What's New in JSA 7.5.0 Update Package 7

For more information about what's new in JSA 7.5.0 Update Package 7, see [What's New Guide](#).

Installing the JSA 7.5.0 Update Package 7 Software Update

JSA 7.5.0 Update Package 7 resolves reported issues from users and administrators from previous JSA versions. This cumulative software update fixes known software issues in your JSA deployment. JSA software updates are installed by using an SFS file. The software update can update all appliances attached to the JSA Console.

The 7.5.0.20230822112654.sfs file can upgrade the following JSA versions to JSA 7.5.0 Update Package 7:

- JSA 7.3.2 (All versions from Fix Pack 3 to Fix Pack 7)
- JSA 7.3.3 (All versions from GA to Fix Pack 9)
- JSA 7.4.0 (All versions from GA to Fix Pack 4)
- JSA 7.4.1 (All versions from GA to Fix Pack 2)
- JSA 7.4.2 (All versions from GA to Fix Pack 3)
- JSA 7.5.0 (All versions prior to JSA 7.5.0 Update Package 7)

This document does not cover all the installation messages and requirements, such as changes to appliance memory requirements or browser requirements for JSA. For more information, see the [Juniper Secure Analytics Upgrading JSA to 7.5.0](#).

Ensure that you take the following precautions:

- Back up your data before you begin any software upgrade. For more information about backup and recovery, see the [Juniper Secure Analytics Administration Guide](#).
- To avoid access errors in your log file, close all open JSA webUI sessions.
- The software update for JSA cannot be installed on a managed host that is at a different software version from the Console. All appliances in the deployment must be at the same software revision to update the entire deployment.

- Verify that all changes are deployed on your appliances. The update cannot install on appliances that have changes that are not deployed.
- If this is a new installation, administrators must review the instructions in the [Juniper Secure Analytics Installation Guide](#).

To install the JSA 7.5.0 Update Package 7 software update:

1. Download the 7.5.0.20230822112654.sfs from the Juniper Customer Support website.
<https://support.juniper.net/support/downloads/>
2. Using SSH, log into your system as the root user.
3. To verify you have enough space (5 GB) in **/store/tmp** for the JSA Console, type the following command:
df -h /tmp /storetmp /store/transient | tee diskchecks.txt
 - Best directory option: **/storetmp**

It is available on all appliance types at all versions. In JSA 7.5.0 versions **/store/tmp** is a symlink to the **/storetmp** partition.
4. To create the **/media/updates** directory, type the following command:
mkdir -p /media/updates
5. Using SCP, copy the files to the JSA Console to the **/storetmp** directory or a location with 5 GB of disk space.
6. Change to the directory where you copied the patch file.
For example, **cd /storetmp**
7. Unzip the file in the **/storetmp** directory using the bunzip utility:
bunzip2 7.5.0.20230822112654.sfs.bz2
8. To mount the patch file to the **/media/updates** directory, type the following command:
mount -o loop -t squashfs /storetmp/7.5.0.20230822112654.sfs /media/updates
9. To run the patch installer, type the following command:
/media/updates/installer
10. Using the patch installer, select **all**.
 - The **all** option updates the software on all appliances in the following order:
 - Console
 - No order required for remaining appliances. All remaining appliances can be updated in any order the administrator requires.
 - If you do not select the **all** option, you must select your console appliance.

If your Secure Shell (SSH) session is disconnected while the upgrade is in progress, the upgrade continues. When you reopen your SSH session and rerun the installer, the patch installation resumes.

Installation Wrap-up

1. After the patch completes and you have exited the installer, type the following command:

```
umount /media/updates
```

2. Clear your browser cache before logging in to the Console.
3. Delete the SFS file from all appliances.

Results

A summary of the software update installation advises you of any managed host that were not updated. If the software update fails to update a managed host, you can copy the software update to the host and run the installation locally.

After all hosts are updated, administrators can send an email to their team to inform them that they will need to clear their browser cache before logging in to the JSA.

Clearing the Cache

After you install the patch, you must clear your Java cache and your web browser cache before you log into the JSA appliance.

Before you begin

Ensure that you have only one instance of your browser open. If you have multiple versions of your browser open, the cache might fail to clear.

Ensure that the Java Runtime Environment is installed on the desktop system that you use to view the user interface. You can download Java version 1.7 from the Java website: <http://java.com/>.

About this task

If you use the Microsoft Windows 7 operating system, the Java icon is typically located under the Programs pane.

To clear the cache:

1. Clear your Java cache:
 - a. On your desktop, select **Start > Control Panel**.
 - b. Double-click the Java icon.
 - c. In the Temporary Internet Files pane, click **View**.
 - d. On the Java Cache Viewer window, select all **Deployment Editor entries**.
 - e. Click the Delete icon.
 - f. Click **Close**.
 - g. Click **OK**.
2. Open your web browser.
3. Clear the cache of your web browser. If you use the Mozilla Firefox web browser, you must clear the cache in the Microsoft Internet Explorer and Mozilla Firefox web browsers.
4. Log in to JSA.

Known Issues and Limitations

The known issues addressed in the JSA 7.5.0 Update Package 7 are listed below:

- After upgrading to JSA 7.5.0 Update Package 5, WinCollect 7.X agents can experience management or configuration change errors.
- It is possible for autoupdates to revert to a previous version of autoupdates after upgrading. This will cause autoupdate to not work as intended.

After you upgrade to JSA 7.5.0 or later, type the following command to check your autoupdate version:

```
/opt/qradar/bin/UpdateConfs.pl -v
```

- Docker services fail to start on JSA appliances that were originally installed at JSA release 2014.8 or earlier, then upgraded to 7.5.0 Update Package 2 Interim Fix 02 or 7.5.0 Update Package 3.

Before you upgrade to JSA 7.5.0 Update Package 2 Interim Fix 02, run the following command from the JSA Console:

```
xfs_info /store | grep ftype
```

Review the output to confirm the ftype setting. If the output setting displays "ftype=0", do not proceed with the upgrade to 7.5.0 Update Package 2 Interim Fix 02 or 7.5.0 Update Package 3.

See [KB69793](#) for additional details.

- After you install JSA 7.5.0, your applications might go down temporarily while they are being upgraded to the latest base image.
- After upgrading some apps remain in "error" state on deployments with more than 30 apps. Restart the apps by using the qappmanager: **/opt/qradar/support/qappmanager**.
- When adding a Data Node to a cluster, they must either all be encrypted, or all be unencrypted. You cannot add both encrypted and unencrypted Data Nodes to the same cluster.

Resolved Issues

The resolved issues addressed in the JSA 7.5.0 Update Package 7 are listed below:

- Reports generate with incorrect chart data and column name with some advanced searches (AQL).
- Log sources deleted from within log source groups can still appear in the JSA user interface.
- "There was a problem saving the log source type configuration" after clicking save on the DSM editor page.
- JSA content pack can cause offenses to be triggered off of source IP instead of custom event property configured in rule.
- Reports can be sent to user addresses in "multiple reports" option when "single report option" is selected.
- Benign error similar to the following is visible in patches.log file can be observed during or after a JSA patch or upgrade.

Error: display callback failed: 'ascii' codec can't encode character u'\u2018' in position 0: ordinal not in range.

- JSA patching can fail due to disk space requirements when adequate space is available.
- Routing rule displays a blank page when the install is a software appliance on JSA 7.5.0 Update Package 1.
- Performance issues can occur when JSA attempts a reload of sensor devices when log sources exceed 2 million.

- Scheduled weekly or monthly reports display "no data for chart" after upgrading to JSA 7.5.0 Update Package 5.
- App install fails during docker build with "an exception occurred while waiting for task to complete" error.
- Sorting by column in the offenses tab removes search filters.
- Tomcat might go out of memory during deployments when the user has millions of log sources.
- System notification displays incorrect message when the tomcat certificate is due to expire.
- Poor scalability in reference data cache resulting in degrading search performance when using filters and tests.
- Users unable to export license information from JSA console gui.
- JSA asset creation events can display a generic identity:0 in the created by field for asset profiler events.
- Upgrade can complete and display an error about a custom properties script trying to insert or update a table.
- Offense search can add unexpected filters to the current search parameters after closing an offense.
- Services can experience out of memory issues due to large certificate revocation lists (CLRS).
- Reports tab can display as blank if the template file for a removed user is missing.
- Rule wizard cannot transition to the next page properly when rule response updates a reference table.
- JSA system anomaly detection engine (ADE) rules can generate extra rules when modified multiple times.
- Anomaly rule enabling "test the [this accumulated property] value of each log source separately" displays application error.
- Offense summary for match count rules does not return all results for the event/flow count field.
- Rule tests with multiple reference set values can display "an error has occurred saving your rule".
- Flow processors in different domains can experience connection issues.
- Upgrading a detached app host appliance fails as the upgrade is waiting on docker and conman services.
- Standby HA appliances can run keystore certificate validator on inactive hosts causing benign log messages.

- Log activity tab can display event ID and category as N/A when the payloads are parsed and mapped correctly.
- Users cannot open the rules wizard from the offenses tab on JSA 7.5.0 Update Package 6.
- Applications might fail to restart after apphost upgraded from JSA 7.5.0 Update Package 5 to JSA 7.5.0 Update Package 6.
- Unknown or stored events can route incorrectly to the sim generic log source in JSA 7.5.0 Update Package 4 and later.
- Reference data import fails with number format exception due to invalid number converter.
- Risks tab might not load after an upgrade to JSA 7.5.0 Update Package 6.
- Events can stop processing when pipeline disk monitor detects the disk spillover threshold is crossed.
- Reports that use the "include date in email subject only" does not behave as expected.
- Ariel processes might not allocate enough memory for memory-heavy operations, causing slower searches.
- Advanced searches (AQL) that use the "in" operator do not use indexes as expected.
- Rule wizard for ADE rules does not preserve the state of the "test separately" check box.
- Scheduled daily reports do not generate on a weekend as expected.
- JSA cannot log in while the LDAP server is unresponsive, which can lead to tomcat errors.
- PCAP data not stored in Ariel or displayed after an upgrade to JSA 7.5.0 Update Package 2 or later.
- JSA applications can get stuck in an error state after an upgrade to JSA 7.5.0 Update Package 6.
- The tzdata DST rules for America/Santiago are out of date and have the incorrect date for switchover to DST.
- Flow processor services can experience service start or restart issues due to libpcap update for older avx2 processors.
- User management window does not display as expected from the Admin tab when the language preference is non-English.
