option tabs.

11. On the Authentication Policy tab for the realm, click Host Checker and make sure that all Host Checker policies are disabled except for the optional Pulse Mobile Security check.

   You can require that mobile device users have Pulse Mobile Security software installed and enabled.

12. On the Role Mapping tab for the realm, create a new rule that maps all users to the Symbian device role you created earlier in this procedure.

Junos Pulse for Windows Mobile

Junos Pulse supports Secure Application Manager (SAM). SAM provides remote access using application names and destinations instead of network subnets. SAM does not require a virtual adapter or virtual IP address on the endpoint so SAM connectivity is secure. SAM provides access to client/server applications and thin client solutions without provisioning a VPN tunnel.

Junos Pulse can provide secure, application-level, remote access to enterprise servers from client applications on mobile endpoints that are running the Windows Mobile operating system. You can provide secure access to individual client/server applications, such as Lotus Notes, Microsoft Outlook, Citrix, and ActiveSync, as well as to application servers.

NOTE: Junos Pulse for Windows Mobile is available for download from the Juniper Web.

Pulse Release 1.0, 2.0, and 3.0 and Pulse SAM Connectivity

The SAM client software has evolved to meet the needs of different environments. Table 12 on page 196 describes the progression of Pulse/SAM client software.
### Table 12: Pulse/SAM Client Version Summary

<table>
<thead>
<tr>
<th>Pulse/SAM Version</th>
<th>Supported Platforms</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pulse R1.0</td>
<td>Windows Mobile</td>
<td>WSAM client that is installed from the Pulse Secure Access server.</td>
<td>Supports Host Checker.</td>
</tr>
<tr>
<td></td>
<td>Windows XP</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Windows Vista</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Windows 7</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Pulse R2.0</td>
<td>Windows Mobile (6.0, 6.1, and 6.5)</td>
<td>Pulse for Windows Mobile; available for download from juniper.net.</td>
<td>If you install the Pulse 2.0 mobile client on a Windows Mobile device that already has Pulse R1.0, the installation detects the presence of the old client and removes it prior to installing the new client. It also detects and removes Host Checker. Host Checker is not supported. If Pulse R2.0 for Windows Mobile is installed on a Windows Mobile device, the user should not use a browser to sign into a realm that has Pulse R1.0 enabled. Pulse R1.0 cannot detect if Pulse R2.0 for Windows Mobile is already installed, and so it prompts the user to install Pulse R1.0. <strong>NOTE:</strong> If Pulse R2.0 is installed on a Windows Mobile device, and the user connects to a role that has Host Checker enabled, the user is prompted to install Host Checker. However, if the user allows the installation, nothing happens. To avoid this scenario, you should create a separate role for Pulse R2.0 for Windows Mobile devices. Pulse 2.0 for Windows Mobile supports the optional Pulse Mobile Security Suite.</td>
</tr>
<tr>
<td>Pulse R3.0</td>
<td>Windows XP</td>
<td>Pulse R3.0 incorporates SAM functionality as a native Pulse connection method.</td>
<td>Supports Host Checker. <strong>NOTE:</strong> Host Checker is not supported in the use case where the user employs a browser on the mobile device to connect to the Pulse server Web portal.</td>
</tr>

The Junos Pulse Mobile Supported Platforms Guide, which is available at [http://www.juniper.net/support/products/pulse/mobile/](http://www.juniper.net/support/products/pulse/mobile/) lists the mobile device OS versions supported by Pulse and the Pulse Mobile Security Suite features supported on each mobile device OS.

**NOTE:** Pulse Secure Access Service also supports a Java-based SAM client (JSAM). The JSAM client can be deployed from Pulse Secure Access Service to any endpoint that supports Java.
Configuring Pulse Secure Access Service for Windows Mobile Endpoints

This section describes how to configure Junos Pulse Secure Access Service to support Pulse for Windows Mobile endpoints.

To enable SAM and configure a role for Windows Mobile endpoints:

1. Log in to the Pulse Secure Access Service admin console.
2. Select User Roles > New User Role.
3. On the New Role page, specify a name for the role and, optionally, a description. Make note of the name because later in this procedure, you create a realm and map realm users to this role.
4. In the Access Features section of the New Role page, select the Secure Application Manager check box and then select Windows version.

**NOTE:** In the Options section, do not enable Junos Pulse. If you select Junos Pulse and Secure Application Manager, Windows version, you enable the Pulse/SAM access method, which is used for Windows XP, Vista, and Windows 7. The Junos Pulse check box must be left cleared to enable the role for Pulse for Windows Mobile clients.

5. Click Save Changes to create the role and to display the role configuration tabs.
6. Select Web > Bookmarks and then click New Bookmark.

You must create bookmarks to enable the buttons that appear in the Pulse for Windows Mobile user interface. Typically, you create a bookmark for your company intranet and for Web e-mail. You must create an e-mail bookmark to enable the e-mail button within the Pulse for Windows Mobile app, and that e-mail bookmark must be named Mobile Webmail.
Figure 18: Creating the E-mail Bookmark for the Pulse Client

NOTE: Alternatively, you can use Web resource policies to define the bookmarks.

NOTE: To ensure that users see consistent bookmarks in the Pulse app no matter which server they are connected to, you should configure and enable user record synchronization, a feature of the Pulse Secure Access Service platform.

Most of the General and SAM tab options apply to Pulse for Windows Mobile clients. The following describes the role options that you can employ to manage Windows Mobile sessions.

General > Restrictions

Source IP—Control from which IP addresses users can access the Web portal sign-in page, be mapped to a role, or access a resource.

Browser—Allow or deny access to the role based on the browser’s user agent string.

Certificate—Allow all users or only users with a signed client-side certificate.
Host Checker—Check compliance with defined policies. You must first define appropriate Host Checker policies before you can assign them to the role.

**General > VLAN/Source IP**

VLAN and Select Source IP—To direct traffic to specific sites based on the role, you can define a source IP alias for each role, and then use the alias to configure virtual ports you define for the internal interface source IP address. A back-end device can then direct end user traffic based on the alias. This capability enables you to direct various end users to defined sites based on their roles, even though all of the end user traffic has the same internal interface source IP address.

Max. Session Length—A session can remain active for the number of minutes set in this option. The session ends when it reaches this limit. Idle Timeout, Reminder Time, and Enable Session Extension features are not applicable to Windows Mobile clients.

**General > Session Options**

Idle Timeout—The maximum time a session can remain idle (no traffic) before the server ends the session.

Max. Session Length—The maximum time for a session before the server ends the session.

Reminder Time—The number of minutes prior to a session end when the server notifies the user that the session will end soon.

Enable Session Extention—Not supported by the Pulse for Windows Mobile app.

**General > UI Options**

UI Options—The settings on this page define the Pulse Secure Access Service Web portal page.

**SAM > Applications**

Add Application—We recommend that you use resource profiles to specify the applications available to Pulse for Windows Mobile users, but you can use role and resource policy settings instead.

**SAM > Options**

Auto-uninstall Secure Application Manager—This feature is not applicable to the Windows Mobile client. Users must download and install Pulse for Windows Mobile before the Windows Mobile device can connect to the Pulse Secure Access Service.

Prompt for username and password for intranet sites—If you enable this option, the Pulse Secure Access Service requires users to enter sign-in credentials before connecting to sites on your internal network. This option changes Internet Explorer’s intranet zone setting so that Internet Explorer always prompts the user for network sign-in credentials for an intranet site.

Auto-upgrade Secure Application Manager—This feature is not applicable to the Pulse for Windows Mobile app.
Resolve only host names with domain suffixes in the device DNS domains—If you enable this option, users can only browse to Web sites that are part of their login domain.

Session start script and Session end script—This feature is not applicable to the Pulse for Windows Mobile app.

To use resource profiles to specify the applications available to Junos Pulse for Windows Mobile users:

1. Create resource profiles that enable access to client applications and destinations and configure the appropriate settings. Select Users > Resource Profiles > SAM > Client Applications.
2. Click New Profile.
3. From the Type list, select WSAM.
4. From the Application list, select one of the following options:
   - **Custom**—When you select this option, you must manually enter your custom application’s executable file name (such as telnet.exe). Additionally, you may specify this file’s path and MD5 hash of the executable file (although it is not required that you specify the exact path to the executable). If you enter an MD5 hash value, SAM verifies that the checksum value of the executable matches this value. If the values do not match, SAM notifies the user that the identity of the application could not be verified and does not forward connections from the application to the server.
   - **Lotus Notes**—Select this option to have SAM intermediate traffic from the Lotus Notes fat client application.
   - **Microsoft Outlook**—Select this option to have SAM intermediate traffic from the Microsoft Outlook application.
   - **NetBIOS file browsing**—Select this option to have SAM intercept NetBIOS name lookups in the TDI drivers on port 137.
   - **Citrix**—Select this option to have SAM intermediate traffic from Citrix applications.
   - **Domain Authentication**—Select this option to allow integrated Windows applications, such as file sharing, Outlook, and so forth to authenticate to the domain controller when the client machine is part of a domain. Before using this option, you must:
     - Specify domain controllers that are reachable through the Pulse Secure Access Service in the WSAM Destination list so that LDAP and Kerberos traffic can be proxied and sent to the Pulse server.
     - Configure a WSAM Access Control Policy to allow access to all domain controllers.

---

**NOTE:** You can configure access to a standard application once per user role. For example, you can enable one configuration of Microsoft Outlook and one configuration of Lotus Notes for the “Users” role.
5. Enter a unique name and optionally a description for the resource profile.

6. In the **Autopolicy: SAM Access Control** section create supporting auto policies and assign the policies to the role:
   
a. If it is not already enabled, select the **Autopolicy: SAM Access Control** check box.

   b. In the **Resource** field, specify the application server to which this policy applies. You can specify the server as a host name or an IP/netmask pair. You may also include a port.

   If you select Domain Authentication from the Application list, enter your domain controller server addresses into the Resource field. You can add multiple domain controller servers if more than one is available.

   c. From the Action list, select **Allow** to enable access to the specified server or **Deny** to block access to the specified server.

   d. Click **Add**.

7. Click **Save and Continue**.

8. In the Roles tab, select the roles to which the resource profile applies and click **Add**.

   The selected roles inherit the autopolicy created by the resource profile. If it is not already enabled, the server also automatically enables the SAM option in the roles General > Overview page for all of the roles you select.

9. Click **Save Changes**.

10. Select **Users > User Realms > New User Realm**.

11. Specify a name and, optionally, a description and then click **Save Changes** to create the realm and to display the realm option tabs.

12. On the Authentication Policy tab for the realm, click **Host Checker** and enable the optional Pulse Mobile Security check to require that mobile device users have Pulse Mobile Security software installed and enabled.

13. On the Role Mapping tab for the realm, create a new rule that maps all users to the Windows Mobile role you created earlier in this procedure.

---

**Configuring Host Checker for Windows Mobile Clients**

You can configure Host Checker to enforce policies for handheld devices, such as PDAs and smart phones, that run the Windows Mobile operating system. Host Checker rules include checks for ports, processes, files, registry key settings, operating system version, and certificates on the handheld device. You can also load and use installed third-party...
IMCs to perform vendor-specific checks. Once the policy is created, Host Checker deploys automatically when the user connects to the Pulse server Web portal. Host Checker does not require any configuration on the handheld device itself. When the server determines the device is out of compliance, Host Checker displays a notification icon in the system tray. Clicking this icon opens a browser page that contains reasons for the compliance failure and remediation instructions. Host Checker remains on the handheld device and does not need to be downloaded each time the user connects to the server. When the server upgrades to a newer version of Host Checker, the Windows Mobile device automatically updates the next time the user connects to the server. To remove Host Checker from the device, use the Remove Programs applet in the Settings panel of the device.

To create a Host Checker policy for Windows Mobile devices:

1. From the admin console, select **Authentication > Endpoint Security > Host Checker**.

2. In the Policies section, click **New** to open a New Host Checker Policy page.

3. Specify a name for the new policy and then click **Continue** to open the Host Checker Policy page.
   
   The name appears in lists when you implement the policy so be sure to use a descriptive name, such as **WinMobile HC Policy**.

4. Click the Mobile tab, and then click the Windows Mobile tab.

5. In the Rule Settings section, click **Select Rule Type**, select one of the following options, and then click **Add**:
   
   - **OS Checks**—To specify the Windows Mobile version that must be installed on the device.
   
   - **Ports**—Allows you to specify the ports numbers that can be used to access the server.
   
   - **Process**—Allows you to specify a specific process that must be running on the endpoint.
   
   - **File**—Allows you to verify the existence of a particular file on the endpoint.
   
   - **Registry Setting**—Check for a specific value in a registry setting.
   
   - **Machine Certificate**—Allows you to verify that the endpoint has a specific machine certificate installed. When validating a client-side CA certificate, the Pulse server checks that the certificate is not expired or corrupt and that the certificate is signed by a CA that the Pulse server recognizes.

6. After you have configured all of your rules, specify how you want to enforce them by choosing one of the following options:
   
   - All of the rules
   
   - Any of the rules
   
   - Custom
For Custom requirements, you can specify a custom expression using Boolean operators AND and OR and group and nest conditions using parenthesis.

7. Specify remediation options:
   - **Enable custom instructions**—If you enable this check box, a text box appears and allows you to type information that appears on the user’s device if Host Checker discovers an issue. For example, if you enabled the MSS rule that terminates the VPN session of Host Checker discovers a virus, you can instruct the user to run a virus scan to clear the issue before trying to connect.
   - **Kill processes**—Terminate specific processes on the endpoint.
   - **Delete files**—Delete specific files on the endpoint.
   - **Send reason strings**—Select this option to display a message to users (called a reason string) that is returned by Host Checker or integrity measurement verifier (IMV) and explains why the client machine does not meet the Host Checker policy requirements.

8. When you are finished, click **Save Changes**.

**Junos Pulse Mobile Security Overview**

The Junos Pulse Mobile Security Suite is an optional feature of the Pulse application for mobile devices. It provides mobile security and device management. It protects mobile devices against viruses, spyware, Trojans and worms, and includes tools to mitigate the risks of lost and stolen devices.

The Junos Pulse Mobile Security Suite provides the following features:

- **Antivirus**—Protects mobile devices against viruses and malware delivered via e-mail, Short Message Service (SMS), Multimedia Messaging Service (MMS), direct download, Bluetooth, or infrared transmission.
- **Firewall**—Protects users from threats by filtering and blocking TCP/IP traffic. A bidirectional, port-based and IP-based packet filtering option protects the mobile device from harmful or questionable content and prevents malicious content from being transferred to the device. The firewall monitors cellular data and WI-FI traffic.
- **Antispam**—Provides call and message filtering. Users can prevent interruptions and disturbances by blocking voice and SMS spam by customizing contacts into groups of blacklisted (blocked) numbers.
- **Device monitoring and control**—Provides real time content monitoring of SMS, MMS, and e-mail messages. The administrator can access call logs, address books, and even photos stored on the device.
- Loss and theft protection—Loss and theft protection features include remote lock, remote wipe, GPS tracking, backup and restore, remote alarms, and SIM change notification by means of commands run from the Pulse Mobile Security Gateway by the administrator.

- Backup and restore—Allows a user to back up the contacts and calendar PIM data stored on the device.

Device Management—The Pulse Mobile Security Gateway provides a management interface for managing and controlling mobile devices. The Pulse Mobile Security Gateway enables you to create user accounts and profiles, create rules and policies for devices, remotely execute features on the client, remove undesirable applications from devices, and generate reports related to malware detection and security levels. For more information, see the Junos Pulse Mobile Security Gateway documentation.
