

Configuring the JUNOS Software to Ignore ICMP Source Quench Messages

By default, Internet Control Message Protocol (ICMP) source quench is disabled. You enable `source quench` when you want the JUNOS Software to ignore ICMP source quench messages. To do this, include the `source-quench` statement at the `[edit system internet-options]` hierarchy level:

```
[edit system internet-options]
source-quench;
```

To disable ICMP source quench, include the `no-source-quench` statement at the `[edit system internet-options]` hierarchy level:

```
[edit system internet-options]
no-source-quench;
```
