

View Events

To view system log messages that record events occurring on your routing platform, click **Monitor>Events and Alarms>View Events**. The View Events page is displayed. This page provides an easy method to view the events recorded in the system log (also known as system log messages). By default, the View Events page displays a summary of the most recent 25 events, with severity levels highlighted in different colors.

The View Events page displays system log messages that record events occurring on the routing platform. Events recorded include those of the following types:

- Routine operations, such as creation of an Open Shortest Path First (OSPF) protocol adjacency or a user login into the configuration database
- Failure and error conditions, such as failure to access a configuration file or unexpected closure of a connection to a child or peer process
- Emergency or critical conditions, such as routing platform power-off due to excessive temperature

On the View Events page, you can also use filters to display relevant events. [\[Unresolved xref\]](#) lists the different filters, their functions, and the associated actions. You can apply any or a combination of the described filters to view the messages that you want to view. After specifying the filter or filters you want, click **Search** to display the filtered events.

For more information see [\[Unresolved xref\]](#).
