

## Example: Access Privilege Configuration

---

Define access privileges:

```
[edit snmp v3]
access {
  group group1 {
    default-context-prefix {
      security-model usm {          #Define an SNMPv3 security model
        security-level privacy {
          notify-view nv1;
          read-view rv1;
          write-view wv1;
        }
      }
    }
  }
  group group2 {
    default-context-prefix {
      security-model usm {          #Define an SNMPv3 security model
        security-level authentication {
          read-view rv2;
          write-view wv2;
        }
      }
    }
  }
  group group3 {
    default-context-prefix {
      security-model v1 {          #Define an SNMPv3 security model
        security-level none {
          read-view rv3;
          write-view wv3;
        }
      }
    }
  }
}
```
