

Configuring Server Clusters

You configure server clusters as routing destinations by including the individual servers that constitute the cluster and assigning each a priority and weight. To configure server clusters:

1. Access the server cluster configuration option in the SIP routing destinations hierarchy and assign a name to the server cluster.

```
user@host# edit services border-signaling-gateway gateway bsg-1 sip  
routing-destinations clusters scl_1
```

2. Assign a server to the cluster.

```
[edit services border-signaling-gateway gateway bsg-1 sip routing-destinations  
clusters scl_1  
user@host# edit servers server_1
```

3. Set the priority and weight for the server.

```
[edit services border-signaling-gateway gateway bsg-1 sip routing-destinations  
clusters scl_1 server server_1  
user@host# set priority 5 weight 5
```

4. Repeat Step 2 and Step 3 until you have included all the servers for the cluster.
