Example: Configuring Dynamic Source Translation (NAPT)

The following example configures dynamic source (address and port) translation, or NAPT:

```
[edit services nat]
pool public {
    address-range low 192.16.2.1 high 192.16.2.32;
    port automatic;
}
rule Private-Public {
    match-direction input;
    term Translate {
        then {
            translated {
                source-pool public;
                translation-type source dynamic;
            }
        }
    }
}
```

☞ **NOTE:** The only difference between the configurations for dynamic address-only source translation and NAPT is the inclusion of the **port** statement for NAPT.
